    - .1 Provide code rated water relief valve, located in piping near bottom of each tank. Set relief pressures to maintain 70 kPa (10 psi) at highest point in system with pumps off.
    - .2 Relief valve for steam generated hot water system to be same model and size as relief valve used on heating convertor in system.
    - .3 Relief valve of chilled water system expansion tank: minimum 20 mm size.
  - .4 Drains:
    - .1 Pipe relief valve, relief connection on backflow preventer, and relief connection on make-up assembly to nearest open drain.
  - .2 Pressure Safety Relief Valves
    - .1 Install on hot water boilers, heating convertors, expansion tanks and other pressure vessels in accordance with relevant codes.
    - .2 Pipe outlets to drain.
  - .3 Pressure Reducing Valves
    - .1 Install pressure reducing valve stations with shut-off valve on either side of assembly and 115 mm pressure gauges on upstream and downstream sides of station
- 3.4 **FLUSHING OF PIPING SYSTEMS**
- .1 Applicable Systems
    - .1 Flush hydronic piping systems in accordance with Section 23 05 23.
      - .1 Flush water piping with water flowing at a velocity of not less than 1.8 m/sec, for a period of fifteen minutes or longer as required to remove all dirt, scale, and cuttings from the entire length of the piping.
    - .2 Thoroughly clean, prior to fabrication, sections of new piping which cannot be isolated for flushing purposes
    - .3 Thoroughly clean, insofar as possible, welded joints by swabbing interior of pipe with swabs soaked with a caustic solution.

End of Section

- 1 General
  - 1.1 **SUMMARY**
    - .1 Section Includes
      - .1 Labour, Products, equipment and services necessary to complete the Work of this section.
  - 1.2 **SUBMITTALS**
    - .1 Shop Drawings
      - .1 Submit Shop Drawings in accordance with Section 01 33 00.
    - .2 Operation and Maintenance Data:
      - .1 Submit printed operation instructions and maintenance data in accordance with Section 01 33 00.
- 2 Products
  - 2.1 **MATERIALS**
    - .1 Minimum General Requirements
      - .1 The following are minimum construction requirements, unless specified elsewhere.
      - .2 Pump casings:
        - .1 Close grained cast iron or cast bronze as specified.
        - .2 Fitted with casing or impeller wear rings, or both.
      - .3 Impellers:
        - .1 Enclosed bronze or duralloy.
        - .2 Dynamically balanced.
        - .3 Mounted on carbon steel shaft fitted with stainless steel or bronze sleeves.
      - .4 Seals:
        - .1 Suction pressures less than 700 kPa (100 psi): Fitted with mechanical seals.
        - .2 Stuffing box pressure in excess of 690 kPa (100 psig): Balanced type seals.
        - .3 Pumps with packing glands: Fitted with stainless steel shaft sleeves for full length of stuffing box.
      - .5 Performance:
        - .1 Characteristic curve to be continuously rising to from run-out to shut-off.

- .2 Select pump to operate within flow range from 30% below point of maximum efficiency to 10% above that point for impeller diameter chosen.
- .3 Installed impeller diameter not to exceed 90% of maximum impeller diameter catalogued for pump casing.
- .4 Motors to be sized for continuous operation without motor overload at runout condition for impeller size and rotational speed selected.

## 2.2 **IN-LINE STANDARD DUTY CIRCULATING PUMPS (IN-LINE CIRCULATORS)**

### .1 Construction

- .1 Volute: Cast iron or bronze, with screwed or flanged suction and discharge connections.
- .2 Impeller: (cast bronze,) (stamped brass,) (alloy steel) (or cast iron).
- .3 Shaft: Alloy steel or stainless steel with bronze sleeve bearing and integral thrust collar.
- .4 Seal assembly: Mechanical.
- .5 Flexible self-aligning coupling.
- .6 Resilient mounted, drip proof, sleeve bearing motor.

### .2 Manufacturer

- .1 S.A. Armstrong Models "S" and "H"
- .2 ITT Fluid Products - Bell & Gossett Series 100
- .3 Taco 110

## 2.3 **IN-LINE COMMERCIAL DUTY CIRCULATING PUMPS (HIGH FLOW IN-LINE CIRCULATORS)**

### .1 Construction

- .1 Volute: Cast iron or bronze, with tapped openings for venting, draining, pressure gauges, and with screwed or flanged suction and discharge connections.
- .2 Impeller: (Cast bronze,) (Stamped brass,) (Alloy steel) (Cast iron).
- .3 Shaft: Alloy steel or stainless steel with bronze sleeve bearing and integral thrust collar.
- .4 Seal assembly: Mechanical.
- .5 Flexible self-aligning coupling.
- .6 Resilient mounted, drip proof, sleeve bearing motor.

### .2 Manufacturer

- .1 S.A. Armstrong Series 1020, 1050
- .2 ITT Fluid Products - Bell & Gossett Series 60
- .3 Taco Series 1600

## 2.4 **SINGLE SUCTION CENTRIFUGAL PUMP**

### .1 Construction

- .1 (Bronze fitted) (All iron) (All bronze) (All stainless steel) type.
- .2 Common cast iron or fabricated steel base with drip rim and tapping for drain connection.
- .3 Impeller: Bronze, cast iron, or stainless steel enclosed dynamically balanced, keyed to shaft and secured with locking nut or screw.
- .4 Alloy steel or stainless steel shaft with two point support and sleeve bearings.
- .5 Bronze, cast iron, or stainless steel enclosed dynamically balanced impeller keyed to shaft and secured with locking nut or screw.
- .6 Cast iron, bronze or stainless steel radially split end suction volute with flanged suction and discharge, drain plug, vent cock and suction and discharge pressure gauge tapings.
- .7 Mechanical seal or packing gland with hardened wear rings and drip pocket piped to base gutter.
- .8 Positive seal flushing system with valved copper piping from pump discharge to stuffing box and cyclone separators for pump heads up to 2400 kPa (800 ft) or 50 micron filters on pumps subject to dynamic heads of less than 160 kPa (55 ft) and ball type flow indicators.
- .9 Flexible self-aligning coupling.

### .2 Manufacturers:

- .1 S.A. Armstrong
- .2 ITT Bell & Gossett
- .3 Aurora
- .4 Taco-Leitch

## 2.5 **SINGLE SUCTION CLOSE COUPLED VERTICAL-IN-LINE CENTRIFUGAL PUMP**

### .1 Construction

- .1 (Bronze fitted) (All iron) type.
- .2 Cast iron casing with motor mounting flange and drip rim and tapping for drain connection.
- .3 Alloy steel or stainless steel shaft.
- .4 Bronze, cast iron, or stainless steel enclosed dynamically balanced impeller keyed to motor shaft and secured with locking nut or screw.
- .5 Cast iron radially split end suction volute with flanged suction and discharge, drain plug, vent cock and suction and discharge pressure gauge tapings.
- .6 Mechanical seal with positive seal flushing system consisting of valved copper piping from pump discharge to stuffing box and cyclone separators for pump

heads up to 2400 kPa (800 ft) or 50 micron filters on pumps subject to dynamic heads of less than 160 kPa (55 ft) and ball type flow indicators.

.2 Manufacturer

- .1 S.A. Armstrong
- .2 ITT Bell & Gossett
- .3 Aurora
- .4 Taco-Leitch

2.6 **SPECIAL APPLICATIONS:**

.1 Hot Water Heating

- .1 End suction, close coupled type.
- .2 May use packing gland provided gland, nuts are of bronze construction, gland bolts are stainless steel.
- .3 Packing suitable for application temperature.
- .4 Rotary type mechanical seals must be rated for 104°C (220°F) operating temperature.

.2 Condensate Pump

- .1 Centrifugal type.
- .2 Seal ratings: 100°C (212°F).
- .3 Pump impeller hydraulically balanced.

3 Execution

3.1 **INSTALLATION**

.1 General

- .1 Make piping and electrical connections to pumps.
- .2 Check pump rotation.
- .3 Set up and adjust controls.
- .4 Pipe drain tapping to drain.
- .5 Install gauges.

.2 Base Mounted Pumps

- .1 Supply templates for anchor bolt placement, dimension layouts for pump bases and furnish anchor bolts with sleeves.
- .2 Place pumps level on concrete base; dowel, shim and grout with minimum 13 mm grout.
- .3 Fill hollow portion of bases with concrete.
- .4 Align couplings before and after piping connections have been made.

.5 Check oil level and lubricate.

.6 Tighten glands after run-in.

.3 In-Line Circulators

.1 Install with fluid flow direction as indicated by flow arrows on pump body.

.2 Support piping and pump at flanges or near unions on connections to unit.

.3 Install with bearing lubrication points accessible.

.4 Check pump rotation.

.4 Vertical In-Line Pumps

.1 Support pump from stanchions or hangers on suction and discharge piping.

.2 Install volute venting pet cock in accessible location.

.3 Check pump rotation.

End of Section

(THIS PAGE INTENTIONALLY LEFT BLANK)

- 1 General
  - 1.1 **SUMMARY**
    - .1 Section Includes
      - .1 Labour, Products, equipment and services necessary to complete the Work of this section.
  - 1.2 **SUBMITTALS**
    - .1 Shop Drawings
      - .1 Submit Shop Drawings in accordance with Section 01 33 00.
  - 1.3 **COORDINATION**
    - .1 Prepare coordination and fabrication drawings at a minimum scale of 1:50 ¼"=1'-0" and coordinate with other trades affected by this Work to ensure access to other portions of the Work is not impeded by the duct work systems.
    - .2 Maintain these Drawings on site and make them available for review by the Owner's Representative when requested.
  - 1.4 **PROJECT CONDITIONS**
    - .1 Environmental Requirements
      - .1 Maintain a space work temperature not less than the minimum ambient working temperature as required by the duct sealant manufacturer requirements. Any duct work sealant installed where the space temperature is less than these recommendations will be removed and replaced.
    - .2 Field Measurements
      - .1 In existing buildings, make detailed field measurements for routing of new duct work, and provide all offsets and transitions which may be required to accommodate the new work with existing and new services.
    - .3 Protection
      - .1 Temporarily cap-off duct work openings to protect against dirt accumulation inside the duct work.
- 2 Products
  - 2.1 **DUCT WORK**
    - .1 Materials
      - .1 Galvanized steel sheet
        - .1 Z275 (G90) for unpainted duct work, indoor
        - .2 Z275 (G90) for outdoor duct work
        - .3 ZF075 (A25) designation zinc coating to ASTM A653/A653M for painted duct work
      - .2 Stainless steel sheet

- .1 Type 304L / Type 316L to ASTM A167
  - .3 Flexible duct work
    - .1 ULC approved, insulated double wall polymeric liner bonded to mechanical lock spiral joints
      - .1 Thermoflex M-KE
      - .2 Flexmaster
  - .4 Metal duct sealant – high velocity duct sealer
    - .1 3M EC800
    - .2 Foster #30-02
    - .3 Hardcast Iron Grip #601
    - .4 Duro-Dyne S-2
    - .5 Transcontinental Equipment "MP".
- 3 Execution
- 3.1 **DUCT WORK**
  - .1 General
    - .1 Install duct work in arrangement shown on Drawings in accordance with standards and recommended practices of ASHRAE and SMACNA. Provide required offsets and transitions, whether specifically indicated or not, to facilitate duct installation and to avoid interference with building structure, piping, equipment and services.
    - .2 Duct sizes as shown on Drawings. Where ducts are to have internal acoustical liner, adjust duct size to accommodate acoustic liner thickness; clear inside dimensions as shown on Drawings.
    - .3 Fabricate duct work free from vibration, rattle or drumming under operating conditions; reinforce, brace, frame, place gaskets, etc. to comply with performance criteria.
    - .4 Place galvanized screens of 13 mm x 13 mm mesh x 2.7 mm diameter wire for air intakes, exhausts and open ends of duct work.
    - .5 Install duct work in locations and at elevations appropriate to ceiling heights shown on Drawings. Where required to be concealed, install duct work in furred spaces provided in walls and ceilings. Where there is no provision for concealment install duct as close as possible to walls, partitions and overhead structures to attain maximum headroom and clearance.
    - .6 Where shape of duct changes, install transition piece so that angle of side of transition piece does not exceed fifteen degrees from straight run of duct being connected, unless shown otherwise on Drawings.
  - .2 Pressure Class/Seal Class
    - .1 Fabricate duct work to SMACNA pressure classification as follows unless otherwise noted on Drawings.

- .2 Seal duct work in accordance with SMACNA sealing requirements as follows:
  - .1 Seal Class "A": All transverse joints, longitudinal seams, and duct wall penetrations.
  - .2 Seal Class "B": All transverse joints, and longitudinal seams only.
  - .3 Seal Class "C": Transverse joints only.
  - .4 Seal Class "D": None.

System	Pressure Class	Sealing Class
Constant Volume Supply	+3" (750 Pa)	A
Variable Volume Supply, upstream of VAV boxes	+3" (500 Pa)	A
Variable Volume Supply, downstream of VAV boxes	+1" (250 Pa)	A
Building Return Air	+/-2" (500 Pa)	A
Building Exhaust (washroom exhaust, general exhaust)	+/-2" (500 Pa)	A
Fire Rated (exhaust)	+/-3" (750 Pa)	A
Kitchen Exhaust	-4" (1000 Pa)	A
Other Process Exhaust Systems	-4" (1000 Pa)	A

- .3 Sleeves
  - .1 Install sleeves where ducts pass through walls or floors. Pack space between duct and sleeve with mineral wool and seal both ends with non-flammable fire resistant sealing compound. Install sheet metal closure plates on each side of wall to cover sleeve.
  - .2 Sleeves: Of the same sheet material and thickness as for duct work.
- .4 Air Intakes and Exhausts
  - .1 Install removable galvanized screens securely fastened in place at air intakes, exhausts and open ends in duct work.
- .5 Equipment Connections
  - .1 Install neoprene gasketed flanged joints at duct connections to air conditioning units, coils, etc. Fabricate flanges from mild steel angles to match equipment flanges.
  - .2 Install air terminal units (TU) and silencers (S) independent of duct work, with rods or angles of sizes adequate to support load.
- .6 Paint Finish and Touch-Up
  - .1 In office areas paint interior of duct work for at least 300 mm behind supply and exhaust grilles with matte black paint to render duct work invisible from occupied space.
  - .2 Touch-up galvanized steel damaged as a result of fabrication, including welding, with zinc dust galvanized primer.
- .7 Supports and Hangers
  - .1 Support intervals:
    - .1 Ducts up to 1.5 m in width: Minimum 2.4 m centres.

- .2 Ducts 1.5 m in width and over: 1.2 m centres.
- .2 Strap hangers:
  - .1 For duct size up through 760 mm width.
  - .2 3 mm x 25 mm mild steel bar stock. Bend strap hanger around bottom of duct for a minimum of 38 mm and attach to sides and bottom of duct.
- .3 Steel angle hangers:
  - .1 For duct sizes over 760 mm in width.
  - .2 Mild steel rod hangers of 10 mm diameter minimum size, with 38 mm x 38 mm x 3 mm steel angle across bottom of duct and attach hanger to angle (not the duct).
- .4 Install miscellaneous steel angles or channels as required between joists or building steel for structural support of duct where building framing spacing does not coincide with the required hanger spacing.

### 3.2 **RECTANGULAR DUCT WORK**

- .1 General
  - .1 Material: Galvanized steel for unpainted duct work, unless otherwise shown on Drawings.
  - .2 Metal thickness and construction methods as specified herein for various size ranges of ducts.
  - .3 Cross-break flat surfaces of uninsulated duct between joints, or between joints and intermediate reinforcements, to prevent vibration or buckling.
  - .4 Seal joints on all rectangular duct work with high velocity duct sealer. Duct-tape will not be allowed.
- .2 Joints
  - .1 Longitudinal joints: Pittsburgh Lock joints tightly closed along full length of seam.
  - .2 Transverse joints: Ductmate, Nexus or TDC connections of class to suit size of duct and pressure of system.
- .3 Fittings
  - .1 Elbows, transition sections and take-off fittings: Use metal one gauge heavier than thickness specified for duct in which they are installed.
  - .2 Radius elbows: Standard radius design with inner radius equal to width of elbow unless shown otherwise, Pittsburgh Lock seams, and with ends to match transverse joints of duct.
  - .3 Square elbows: Where elbows are shown as square type, fit elbows with air turning vanes of double blade construction.

### 3.3 **ROUND DUCT WORK**

- .1 General

- .1 Shop-fabricate round duct work from helically wound galvanized steel sheet strips with spiral lock seam, of following thicknesses:

Duct Diameter	Thickness of Sheet Metal
200 mm or less	0.5 mm (26 ga.)
228 mm to 560 mm	0.6 mm (24 ga.)
600 mm to 810 mm	0.8 mm (22 ga.)
860 mm to 1010 mm	1 mm (20 ga.)
1060 mm and up	1.3 mm (18 ga.)

- .2 In lieu of standard spiral lock seam duct work, "Uni-Rib" duct as manufactured by United Sheet Metal may be furnished for above floor installations in sizes 375 mm and larger.

- .3 Secure joints with sheet metal screws and seal with approved sealant.

.2 Joints

- .1 Longitudinal seam: Spiral wound seam type RL-1 (grooved lock) or RL-4 (butt weld)

- .2 Transverse seam: Van Stone flange joint RT-2 or RT-2A

- .1 Exception: Downstream of VAV boxes flange joint type RT-1 (beaded sleeve joint) may be used, with minimum three mechanical fasteners each side of joint.

- .3 Seal joints in round duct work with high velocity duct sealer as specified for rectangular duct work.

.3 Fittings

- .1 Ninety degree elbows: Smooth centre line radius of one and one-half times duct diameter. Alternatively, use elbows of five piece construction, subject to prior approval of Consultant.

- .2 Forty-five degree elbows: Use three piece construction.

- .3 Branch connections to mains: Eccentric conical configuration.

3.4 **SPECIALTY DUCT WORK SYSTEMS**

.1 Flexible Type Round Ducts

- .1 Provide flexible duct work as follows:

- .1 Between trunk supply duct and air terminal units, VAV boxes.  
 .2 At connection to certain ceiling diffusers.  
 .3 Where shown on Drawings.

- .2 Use insulated type flexible duct work in non-return air plenums.

- .3 Use non-insulated type flexible duct work in return air plenums.

- .4 Seal joints between flexible duct and rigid duct work or equipment with non-flammable high velocity duct sealer, applied in accordance with duct

manufacturer's recommendations, and make secure with gear type nylon strap connectors.

.2 Fire Rated Duct Work

- .1 Construct and support fire rated duct work in strict conformance with the ULC listing requirements for two-hour fire rating.
- .2 Where duct construction or support is not covered by ULC listing requirements, construct and support duct work as for rectangular duct work, specified herein.

.3 Waterproof Duct Work

- .1 Slope fresh air intake ducts down at 1:100 to permit moisture induced by air intake to be drained. Install 38 mm drain flange in bottom of duct at low point. Continuously solder or seal joints in exterior air intake duct to prevent dripping of moisture through joints.
- .2 In areas having high humidity, fabricate exhaust duct work without seams in bottom of duct for at least 3 m of duct run behind register and slope duct up away from register.

.4 Kitchen Exhaust Hood Duct Work

- .1 Fabricate duct work, access door and cleanouts in accordance with NFPA 96.
- .2 Material: 1.6 mm (16 gauge) black steel (or stainless steel) with externally welded seams, and flanged and gasketed joints at hood and fan.

3.5 **INSPECTION, TESTING AND BALANCING**

.1 Cleaning

- .1 Prior to start-up of fans, blow out complete systems of duct work with high velocity air for not less than two hours using, where possible, the installed air handling equipment to full capacity and by blanking off duct sections to achieve required velocity. Do not install air filters prior to blow-out of duct work systems. Use auxiliary portable blowers for cleaning where installed fan systems are not adequate to blow out complete system free from dust and dirt.
- .2 After duct systems have been blown out, clean interior of plenums, coils, and register, grille or diffuser outlet collars with industrial type vacuum cleaner. On completion of cleaning process, install filters before placing systems in final operation.

.2 Balancing of Air Systems

- .1 Balance air handling systems in accordance with Section 23 08 16.

End of Section

(THIS PAGE INTENTIONALLY LEFT BLANK)

- 1 General
  - 1.1 **SUMMARY**
    - .1 Section Includes
      - .1 Labour, Products, equipment and services necessary to complete the Work of this section.
  - 1.2 **RELATED SECTIONS**
    - .1 Division 25: Integrated automation:
      - .1 Automatic control damper operators
      - .2 Automatic control dampers
  - 1.3 **SUBMITTALS**
    - .1 Shop Drawings
      - .1 Submit Shop Drawings in accordance with Section 01 33 00.
- 2 Products
  - 2.1 **DUCT WORK ACCESSORIES**
    - .1 Flexible Duct Connections
      - .1 Material:
        - .1 Heavy glass fabric double coated with neoprene and attached to 0.6 mm (24 ga) metal strips 75 mm wide.
        - .2 Fabric length between metal strips:
          - .1 Minimum 75 mm for ducts of maximum size in either dimension or diameter of 750 mm or less
          - .2 150 mm for ducts of 775 mm size and larger.
      - .2 Acceptable Manufacturers:
        - .1 Duro-Dyne "Grip-Loc Type SMFN"
        - .2 Ventfabrics "Ventglas"
    - .2 Turning Vanes
      - .1 Material: Hollow airfoil type, fabricated of same material as duct in which they are installed.
      - .2 Acceptable Manufacturers:
        - .1 Duro-Dyne
    - .3 Access Doors in Duct Work and Plenums
      - .1 Hand door:
        - .1 Construction: 0.7 mm (24 ga) galvanized steel, double flanged frame and insulated door complete with insulation backing plate.

- .2 Fasteners: Zinc plated cam-lock fasteners, minimum two per door, with safety retaining chain.
  - .2 Equipment and man doors:
    - .1 Minimum size, equipment: Where motors are installed within unit or duct, use an access door large enough to permit removal of motor.
    - .2 Minimum size, man door: 450 mm x 1.2 m or as shown on Drawings.
    - .3 Construction: 0.8 mm (22 ga) thick galvanized steel sheet double panel construction with approved 25 mm thick insulating filler, mounted in flanged die-formed collar flush with face of finished insulation, with flanged door frames welded in place.
    - .4 Hinges: Heavy zinc plated continuous hinge.
    - .5 Fasteners: Three heavy sash fasteners and neoprene gaskets.
  - .4 Probe Inlets
    - .1 Material:
      - .1 Ventlok No. 699 or Duro-Dyne IP-1 or IP-2 Test Opening Enclosures complete with locking cap, chain, gaskets, insulating plug and extensions for insulated duct work.
- 2.2 **OPERATING DAMPERS**
  - .1 Automatic Control Dampers
    - .1 General:
      - .1 Modulating control dampers: Opposed blades.
      - .2 Two position control dampers: Parallel blades.
    - .2 Damper blades and frames:
      - .1 Extruded aluminum 6063-T5
      - .2 Maximum blade length: 1.2 m without internal frame support.
      - .3 Maximum blade length: 1.2 m without internal frame support.
      - .4 Blade edge seals: EPDM gaskets.
      - .5 Frame side seals: Extruded TPE or cambered stainless steel.
      - .6 Frame style: Flanged to duct.
      - .7 Jack shaft: Extendable, combination of aluminum, and zinc/nickel coated steel.
      - .8 Damper leakage: 50 L/s per m<sup>2</sup> damper face area at 1 kPa differential static pressure.
    - .3 Bearings:
      - .1 Thermal plastic resin copolymer, nylon or oil impregnated bronze.
      - .2 At blade axles, linkage devices, etc.

- .4 Damper blades and frame for outside exhaust and intake air applications:
  - .1 As above.
  - .2 Operating temperature: -40°C to +100°C (-40°F to +212°F).
  - .3 Thermally broken and insulated blades; expanded polyurethane foam insulation.
  - .4 Damper leakage: 21 L/s per m<sup>2</sup> damper face area at 1 kPa differential static pressure.
- .5 Acceptable Manufacturer:
  - .1 Tamco - Series 1000
  - .2 Nailor Industries - Series 2000
  - .3 Tamco - Series 9000 (exhaust and air intake applications)
  - .4 Nailor - Series 2000IBF (exhaust and air intake applications)
  - .5 Ventex Alumavent
- .2 Manual Balancing Dampers
  - .1 Rectangular duct work:
    - .1 Galvanized channel type frames, non-binding pre-lubricated type interconnecting and operating linkages.
    - .2 Blades: Minimum 1.6 mm (16 ga) thick material, opposed blade style.
    - .3 Manual operator and locking type quadrant as required for synchronous operation and setting of blades.
    - .4 Blade width: Maximum 200 mm.
    - .5 Blade length: Length coinciding with frame opening on horizontal plane to maximum length of 1.2 m.
    - .6 Locking quadrant: Galvanized steel locking quadrant with "Open – Closed" labels, 50 mm insulation stand-off.
    - .7 Acceptable Manufacturers:
      - .1 Nailor – Series 1810/1820 with HL2 quadrant
      - .2 Ventex Alumavent
  - .2 Round duct work - medium pressure butterfly damper:
    - .1 Galvanized steel frame 0.9 mm (22 ga) with stiffening beads up to 300 mm diameter; 0.9 mm (20 ga) over 300 mm duct size.
    - .2 Blade: Laminated galvanized steel 0.9 mm (22 ga), or single layer of 1.6 mm (16 ga), open and closed end stops, Celcon bearings, polyethylene blade edge seal, 13 mm diameter drive shaft.
    - .3 Locking quadrant: Galvanized steel locking quadrant with "Open – Closed" labels, 50 mm insulation stand-off.

- .4 Acceptable Manufacturers:
  - .1 Nailor – Series 1000 with HL2 quadrant
- .3 Round duct work - low pressure butterfly damper:
  - .1 Galvanized steel frame 0.9 mm (22 ga) with stiffening beads up to 300 mm diameter; 0.9 mm (20 ga) over 300 mm duct size.
  - .2 Blade: Galvanized steel 0.9 mm (22 ga) up to 300 mm diameter; 0.9 mm (20 ga) over 300 mm duct size, 6 mm diameter drive shaft.
  - .3 Locking quadrant: Galvanized steel locking quadrant with “Open – Closed” labels, 50 mm insulation stand-off.
  - .4 Acceptable Manufacturers:
    - .1 Nailor – Series 1890 with HLQ-SB quadrant
- .4 Splitter damper:
  - .1 Material: Same material and thickness as ducts in which they are to be installed, minimum of 0.8 mm (22 ga).
  - .2 Form splitters of double thickness of metal and with rounded surface at air entering edge.
  - .3 Splitter length: At least one and one-half times width of smaller branch duct, but in no case less than 300 mm.
  - .4 Provide with locking type quadrant.
- .3 Volume Extractors in Duct Work:
  - .1 Use where noted on Drawings
  - .2 Acceptable Manufacturers
    - .1 Titus Model AG225 with #3 manual operator.

## 2.3 **FIRE AND SMOKE DAMPERS**

- .1 Fire Dampers
  - .1 ULC labelled fire dampers of hinged, fusible link type with channel frames, blades and housing and conforming to NFPA 90A and UL555 requirements. Use "Type B" fire dampers for rectangular or square duct work and "Type C" fire dampers for round duct work.
  - .2 Dynamic dampers: Designed to close while the system fans are operating.
  - .3 Static dampers: Designed to close with no airflow through damper.
  - .4 Closure link: Fusible link which can be released, tested and relatched for testing.
  - .5 Construct fire dampers and frames of same material as duct in which they are installed.
  - .6 Acceptable Manufacturers:
    - .1 Nailor – “D” series

- .2 Ruskin
  - .3 Ventex Alumavent
- .2 Smoke Dampers
  - .1 ULC labelled fire dampers of airfoil parallel blade type, with extruded aluminum channel frames and sleeve housing and conforming to NFPA 90A and 92A, and UL555S, leakage class I rating at 176°C (350°F).
  - .2 Blades: Extruded aluminum airfoil blade with concealed linkage outside of airstream, with self lubricating bronze type bearings, stainless steel camber style jamb seals, and mechanically locked in extruded edge seals
  - .3 Dampers designed to operate while the system fans are operating.
  - .4 Operator: Externally mounted, factory installed 120 VAC electric actuator with spring return, fail close position. Built-in high limit thermostat switch opens at 73°C (163°F).
  - .5 Accessories: 120 VAC proof-of-closure and proof-of-open end-switch, with two SPDT switches.
  - .6 Acceptable Manufacturers: Damper
    - .1 Nailor – Series 1280
    - .2 Ruskin
    - .3 Ventex Alumavent
  - .7 Acceptable Manufacturers: Operator
    - .1 Belimo – Model FSNF-120 US
- .3 Combination Smoke and Fire Dampers
  - .1 ULC labelled fire dampers of airfoil parallel blade type, with extruded aluminum channel frames and sleeve housing and conforming to NFPA 90A and 92A, and UL 555 and UL555S, leakage Class I rating at 176°C (350°F).
  - .2 Blades: Extruded aluminum airfoil blade with concealed linkage outside of airstream, with self lubricating bronze type bearings, stainless steel camber style jamb seals, and mechanically locked in extruded edge seals
  - .3 Dampers designed to operate while the system fans are operating.
  - .4 Operator: Externally mounted, factory installed 120 VAC electric actuator with spring return, fail close position. Built-in high limit thermostat switch opens at 73°C (163°F).
  - .5 Accessories: 120 VAC proof-of-closure and proof-of-open end-switch, with two SPDT switches.
  - .6 Acceptable Manufacturers: Damper
    - .1 Nailor – Series 1220
    - .2 Ruskin
  - .7 Acceptable Manufacturers: Operator

- .1 Belimo – Model FSNF-120 US

## 2.4 **ACOUSTIC TREATMENT**

### .1 Acoustic Duct Insulation

#### .1 Material:

- .1 Rigid coated duct liner conforming to NFPA 90A and 90B, 25 mm thick and 72 kg/m<sup>3</sup> density.
- .2 In duct work at velocities over 15 m/s, provide a perforated or expanded metal inner liner over acoustic insulation.

#### .2 Fasteners:

- .1 Fasten acoustic liner to inside of duct with plate type impaling pins and self-locking washers, by Eckels Industries "Stic-Klips", "Tactoo Series T", or Continental Stud Welding weld pins and self locking washers.
- .2 Use fasteners or securing pins of size and length as required by insulation weight, thickness, fastener spacing and design.
- .3 In addition to mechanical type fasteners, adhere insulation to inside of duct with Foster No. 81-99 or Henry No. 230-04 fire retardant adhesive. Seal all joints with Foster No. 30-36 or Henry No. 120-09 mastic sealant.

#### .3 Acceptable Manufacturers:

- .1 Owens Corning
- .2 Manson
- .3 Knauf
- .4 Manville

## 2.5 **ACOUSTIC SILENCERS (S)**

### .1 Rectangular and Elbow Silencers

#### .1 Material:

- .1 Housing: Hot dip galvanized steel sheet, one gauge heavier than adjacent duct work but not less than 0.9 mm (20 ga).
- .2 Duct size: External silencer dimension to match adjacent duct dimensions, unless otherwise shown.
- .3 Inner liner: Hot dip galvanized perforated steel sheet, 0.8 mm (22 ga).
- .4 Insulation: Glass fibre or mineral wool to ASTM E-84, class 1.

#### .2 Performance

- .1 Silencers have been selected on basis of sound power levels of first listed equipment. Ensure that equipment of any other named manufacturer proposed for use has sound power levels equal to or lower than first listed equipment.

- .2 Be responsible for reducing noise levels to below acceptable maximum without additional cost to Owner.
  - .2 Circular Silencers
    - .1 Same as for rectangular silencers and as follows:
      - .1 Internal bullet: Spun head and tapered tail, with airflow straightening vanes.
      - .2 Duct size: Duct flange connection same size as adjacent duct size.
  - .3 Acceptable Manufacturers
    - .1 Vibron
    - .2 Vibro-Acoustics
    - .3 Woods
- 3 Execution
  - 3.1 **GENERAL**
    - .1 Refer to and comply with applicable requirements specified in Section 23 05 01.
    - .2 Install miscellaneous steel framing, supports, braces, etc. as required to hang or support equipment and duct work as specified herein, and as shown on Drawings.
  - 3.2 **FLEXIBLE DUCT CONNECTIONS**
    - .1 Use flexible duct connections between fans and/or air handling units and connecting duct work, between unit components, in ducts at building expansion joints, and in other locations shown on Drawings
    - .2 Install flexible connectors with fabric in folds, not drawn tight.
    - .3 Install internal guides to prevent flexible connection from collapsing on suction side of fans.
    - .4 For installation between sections of air handling units, install flexible connectors suitable for connecting to flanges of casings where so provided.
  - 3.3 **TURNING VANES**
    - .1 Provide hollow airfoil type turning vanes in duct work where shown on Drawings and in ninety degree square duct elbows, fabricated of same material as duct in which they are installed.
  - 3.4 **ACCESS DOORS**
    - .1 Provide access doors in duct work and for plenums to allow servicing, maintenance, and inspection of:
      - .1 Control dampers
      - .2 Fire dampers
      - .3 Smoke dampers
      - .4 Fire detectors

- .5 Control elements
- .6 Sprinkler heads mounted in duct work
- .7 Motors
- .8 Bearings
- .9 As shown on Drawings
- .2 Provide "Hand Doors" in duct work of sizes as follows:

Access Type	Duct Dimension	Access Door Size
One hand and sight	Less than 400 mm	300x150 mm
Two hands and sight	Between 400 mm and 500 mm	450x250 mm
Head and shoulders	Between 500 mm and 760 mm	530x356 mm
Body plus ladder	Between 760 mm and 1320 mm	635x430 mm

- .3 Provide "Equipment and Man Doors" as follows:
  - .1 In duct work with duct dimension over 1320 mm.
  - .2 In plenums.
  - .3 As shown.

### 3.5 **BALANCING DAMPERS**

- .1 Use rectangular opposed blade dampers at the following locations:
  - .1 At floor connections to riser shafts/ducts.
  - .2 In supply and return duct work where main ducts are split into two more trunks.
  - .3 At rectangular branch duct connections to main or trunk ducts.
  - .4 As shown.
- .2 Use splitter dampers only where specifically shown on Drawings.
- .3 Use medium pressure butterfly dampers at the following locations:
  - .1 At floor connections to supply air riser ducts.
  - .2 In supply and return duct work where main ducts are split into two more trunks.
  - .3 At branch duct connections to main or trunk ducts.
  - .4 At branch duct upstream of terminal box.
  - .5 As shown.
- .4 Use low pressure butterfly dampers at the following locations:
  - .1 At branch connections on the downstream side of terminal boxes.
  - .2 At individual branch outlets serving grilles or diffusers.
- .5 Dampers supplied with diffusers or grilles are to be used to balance  $\pm 10\%$  of indicated airflow, are NOT in lieu of branch dampers.

**3.6 VOLUME EXTRACTORS IN DUCT WORK**

- .1 Use where noted on Drawings.

**3.7 FIRE AND SMOKE DAMPERS**

- .1 Install fire dampers in accordance with Suppliers instructions, and with retaining angles on both sides of wall or floor and fastened to damper collars.
- .2 Install fire dampers with adjacent access door as required to permit re-opening of damper and replacement of fusible link.
- .3 Provide dynamic fire dampers on all systems, unless otherwise shown on Drawings and specified below.
- .4 Provide static dampers on return air transfer openings.

**3.8 PROBE INLETS**

- .1 Install probe inlets in duct work at locations as follows:
  - .1 In main supply and return ducts.
  - .2 Inlet and outlet side of fans.
  - .3 Other locations as required by testing and balancing trade, to permit testing, balancing and measurement of air quantities and static pressure in air handling systems.
- .2 Locate probe inlets a sufficient distance from elbows or transition sections to ensure stable readings of non-turbulent air and install 75 mm from corners and at 150 mm centres across long side of duct.

**3.9 ACOUSTIC DUCT INSULATION AND SILENCERS**

- .1 Install internal acoustic insulation in specific sections of duct work and/or plenums as shown on Drawings as follows:
  - .1 Adhere insulation to duct work or plenums by bedding in strips of adhesive supplemented by impaling clips or weld pins spaced at 300 mm centres with self-locking washers.
  - .2 Apply adhesive at 50% coverage, in 150 mm strips.
  - .3 Cut off ends of welded impaling pins after application of self-locking washers.
  - .4 Seal butt joints of insulation with mastic sealant applied to edges of insulation.
  - .5 Coat joints and self-locking washers after installation with two coat application of mastic sealant, and with open mesh glass fabric embedded in mastic between first and second coat.
  - .6 In high velocity duct work install perforated or expanded metal inner liner over acoustic lining.
- .2 Use silencers in duct work where shown on Drawings, to attenuate airborne noise generated in air distribution systems.
- .3 Fabricate cross talk silencers:
  - .1 Housing: Galvanized steel, to SMACNA pressure class 1" standard.

- .2 Liner: Rigid coated duct liner.
- .3 Size: As shown on drawings.
- .4 Shape: As shown on drawings.
- .5 Provide a sheetmetal nosing at open ends of duct to close off cut edge of liner.

End of Section

- 1 General
  - 1.1 **SUMMARY**
    - .1 Section Includes
      - .1 Labour, Products, equipment and services necessary to complete the Work of this section.
  - 1.2 **REFERENCE STANDARDS**
    - .1 Comply with the latest edition of the standards referenced herein:
      - .1 Fans: Designed and constructed in strict conformity with the AMCA Standards and bearing the "Certified Rating Seal".
      - .2 Applicable sections of CSA C22.2 No. 113 for fan construction and installation.
      - .3 Occupational Health and Safety Act, O.Reg 851.
  - 1.3 **SUBMITTALS**
    - .1 Shop Drawings
      - .1 Submit Shop Drawings in accordance with Section 01 33 00.
      - .2 Submit manufacturer's certified Shop Drawings to the Consultant and include:
        - .1 Complete information on fan construction and performance.
        - .2 Performance curves over full range from shut-off to free delivery.
        - .3 Drive details.
        - .4 Make, type and catalogue number of bearings.
        - .5 State hour rating of bearings when specified.
    - .2 Operation and Maintenance Data
      - .1 Submit printed operating instructions and maintenance data in accordance with Section 01 33 00.
    - .3 Maintenance Materials
      - .1 Provide and turn-over to Owner at time of Substantial Completion one V-belt set for each size used.
        - .1 Where more than one fan uses the same set size, provide only one set.
- 2 Products
  - 2.1 **GENERAL REQUIREMENTS**
    - .1 Performance Ratings
      - .1 Type, size and capacity shown on Drawings for each specific application and conforming to requirements of manufacture, operation and performance as specified.
      - .2 Select fan size, operating rpm and rating point on stable head flow curve with smooth characteristics.

- .3 Operating at least 20% below first critical speed when operating at maximum speed for class of construction.
- .4 Dynamically and statically balance wheels of free standing or unitary fans to acceptable tolerances relative to size and speed.
- .2 Cleaning and Metal Protection
  - .1 Thoroughly clean interior and exterior surfaces of fans including screens, at factory with approved de-greasing agent to CGBS 1-GP-181M+ Amdt-Mar-78.
  - .2 Apply a coating of red oxide or zinc chromate primer unless special protective coating is specified.
    - .1 Exception: Fans constructed of galvanized steel or aluminum.
- .3 Materials
  - .1 Fan casings: Heavy gauge steel or spun aluminum construction, as specified by model number.
    - .1 Explosion proof construction (non-sparking) where listed in schedules.
- .4 Bearings
  - .1 Service life
    - .1 To L10 life standard in accordance with latest AFBMA code.
    - .2 Unitary, axial and free standing fans: 200,000 (60,000) (80,000) (100,000) hour service.
    - .3 Other fan bearings: 8,000 hour service.
  - .2 Type
    - .1 Grease lubricated ball or roller type fan bearings with ample thrust provision to prevent end play during normal life of bearings.
    - .2 Smaller than 36 mm diameter: Cartridge type.
    - .3 36 mm diameter and larger: Shaft adapter sleeve type bearings utilizing horizontally split pillow blocks and mechanical flinger type grease valves.
    - .4 Shafts smaller than 56 mm diameter, interference fit bearings may be used in lieu of adapter sleeve type.
  - .3 Bearings in air stream
    - .1 Well secured extended grease lubricating lines unless bearing is easily accessible through man-size access door.
    - .2 Pack bearings with low temperature grease in factory.
  - .4 Axial flow fans
    - .1 Conform to these Specifications except where inner cylinder mounting methods are used or dimensions do not permit it and special or flange mounted type bearings are required.
  - .5 Grease fittings, for fans driven by motors 0.375 kW (1/2 HP) and larger

- .1 Provide bearings with Zerk or Alemite grease fittings, with provision for automatic relief of lubricant pressure to outside of fan, away from wheel and visible from maintenance location.
    - .2 Use service fittings and relief fittings easily accessible from maintenance locations and at separate and opposite sides of bearing housing.
  - .5 Motors and Drives
    - .1 Motor ratings
      - .1 To Section 23 05 13.
      - .2 Type, kW (HP) rating, motor speed and electrical characteristics shown on Drawings.
      - .3 Capable of satisfactory operation over range of performance from shut-off to run-out at 110% of rated rpm at point of selection.
    - .2 Drive and belt guards: To Section 23 05 01.
- .6 Accessories
  - .1 Fans with variable inlet vanes
    - .1 Operating mechanisms to provide simultaneous adjustment of vanes.
    - .2 Motor operated mechanisms to be suitable for adaptation of motor operator provided under Division 25.
    - .3 Quick opening access doors in scroll casing.
    - .4 On DWDI fans interconnect vanes in each inlet to operate in unison.
    - .5 Provide locking device for manual operation.
  - .2 Casing drains
    - .1 Fans discharging vertically through roof: Fitted with 38 mm casing drains.
  - .3 Roof mounted fans
    - .1 Factory mounted unfused disconnect switches wired to motor terminals.
    - .2 Conduit or wiring post running through fan housing so that wiring may be run to line side of disconnect switch from below roof without disturbing roof construction.
  - .4 Roof curbs for roof mounted fans and ventilators
    - .1 Prefabricated insulated galvanized steel sheet curbs for mounting to roof deck.
    - .2 Prefabricated insulated galvanized steel sheet curbs for mounting to roof deck.
    - .3 Minimum curb height: 300 mm on every side, or as dimensioned on Drawings.

## 2.2 FAN TYPES

.1 Centrifugal Fans

.1 Arrangements

Fan Type	Arrangement
Belt driven single inlet single width (SWSI) fans up to and including 915 mm wheel diameter	#1 or #2
Belt driven single inlet single width (SWSI) fans with wheel diameter larger than 915 mm diameter	#3
Belt driven double width double inlet (DWDI) fans	#3
Belt drive plenum (plug) fans, single width single inlet (SWSI) fans	#3
Direct connected double width double inlet (DWDI) fans	#7
Direct connected single inlet single width (SWSI) fans	#8
Utility sets	#10
Tubular single width single inlet (SWSI) fans	#1 or #9

.2 Fan wheels

- .1 Backward curved or backward inclined for fan wheels less than 686 mm diameter.
- .2 Single or double thickness backward curved air foil blades for fan wheels 686 mm diameter and larger.

.3 Fan casing

- .1 Continuous seam welded.
- .2 Inlet mounting collar.
- .3 Outlet flanged collar.

.4 Plenum (plug) fans

- .1 Safety screen enclosure around fan and motor fabricated from steel angle and expanded metal mesh.
- .2 Access covers to fan and motor shaft ends for speed measurements.

.5 In-line cabinet fans

- .1 Single wheel SWSI centrifugal fans with motor and V-belt drive.
- .2 Removable panels for access to internal parts.
- .3 Internally lined cabinet with 50 mm thick rigid acoustic insulation.
- .4 Expanded metal mesh over insulation on floor.
- .5 Motor pre-wired to external junction box.
- .6 Mounting ring or brackets for vertical or horizontal suspension from overhead structure.
- .7 Belt guard, motor and drive.
- .8 Hanger brackets.
- .9 Inlet and outlet cones.
- .10 Quick-opening access door.

- .11 External grease and relief fittings to each bearing.
    - .12 Variable inlet vanes and linkage where noted.
  - .6 Ceiling cabinet fan / in-line cabinet fan
    - .1 Fan wheel
      - .1 Centrifugal direct drive type.
      - .2 High strength polymer material.
      - .3 Forward curved.
    - .2 Motor
      - .1 Continuous duty, permanently lubricated, thermally protected.
      - .2 Resilient motor mounts to eliminate vibration.
    - .3 Casing
      - .1 Heavy gauge steel.
      - .2 Acoustic lining.
      - .3 Painted for corrosion resistance.
      - .4 Built-in backdraft damper.
      - .5 Outlet connection for round duct.
      - .6 Integral mounting flanges to allow for ceiling installation.
  - .7 Tubular centrifugal fans
    - .1 Characteristics and construction as for centrifugal fan wheels.
    - .2 (Direct drive motor) (Belt drive assembly).
    - .3 Smooth rounded inlet, and stationary guide vanes.
- .2 Tube and Vane Axial Fans
  - .1 Fan
    - .1 Fabricated of welded steel with welded motor support.
    - .2 Quick-opening access door.
    - .3 External grease and relief fittings to each bearing.
    - .4 Streamlined inlet cone and discharge bell sections.
    - .5 Integral silencer casing.
    - .6 Reinforced legs for floor mounted units.
    - .7 Hanger brackets.
    - .8 Support bracket welded to side of casing for suspended units.
  - .2 Drives

- .1 Direct driven: (Adjustable pitch) (Fixed pitch) (Fan blade with totally enclosed "air-over" motors and diameter of wheel hub at least equal to that of motor frame.
- .2 Belt driven: (Fixed) (Adjustable) blade wheels with externally mounted open drip proof motors, internal belt fairing, external belt guards and adjustable motor mounts.
- .3 Roof Top Fans and Ventilators
  - .1 Upblast exhaust and downward supply air fans
    - .1 Suitable for mounting on curbed roof openings.
    - .2 Heavy gauge galvanized steel housing and windband.
    - .3 Finished inside and outside with sprayed asphalt.
    - .4 Heavy gauge curb cap.
    - .5 Gravity or spring assisted steel dampers as required, with magnetic catches to dampers to prevent rattling in closed position.
    - .6 TEAO motor.
    - .7 Weatherproof protective motor cover and belt-drive.
    - .8 Supply fans complete with 25 mm throwaway filters.
  - .2 Spun aluminum dome type fans
    - .1 Belt or direct driven as indicated in schedules.
    - .2 Spun aluminum housing.
    - .3 Hinged or completely removable hood for access to motor and fan.
    - .4 Non-overloading centrifugal fan wheel.
    - .5 Multi-blade gravity backdraft damper and aluminum 13 mm mesh birdscreen.
  - .3 Gravity relief vents
    - .1 Spun aluminum cover.
    - .2 Welded aluminum curb cap.
    - .3 Galvanized bird screen.
    - .4 Exhaust air outlets complete with backdraft dampers.
  - .4 Penthouse type intake and exhaust hoods
    - .1 Extruded aluminum fixed louvres with birdscreens on inside.
    - .2 Insulated metal roof.
    - .3 Welded base to suit curbed opening and prefinished to later colour selection.
- .4 Ceiling Fans

- .1 Multi-bladed propellers of sheet or airfoil shape.
- .2 Permanently lubricated ball bearings suited for operation in any position.
- .3 Direct driven, variable speed, with EC motor complete with controllers.
- .4 Acceptable manufacturers:
  - .1 Big Ass Fans
  - .2 Altra Air (Envira North)
  - .3 MacroAir
- .5 Propeller Fans
  - .1 Wall type belt or direct driven propeller fans
    - .1 Multi-bladed propellers of sheet or airfoil shape steel within bell mouth entrance.
    - .2 Grease lubricated ball bearings suited for operation in any position.
    - .3 (Direct) (or) (belt) driven, with motor as indicated.
    - .4 Bird screen (and automatic backdraft dampers with gasketted edges).
    - .5 Wire guard on motor side.
    - .6 Support motor with substantial brackets or frame. Motors supported integrally with wire guard will not be accepted.
- .6 Acceptable Manufacturers
  - .1 Industrial Type Construction (In-line, Propeller Utility Sets, Upblast, Fume)
    - .1 Twin City Fan
    - .2 Chicago Blower
    - .3 New York Blower
    - .4 Northern Blower
    - .5 Barry Blower
    - .6 Carnes
    - .7 Aeroflow
    - .8 Aerovent
    - .9 Howden Fan Co.
    - .10 American Fan Company (Flakt Woods)
    - .11 Wood Fans
    - .12 Canada Blower
  - .2 Ceiling Cabinet Fans
    - .1 Greenheck

- .2 Twin City
    - .3 Carnes
    - .4 Aerovent
    - .5 PennBarry
    - .6 Loren Cook
  - .3 Small Propeller Fans
    - .1 Howden Fan Co.
    - .2 Greenheck
    - .3 Carnes
    - .4 American Fan Company (Flakt Woods)
    - .5 Wood Fans
  - .4 Spun Aluminum Fans
    - .1 Greenheck
    - .2 Jenn Air
    - .3 Carnes
    - .4 American Fan Company (Flakt Woods)
  - .5 Intake and Exhaust Hoods, Penthouses, Relief Vents
    - .1 Greenheck
    - .2 Jenn Air
    - .3 Carnes
    - .4 Loren-Cook
    - .5 American Fan Company (Flakt Woods)
- 3 Execution
- 3.1 **GENERAL**
  - .1 Fan Installation
    - .1 Install fans complete with resilient mountings and restraining snubbers in accordance with Section 23 05 48.
    - .2 Provide flexible connections on inlet and outlet ductwork in accordance with Section 23 33 00.
    - .3 Align shafts, belt drive and motor, adjust belt tension and check motor rotation before start-up.
    - .4 Protect motors and fans during construction and rotate fans, by hand, every month between delivery and acceptance of building.

.2 Air Balancing

- .1 Adjust variable pitch fan/motor sheaves during balancing to achieve specified air quantities.
- .2 Provide sheaves and belts for final air balance.

3.2 **FABRICATED GOOSENECK TYPE FRESH AIR INTAKE AND EXHAUST AIR HOODS**

- .1 Fabrication: Black steel construction.
- .2 Size, shape and arrangement as shown on Drawings.
- .3 Finish interior and exterior surfaces finished with rust inhibitive primer.

End of Section

(THIS PAGE INTENTIONALLY LEFT BLANK)

- 1 General
  - 1.1 **SUMMARY**
    - .1 Section Includes
      - .1 Labour, Products, equipment and services necessary to complete the Work of this section.
  - 1.2 **REFERENCE STANDARDS**
    - .1 Comply with the latest edition of the following:
      - .1 Insulation systems
        - .1 UL 181 (Air Erosion)
        - .2 UL 181 (Mold Growth and Humidity)
        - .3 UL 723 (25/50) (Flame and Smoke)
        - .4 ASTM E 84 (25/50) (Flame and Smoke)
        - .5 ASTM C665 (Fungi Resistance)
  - 1.3 **SUBMITTALS**
    - .1 Shop Drawings
      - .1 Submit Shop Drawings in accordance with Section 01 33 00 and provide the following:
        - .1 Airflow and sound power data
        - .2 Motor load data
        - .3 Control systems
    - .2 Operation and Maintenance Data
      - .1 Submit printed operating instructions and maintenance data in accordance with Section 01 33 00.
  - 1.4 **CODES AND REGULATIONS, PERMITS, COSTS AND FEES**
    - .1 Comply with municipal or provincial codes, rules and regulations and/or authorities having jurisdiction.
      - .1 Electrical certification
        - .1 CSA labeled or field approval
- 2 Products
  - 2.1 **LOW PRESSURE TERMINAL UNITS - TO 750 PA (3" WG)**
    - .1 General
      - .1 Type, model and size as shown on Drawings
      - .2 Acceptable Manufacturers:

- .1 E.H. Price
- .2 Titus
- .3 Trane
- .4 Kreuger Division of Phillips Air Distribution Ltd.
- .5 Nailor Industries Inc.
- .6 Carnes
- .7 Tuttle & Bailey
- .3 Operating pressure
  - .1 Maximum inlet air pressure: 750 Pa (3" wg).
  - .2 Minimum inlet air pressure: 75 Pa (0.3" wg).
  - .3 Maximum pressure drop across unit including attenuator, at 10 m/s inlet velocity: 40 Pa (0.15" w.g.)
  - .4 Air leakage, close damper position: maximum 2% of nominal catalogue rating at an air inlet pressure of 750 Pa (3" w.g.)
- .4 Acoustic ratings
  - .1 Maximum room NC sound pressure level ( $2 \times 10^{-4}$  microbar reference) at maximum inlet pressure: Less than forty at discharge and forty-two radiated for box with attenuator mounted exposed (without ceiling).
- .5 Performance ratings
  - .1 ARI 880 certified.
  - .2 Maintain air quantity within  $\pm 5\%$  of set value, between zero and specified rating, and sound level below specified values when operating from minimum to maximum inlet static pressure as given above.
- .6 Materials
  - .1 Stainless steel: 20 gauge type 316L stainless steel.
  - .2 Fibreglass insulation: 20 mm thick (unless otherwise specified), dual density fibreglass. Exposed/cut edges sealed with NFPA-90A approved sealant, or metal caps as specified.
- .2 Single Duct Terminal Units (TU)
  - .1 Variable volume or constant volume as per equipment schedules
  - .2 Casing construction
    - .1 Casing: 22 gauge galvanized steel.
    - .2 Insulation Type 1: Fiberglass encapsulated in woven fabric liner, and wrapped edges.
    - .3 Insulation Type 2: Fiberglass with aluminum foil liner and sealed edges.

- .4 Insulation Type 3: Fiberglass encapsulated in woven fabric liner, and galvanized steel perforated liner, and metal cap edges.
- .5 Insulation Type 4: Fiberglass with galvanized steel solid liner, and metal edge caps.
- .6 Insulation Type 5: Fiberglass with galvanized steel perforated liner, with metal edge caps.
- .3 Control elements
  - .1 Pressure independent type.
  - .2 Velocity sensor, cross tree type, with an accuracy within 5% with a ninety degree elbow connected at the inlet to the assembly.
  - .3 Damper: Heavy gauge metal, with edge gasket, self-lubricating bearings, and adjustable minimum stop.
  - .4 Damper arranged "normally open" for morning warm-up.
  - .5 Controls and damper actuator as specified below.
- .4 Discharge section
  - .1 Open end or multiple outlet attenuator on box discharge acoustically treated with insulation as described above for the unit casing.
  - .2 Reheat coils where scheduled, complete with access door in bottom of attenuator on inlet side of coil.
- .3 Fan Powered Variable Air Volume Terminal Units (TUF)
  - .1 Type
    - .1 Variable volume primary air flow and constant volume supply air through fan operation.
  - .2 Casing construction
    - .1 Casing: 22 gauge galvanized steel up to 900 mm wide; 20 gauge minimum galvanized steel over 900 mm wide.
    - .2 Internal sound reduction baffle.
    - .3 Bottom access door with cam-lock fittings, for fan removal.
    - .4 Insulation Type 1: Fiberglass encapsulated in woven fabric liner, and wrapped edges.
    - .5 Insulation Type 2: Fiberglass with aluminum foil liner, galvanized steel perforated liner and metal cap edges.
    - .6 Insulation Type 3: Fiberglass encapsulated in woven fabric liner, and galvanized steel perforated liner, and metal cap edges.
    - .7 Insulation Type 4: Fiberglass with galvanized steel solid liner, and metal edge caps.
    - .8 Insulation Type 5: Fiberglass with galvanized steel perforated liner, with metal edge caps.

- .3 Control elements
  - .1 Pressure independent type primary air regulator.
  - .2 Velocity sensor, cross tree type, with an accuracy within 5% with a ninety degree elbow connected at the inlet to the assembly.
  - .3 Damper: Heavy gauge metal, with edge gasket, and self-lubricating bearings and adjustable minimum stop.
  - .4 Single point electrical and control connection, in a single control box with access panel, sealed from the primary air section.
  - .5 Controls and damper actuator as specified below.
- .4 Fan and motor assembly
  - .1 Forward curved, direct drive, statically and dynamically balanced centrifugal fan suspended on rubber in shear isolators.
  - .2 Electrically commutated motor, brushless DC design, with built-in inverter and microprocessor based motor controller, to maintain supply air volume independent of system static pressure, permanently lubricated ball bearings.
  - .3 Field manual adjustment of fan speed.
  - .4 4-20 mA or 0-10 VDC input for remote BMS fan speed reset.
  - .5 115 V, 1 phase, 60 Hz.
- .5 Discharge section
  - .1 Open end or multiple outlet attenuator on box discharge acoustically treated with rigid acoustic insulation held in place with adhesive and pins.
  - .2 Open end secondary air inlet silencer acoustically treated with rigid acoustic insulation held in place with adhesive and pins.
  - .3 Reheat coils where scheduled, complete with access door in bottom of attenuator on inlet side of coil.
- .6 Performance
  - .1 Maintain primary air quantity within  $\pm 5\%$  of set value, between zero and specified rating.
  - .2 Radiated and discharge sound levels below values specified above when operating with maximum primary air, an inlet static pressure of 375 Pa (1.5" wg) and fan running on medium speed.
- .4 Fan Powered Variable Air Volume Terminal Units - Low Noise, High Capacity (TUFQ)
  - .1 Type
    - .1 Variable volume primary air flow and constant volume supply air through fan operation.
  - .2 Acoustic performance

- .1 Not to exceed the following radiated sound power levels at 250 Pa (1" w.c.) inlet pressure, and 60 Pa (0.25" w.c.) discharge pressure.

Airflow L/s	Sound Power Levels					
	2	3	4	5	6	7
425	62	56	46	39	37	36
570	64	59	47	42	40	39
750	68	62	51	45	43	42
940	68	63	53	48	44	43

.3 Casing Construction

- .1 Casing: 20 gauge galvanized steel.
- .2 Internal sound reduction baffle.
- .3 Bottom access door with cam-lock fittings, for fan removal.
- .4 Insulation Type 1: 50 mm thick fibreglass encapsulated in woven fabric liner, and wrapped edges.
- .5 Insulation Type 2: Fiberglass with aluminum foil liner, galvanized steel perforated liner and metal cap edges.
- .6 Insulation Type 3: Fiberglass encapsulated in woven fabric liner, and galvanized steel perforated liner, and metal cap edges.
- .7 Insulation Type 4: Fiberglass with galvanized steel solid liner, and metal edge caps.
- .8 Insulation Type 5: Fiberglass with galvanized steel perforated liner, with metal edge caps.

.4 Control elements

- .1 Pressure independent type primary air regulator.
- .2 Velocity sensor, cross tree type, with an accuracy within 5% with a ninety degree elbow connected at the inlet to the assembly.
- .3 Damper: Heavy gauge metal, with edge gasket, and self-lubricating bearings and adjustable minimum stop.
- .4 Controls and damper actuator as specified below.

.5 Fan and motor assembly

- .1 Forward curved, direct drive, statically and dynamically balanced centrifugal fan suspended on rubber in shear isolators.
- .2 Electrically commutated motor, brushless DC design, with built-in inverter and microprocessor based motor controller, to maintain supply air volume independent of system static pressure, permanently lubricated ball bearings.
- .3 Field manual adjustment of fan speed.
- .4 4-20 mA or 0-10 VDC input for remote BMS fan speed reset.

- .5 115 V, 1 phase, 60 Hz.
- .6 Discharge section
  - .1 Open end or multiple outlet attenuator on box discharge acoustically treated with rigid acoustic insulation held in place with adhesive and pins.
  - .2 Open end secondary air inlet silencer acoustically treated with rigid acoustic insulation held in place with adhesive and pins.
  - .3 Reheat coils where scheduled, complete with access door in bottom of attenuator on inlet side of coil.
- .7 Return air section
  - .1 Acoustic return air section, to same construction as casing construction.
- .8 Performance
  - .1 Maintain primary air quantity within  $\pm 5\%$  of set value, between zero and specified rating.
- .5 Reheat Coils
  - .1 Heating capacities: As shown in schedules
  - .2 Coil conditions:
    - .1 Entering air temperature: 18°C (65°F).
  - .3 Hot water coil construction
    - .1 Factory mounted.
    - .2 Serpentine, copper tube mechanically expanded into aluminum fins.
    - .3 Hydraulically pressure tested to 1550 kPa (225 psig).
    - .4 Galvanized steel coil casing.
    - .5 S-cleat flanges.
    - .6 Reheat coil positioned at downstream end of attenuator section.
  - .4 Electric reheat coils
    - .1 Factory mounted.
    - .2 CSA certified.
    - .3 Heater frame and cabinet: heavy gauge galvanized steel.
    - .4 Heating elements: 80/20 nickel-chromium wire, low density to limit hot spots and cycling of thermal protectors.
    - .5 Element insulation: Floating ceramic bushings.
    - .6 Primary protection: Automatic reset thermal cut-out.
    - .7 Secondary protection: Manual reset cut-out.

- .8 Capacity control: Proportional pulsed output control using 4-20 mA, 0-10 VDC or pulsed input from thermostat or BMS system.
- .9 Modulating control: Solid state switching with zero cross-over.
- .10 Electronic air flow sensor to limit heater output dependant on volume of air supply.

.6 Controls

.1 Direct Digital Control (DDC)

- .1 Provided by the terminal unit manufacturer.
- .2 Dedicated microprocessor based controller, with integral damper actuator.
- .3 Electronic flow transducer.
- .4 Standalone operation, capable of interfacing with a Building Management System, and hand-held portable operator interface device.
- .5 Actuator: 24 VDC bi-directional, direct coupled to the damper shaft.
- .6 Factory wired, calibrated and pre-tested, for maximum and minimum air flows.
- .7 Zone temperature sensor: Temperature setpoint adjustment, and access for connection of a hand-held operator terminal.

.7 Single Point Power Supply

- .1 Provide single point power wiring for terminal units, at highest voltage and phases as shown on equipment schedules.
- .2 Main control panel with power distribution:
  - .1 Fused primary/24 VAC secondary transformers for controls power, with internal disconnect switch.
  - .2 Fused primary/120 VAC secondary transformers for fan power, for fan powered terminal units, with internal disconnect switch.
  - .3 Fused disconnect switch for electric reheat coil.
  - .4 Clear Lexan plastic cover over live terminals on line-side of main disconnect switch.
  - .5 Note: electric heating coil control panel may be used as the main control panel.
- .3 Provide power wiring to fan motor and DDC control unit.

3 Execution

3.1 **INSTALLATION**

.1 General

- .1 Install air terminal units with at least four duct diameters of straight duct upstream of inlet.

- .2 Support terminal boxes from building structure with angles, hangers and supplementary steel before installation of piping and connecting ductwork.
- .3 Connect supply and return piping to reheat coils with swing joints to allow for pipe expansion and contraction.
- .4 Install isolating valve on supply and lock shield globe valve and automatic control valve on return of each reheat coil.
- .5 Provide manual air vent with isolating cock at high point of piping to each coil.
- .2 Electric and DDC Controls
  - .1 Provide 120 VAC and 24 VDC wiring, as required, from junction box provided under Division 26, near each terminal unit, and wire to terminal box fan and controls.
- .3 Testing and Adjustment
  - .1 Adjust fan speed on fan powered terminal boxes to obtain final flow volumes, to minimize use of balancing dampers on downstream ductwork and diffusers.

End of Section

- 1 General
- 1.1 **SUMMARY**
  - .1 Section Includes
    - .1 Labour, Products, equipment and services necessary to complete the Work of this section.
- 2 Products
- 2.1 **DIFFUSERS, REGISTERS AND GRILLES**
  - .1 General
    - .1 Neck size, dimensions and capacity as shown on Drawings. Catalogue numbers of first named Supplier are listed on Drawings to show required type and style.
    - .2 Acoustic and airflow performance is based on catalogued information of the indicated manufacturer and model as shown on Drawings or schedules. Other named manufacturer Products must match these implied performance criteria.
    - .3 Border and frame as required to suit wall and ceiling construction.
  - .2 Linear Diffusers and Grilles
    - .1 Extruded aluminum construction, unless otherwise shown on Drawings.
    - .2 Linear supply and return diffusers to have either natural anodized aluminum finish or baked enamel finish as listed on Drawings.
    - .3 Complete with engineered distribution plenum and internal opposed blade damper. Black finish on inside of plenums.
    - .4 Curved and custom shapes and finishes as detailed on Drawings.
  - .3 Square and Circular Pattern Diffusers
    - .1 Steel construction with baked white enamel finish, unless otherwise shown.
    - .2 True imperial or metric sizes.
    - .3 Radial opposed blade damper.
  - .4 Grilles
    - .1 Steel construction with baked white enamel finish, unless otherwise shown.
    - .2 Blade orientation parallel to the long dimension.
    - .3 Opposed blade damper in black finish.
  - .5 Door Grilles
    - .1 Door grilles will be supplied and installed by general trades.
  - .6 Acceptable Manufacturers:
    - .1 E.H. Price
    - .2 Nailor Industries Inc.

- .3 Titus
- .4 Carnes
- .5 Tuttle & Bailey

3 Execution

3.1 **GENERAL**

- .1 Supply diffusers and registers to deliver indicated air quantities shown with throw to reach intended space limits without increasing the sound level of room. Provide blank-off baffles where required and equalizing deflectors on diffusers and in other locations as shown or required.
- .2 Coordinate placing of diffusers, registers and grilles in ceilings with electrical and ceiling installation trades and exact location to final approval of Consultant.
- .3 For connection to specific light-air troffers in flat ceilings provide boots to connect flexible duct to lighting fixtures.
- .4 For connection of air supply to coffered ceilings provide boots suitable for attachment to air slot on coffered ceilings as required and where shown on Drawings. Connect flexible supply air duct to neck of boot.

End of Section

  - .1 Section Includes
    - .1 Labour, Products, equipment and services necessary to complete the Work of this section.
- 1.2 **SUBMITTALS**
  - .1 Shop Drawings
    - .1 Submit Shop Drawings in accordance with Section 01 33 00.
- 2 Products
- 2.1 **ELECTRIC COOL/GAS HEAT ROOFTOP UNITS (1.5 TO 5 TONS)**
  - .1 General
    - .1 Roof mounted self-contained constant volume unit with DX refrigeration and gas burner. Unit shall bear CSA, CGA, and ULC labels.
    - .2 Completely factory assembled, piped, wired, tested and shipped to site in one piece. Units specifically designed for outdoor application.
    - .3 Ship units fully charged with refrigerant R410A.
  - .2 Construction
    - .1 Casing:
      - .1 Minimum 1 mm (20 gauge), zinc coated steel panels with backed enamel finish.
      - .2 Easily removable panels.
      - .3 Internally insulated cooling section panels with minimum 13 mm thick aluminum foil faced cleanable insulation.
      - .4 Unit casing with a sloped condensate pan.
    - .2 Fans:
      - .1 Double inlet type, forward curved, centrifugal type direct drive evaporator fan.
      - .2 Evaporator fan with steel construction and corrosion resistant finish.
      - .3 Propeller type, direct drive, aluminum blades condenser fan.
      - .4 Statically and dynamically balanced.
    - .3 Refrigeration system:
      - .1 Fully hermetic compressor with factory installed vibration isolation.
      - .2 Compressor safety controls including internal high pressure and overcurrent protection, short cycle protection, crankcase heater, and high/low pressure switches.

- .3 Evaporator and condenser coils with aluminum plate fins mechanically bonded to seamless copper tubes.
- .4 All interconnecting piping and accessories.
- .4 Motors:
  - .1 Totally enclosed condenser fan motor.
  - .2 Refrigerant cooled compressor motor complete with line break thermal and overcurrent protection.
  - .3 Permanently lubricated evaporator motor with bearing and automatic reset thermal overload protection.
- .5 Heating section:
  - .1 20 gauge, aluminized steel single stage heat exchanger.
  - .2 Direct spark ignition system.
  - .3 Aluminum coated steel burners.
  - .4 Induced draft combustion blower.
  - .5 All integrated controls.
  - .6 Provide gas pressure regulators in gas train to suit existing gas distribution pressure.
- .6 Accessories:
  - .1 Factory mounted condenser coil guard.
  - .2 Single stage heat/cool thermostat with "Auto-On" fan and "Heat-Auto-Cool" system switching functions.
  - .3 Electronic seven-day programmable thermostat with setback and setup provisions.
  - .4 Prefabricated roof curb.
  - .5 Economizer with controls and relief damper.
  - .6 Manual outside air damper.
  - .7 25 mm thick fiberglass throwaway filters.
  - .8 Weatherproof factory-installed, externally accessible, 115 volt convenience outlet with independent fuse protection.
- .7 Acceptable Manufacturers
  - .1 Johnson Controls
  - .2 Carrier
  - .3 Trane
  - .4 McQuay
  - .5 Lennox

## 2.2 **ELECTRIC COOL/GAS HEAT ROOFTOP UNITS (7.5 TO 20 TONS)**

### .1 General

- .1 Roof mounted self-contained constant volume unit with complete DX refrigeration system and gas burner.
  - .1 CSA, CGA, and ULC labels.
  - .2 Rated in accordance with ARI standards.
  - .3 Insulation and adhesives: To NFPA 90A requirements.
- .2 Factory assembled, piped, wired, tested and shipped to site in one piece. Units specifically designed for outdoor application.
- .3 Ship units fully charged with refrigerant R410A.

### .2 Construction

- .1 Casing:
  - .1 Minimum 1 mm (20 gauge), galvanized steel panels with backed enamel finish.
  - .2 Easily removable panels with gaskets.
  - .3 Internally insulated cooling section panels with minimum 13 mm thick, high density, neoprene coated, flexible fiberglass insulation.
  - .4 Internally insulated heating section compartment with high density, aluminum foil faced fiberglass insulation.
  - .5 Insulation to be permanently fastened to the cabinet interior.
  - .6 Heavy gauge, full perimeter base rail.
  - .7 Fully insulated sloped condensate pan.
- .2 Evaporator fan:
  - .1 Steel, double inlet wheel with corrosion resistant finish.
  - .2 Belt driven, forward curved with adjustable-pitch motor pulley and adjustable base.
  - .3 Sealed and permanently lubricated bearings.
  - .4 Statically and dynamically balanced.
- .3 Condenser fans:
  - .1 Aluminum blade, propeller type.
  - .2 Direct drive with totally enclosed, permanently lubricated ball bearings.
  - .3 Vertical or horizontal discharge.
  - .4 Statically and dynamically balanced.
- .4 Refrigeration system:

- .1 Two compressors with two independent refrigeration circuits and factory installed vibration isolation.
- .2 Sequenced unloading and hot gas bypass system for each compressor.
- .3 Compressor safety controls including internal high temperature and over current protection, short cycle protection, crankcase heater, and independent high/low pressure switches for each circuit.
- .4 Evaporator and condenser coils with aluminum plate fins mechanically bonded to seamless copper tubes.
- .5 All interconnecting piping and accessories.
- .5 Motors:
  - .1 Totally enclosed condenser fan motors with thermal overload protection.
  - .2 Refrigerant cooled compressor motor complete with line break thermal and over current protection.
  - .3 Permanently lubricated evaporator motor with bearing and automatic reset thermal overload protection.
- .6 Heating section:
  - .1 Indirect fired two-stage heating system.
  - .2 Twenty gauge, aluminized steel heat exchanger.
  - .3 Direct spark ignition system.
  - .4 Aluminum coated steel burners.
  - .5 Gas valve with internal pressure regulator.
  - .6 Induced draft combustion blower.
  - .7 High temperature limit switch.
  - .8 Flame proving control.
  - .9 Anti-cycle protection.
  - .10 Ventor motor speed sensor and flame rollout switch.
  - .11 Gas pressure regulators in gas train to suit existing gas distribution pressure.
- .7 Roof curb:
  - .1 350 mm high curb constructed of galvanized steel and wood nailer.
  - .2 Duct support members and continuous gasket for weatherproof installation.
- .8 Economizer:
  - .1 Factory or site installed.
  - .2 Fully modulating 0-100 percent with minimum position setting.

- .3 Modulating dampers actuator of the spring return type.
- .4 Capable of simultaneous operation with compressor.
- .5 Barometric relief damper) or (power exhaust).
- .6 All wiring and fixed dry bulb control.
- .9 Filters:
  - .1 50 mm thick, fiberglass throwaway filters.
- .10 Thermostats:
  - .1 Electronic seven-day programmable thermostat with setback and setup provisions.
  - .2 Lockable cover guard.
- .11 Acceptable Manufacturers
  - .1 Johnson Controls
  - .2 McQuay
  - .3 Carrier
  - .4 Trane

## 2.3 **ELECTRIC COOL/GAS HEAT ROOFTOP UNITS (25 TO 135 TONS)**

- .1 General
  - .1 Roof mounted self-contained unit with micro-processor based control system, two DX refrigeration systems, gas heating section, outside air system, return air system, filters, switches, supply air fan, return air fan, and all standard safety and operating controls.
    - .1 CSA, CGA, and ULC labels.
    - .2 Rated in accordance with ARI standards.
    - .3 Insulation and adhesives: to NFPA 90A requirements.
  - .2 Factory assembled, piped, wired, tested and shipped to site in one piece. Units specifically designed for outdoor application.
  - .3 Shipped fully charged with refrigerant R410A.
  - .4 Units shall be variable air volume.
- .2 Construction
  - .1 Casing and frame:
    - .1 Fourteen gauge galvanized steel base with formed recess, lifting brackets and lifting holes.
    - .2 Seventeen gauge or heavier, galvanized steel panels painted with a baked-on enamel.

- .3 Insulated cabinet with 25 mm neoprene coated glass fiber insulation secured to all panels with adhesive and mechanical fasteners.
- .4 Floor with double wall construction and 50 mm neoprene coated fiberglass insulation sandwiched between inner and outer liners.
- .5 Unit cabinet designed to operate at total static pressure up to 5.5" w.g.
- .6 Hinged access doors with flush mounted, single lever latching mechanisms, stainless steel hinges and vinyl gasketting.
- .7 Minimum one access door for each unit section.
- .8 1.2 m long empty section between standard filter and supply fan sections to house variable speed drive.
- .2 Supply and return fans:
  - .1 Double width double inlet.
  - .2 Centrifugal forward curved type or Class II airfoil type.
  - .3 Cold rolled steel or continuous galvanized steel forward curved wheel and housing.
  - .4 Aluminum airfoil fan wheel with blades continuously welded to back plate and end rim.
  - .5 Solid steel fan shaft mounted in heavy duty 200,000 hour greaseable ball bearings.
  - .6 Completely isolated fan assembly from unit bulkhead.
  - .7 Fan assembly mounted on 50 mm. Deflection spring isolators.
  - .8 High efficiency motors, open drip-proof type with greaseable ball bearings.
  - .9 Motors with variable pitch sheaves and mounted on adjustable base.
  - .10 Statically and dynamically balanced.
- .3 Condensing section:
  - .1 Heavy duty compressors with reversible positive displacement oil pump, suction and discharge service valves, crankcase heaters and solid state thermal overload protection.
  - .2 Independent refrigeration circuit for each compressor.
  - .3 Spring isolators for each compressor.
  - .4 Pump down on all refrigerant circuits.
  - .5 Hot gas bypass with solenoid valve and hot gas bypass valve.
- .4 Each refrigeration circuit:
  - .1 Sight glass and filter dryer.
  - .2 Vibration line isolators.

- .3 Manual shut off valve.
- .4 Spring type high pressure relief valve.
- .5 Each compressor control:
  - .1 Liquid line solenoid valve.
  - .2 Oil pressure switch.
  - .3 High/low pressure switches.
  - .4 Compressor control circuit switch.
  - .5 Pumpdown switch.
  - .6 Adjustable timer lockout.
  - .7 Minimum stages of refrigeration system capacity control as follows:

Unit size (Tons)	Stages
25, 30, 35	100/66/33/0
40, 45, 50, 60	100/75/50/25/0
70, 75, 80, 90	100/83/67/50/33/10/0
105, 115, 125, 135	100/88/75/63/50/38/25/12/0
- .8 Multi-row type condenser coil fabricated from seamless copper tubing mechanically bonded to aluminum fins.
- .9 Direct drive, steel construction, propeller type condenser fans.
- .10 Heavy duty condenser fan motors, inherently protected, three-phase non reversing type, with permanently lubricated ball bearings and rain shield.
- .6 Cooling coil section:
  - .1 Multi-row type evaporator coil fabricated from seamless copper tubing mechanically bonded to aluminum fins.
  - .2 Adjustable thermal expansion valve per refrigeration circuit.
  - .3 Mastic coated primary drain pan extended underneath the coil connections.
  - .4 Secondary mastic coated drain pan connected to primary drain pan.
- .7 Gas heating section:
  - .1 Welded stainless steel primary and secondary heat exchangers.
  - .2 Flame observation port opposite the burner.
  - .3 Condensate drain for the heat exchanger.
  - .4 Factory fired and tested burner suitable for final site adjustments.
  - .5 Fully modulating forced draft burner with minimum 3:1 turndown.

- .6 Burner accessories to include flame supervision, combustion air proving switch, integral prepurge timing, intermittent pilot with spark ignition and a complete gas train.
- .7 Complete gas train to include main gas valve, main pressure regulator, main shut off cock, pilot gas valve, pilot gas pressure, pilot cock, and electronic flame supervision.
- .8 Burner and controls housing vestibule with hinged access door.
- .9 Gas pressure regulators in gas train to suit existing gas distribution pressure.
- .8 Filter section:
  - .1 Galvanized steel filter racks as an integral part of the unit.
  - .2 Accessible from both sides on unit.
  - .3 Refer to schedules on Drawings.
- .9 Economizer and return air section:
  - .1 Outside, return, and exhaust air dampers sized to handle 100% outside air.
  - .2 Dampers of low leakage type with gasketed blade to blade contact and spring side seals.
  - .3 Adjustable potentiometer and adjustable enthalpy control.
  - .4 Modulating spring return type damper motor.
- .10 Roof curb:
  - .1 Minimum 400 mm high manufactured by the unit manufacturer.
  - .2 Twelve gauge galvanized steel with 50 x 100 mm wood nailer.
  - .3 Suitable for complete air handling section support and condensing section rail support.
  - .4 Continuous gasket for weatherproof installation.
- .3 Controls
  - .1 Variable speed drive control system:
    - .1 Factory wired, mounted and adjusted system.
    - .2 Heavy duty, reversible, electric type actuators with feedback capability.
    - .3 Microprocessor controlled system.
    - .4 Factory mounted high pressure switch with programmable pressure setpoint.
    - .5 Duct high limit safety switch.
    - .6 Remote static pressure sensor(s).
  - .2 Morning warm-up cycle:

- .1 Fully controlled by the rooftop unit DDC controller.
- .4 Unit Mounted DDC Controls
  - .1 Standalone DDC microprocessor based, bi-directional communicating control system to operate the cooling, heating, minimum outside air and economizer operation as shown on the control sequence.
    - .1 A thirty-two character display.
    - .2 Keypad access to all information and controls.
    - .3 Capability to accept a remote 4-20 mA signal for air temperature reset and demand limit.
    - .4 Fourteen day time clock.
    - .5 Current and past alarm storage capability.
    - .6 Night set back control.
    - .7 Adjustable override timer.
    - .8 A setback sensor (room sensor) with override button for field installation.
  - .2 Monitor the following conditions:
    - .1 Refrigerant high pressure.
    - .2 Loss of charge.
    - .3 Loss of air flow.
    - .4 Dirty filters.
    - .5 Minimum outside air.
    - .6 Furnace status.
    - .7 Compressor short cycle.
    - .8 Low pressure.
    - .9 High or low voltage.
    - .10 Air and refrigerant temperature.
    - .11 Phase loss or reversal.
    - .12 Supply and return fans VSD status.
    - .13 Duct static pressure.
  - .3 Unit controller communicates directly with building management system to monitor the following:
    - .1 Discharge and return temperature.
    - .2 Space and outside air temperature.
    - .3 Filter differential pressure.

- .4 Fan, compressor run hours.
    - .5 Unit status.
    - .6 Outside air damper position.
    - .7 Mixed air temperature.
    - .8 Alarm status.
    - .9 Supply and return fans VSD status.
    - .10 Duct static pressure.
  - .4 Unit controller to permit change in setpoint or status of the following:
    - .1 Discharge air temperature setpoint and reset parameters.
    - .2 Minimum outdoor air setpoint.
    - .3 Occupied heat/cool setpoint.
    - .4 Control mode.
    - .5 Space temperature setpoint.
    - .6 Filter differential pressure setpoint.
    - .7 Unoccupied override.
    - .8 Unit status - start/stop/clear fault.
    - .9 Static pressure setpoints.
    - .10 VSD and fan tracking setpoints.
  - .5 Remote Monitoring Panel
    - .1 One panel per rooftop unit complete with:
      - .1 Heat-Off-Cool system switch.
      - .2 On-Off switch.
      - .3 Supply fan operation signal light.
      - .4 Cooling and heating malfunction signal lights.
      - .5 Clogged filters signal light
      - .6 Two additional indicating lights for field hook-up.
- 3 Execution
- 3.1 **INSTALLATION**
  - .1 Install rooftop units as per manufacturer's instructions on roof curbs provided by the manufacturer.
  - .2 Manufacturer to certify installation, supervise start-up and commission units.
  - .3 Install and wire all accessories shipped loose with units for fully operating systems.

End of Section

(THIS PAGE INTENTIONALLY LEFT BLANK)

- 1 General
- 1.1 **SUMMARY**
  - .1 Section Includes
    - .1 Labour, Products, equipment and services necessary to complete the Work of this section.
- 1.2 **REFERENCE STANDARDS**
  - .1 Comply with the latest edition of the following:
    - .1 ANSI/ASHRAE/IESNA 90.1
    - .2 ANSI/ARI Standard 390
    - .3 CSA C22.2
- 1.3 **SUBMITTALS**
  - .1 Shop Drawings
    - .1 Submit Shop Drawings in accordance with Section 01 33 00.
  - .2 Operation and Maintenance Data
    - .1 Submit printed operation instructions and maintenance data in accordance with Section 01 33 00.
- 2 Products
- 2.1 **SPLIT-SYSTEM HEAT PUMP UNIT**
  - .1 Capacity, performance requirements, and configuration shall be as scheduled and specified.
  - .2 Provide fully packaged and factory tested indoor evaporator unit complete with control system, DX refrigeration system, supply air fan, filters.
  - .3 Provide fully packaged and factory tested remote outdoor condensing unit complete with built-in starter, contactors, controls, transformers, and weatherproof disconnect switch.
  - .4 Compressor to be inverter.
  - .5 Ship units fully charged with refrigerant R410A.
  - .6 Interconnect indoor evaporator unit and outdoor condensing unit with liquid and suction refrigerant lines. Refrigerant lines shall be insulated with cellular elastomer.
  - .7 Provide wired controller. Controller to be interlocked with electric heater where indicated on Drawings.
  - .8 Provide low (-20°C) ambient operation kit.
  - .9 Auto restart after power failure.
  - .10 Acceptable Manufacturers
    - .1 Mitsubishi
    - .2 Daikin

3 Execution

3.1 **GENERAL**

- .1 Install unit and accessories as per manufacturer's instructions.
- .2 Manufacturer to certify installation, and start-up and commission units.
- .3 Install miscellaneous steel framing, supports, braces, etc. as required to hang or support equipment and ductwork as specified herein, and as shown on Drawings.
- .4 Install and wire all accessories shipped loose with units for fully operating systems.

End of Section

1 General

1.1 **REFERENCES**

- .1 CSA, Canadian Standards Association.
- .2 ULC, Underwriters' Laboratories of Canada.

1.2 **SUBMITTALS**

- .1 Submit the following Product data and Shop Drawings in one package.

- .1 Product Data:

- .1 Submit copies of manufacturer's product data in accordance with Section 01 33 00 Submittal Procedures, indicating:

- .1 Product characteristics.
    - .2 Performance criteria, minimum operating air flow.
    - .3 Mounting methods, unit support.
    - .4 Physical size.
    - .5 KW rating, voltage, phase.
    - .6 Cabinet material thicknesses.
    - .7 Limitations, clearance to combustibles.
    - .8 Colour and finish.

- .2 Shop Drawings:

- .1 Submit Shop Drawings in accordance with Section 01 33 00 Submittal Procedures, indicating:

- .1 Equipment, capacity and piping connections.
    - .2 Dimensions, internal and external construction details, recommended method of installation with proposed structural steel support, sizes and location of mounting bolt holes.

- .3 Commissioning

- .1 Submit Commissioning Plan, Commissioning Procedures, Certificate of Readiness, Deficiency Report and Commissioning Closeout Report, in accordance with Division 23.
  - .2 Submit design data and test reports.
  - .3 Submit inspection and test reports.

- .4 Closeout Submittals

- .1 Submit the following for incorporation into Operation and Maintenance Manuals in accordance with Section 01 33 00 Submittal Procedures.

- .1 Identification: Manufacturer name, type, year, serial number, number of units, and capacity.
    - .2 Functional description detailing operation and control.
    - .3 Performance criteria and maintenance data.
    - .4 Operating instructions and precautions.
    - .5 Component parts availability including names and addresses of spare part Suppliers.
    - .6 Lubrication schedule, maintenance and troubleshooting guidelines.
  - .2 Manufacturer's installation instructions for the following items:
    - .1 Force flow heater.
  - .3 Submit As-Built Drawings in accordance with Section 01 33 00 Submittal Procedures.
- 2 Products
- 2.1 **ELECTRIC FORCED AIR HEATER (FAH)**
  - .1 Manufacturers:
    - .1 Ouellet
    - .2 Chromalox (Dimplex)
    - .3 Stelpro
  - .2 Construction: 0.8 mm thick steel (20 ga) removable and tamperproof panel, glass fibre insulation and integral air outlet and inlet.
  - .3 Finish: Polyester epoxy powder coat, white.
  - .4 Electric coils: durable tubular heating element with fins.
  - .5 Fans: statically and dynamically balanced, direct driven, sleeve bearings, resilient mounted,
  - .6 Motor: Totally enclosed type with permanently lubricated bearings, built-in thermal overload protection and resilient rubber isolation mounting.
  - .7 Capacity: As per Drawing.
  - .8 Built-in disconnect switch.
  - .9 Controls
    - .1 On-off switch with integral overloads in cabinet.
    - .2 Remote wall-mounted thermostat.
    - .3 120 V control circuit with magnetic contactor and transformer.
    - .4 High temperature limit switch.
  - .10 Units must be UL and CSA approved.

## 2.2 **ELECTRIC UNIT HEATER**

- .1 Manufacturers:
  - .1 Ouellet Model OAS
  - .2 Chromalox (Dimplex)
  - .3 Stelpro
- .2 Construction: 18 gauge steel cabinet with threaded connections for hanger rods.
- .3 Finish: Epoxy powder coat, white.
- .4 Heating coil: Low surface temperature, seamless copper sheathed tubular elements, low-watt density.
- .5 Fan: Propeller type, dynamically and statically balanced, epoxy coated aluminum construction and fan guard.
- .6 Motor: Totally enclosed type with permanently lubricated bearings, built-in thermal overload protection and resilient rubber isolation mounting.
- .7 Air outlet: Two-way adjustable louvres.
- .8 Capacity: As per Drawing schedule.
- .9 Built-in disconnect switch.
- .10 Controls
  - .1 Remote wall-mounted thermostat.
  - .2 120 V control circuit with magnetic contactor and transformer.
  - .3 High temperature limit switch.
- .11 Units must be UL and CSA approved

## 3 Execution

### 3.1 **EXAMINATION**

- .1 Review proposed locations on-site and co-ordinate installation requirements with general trades, architectural finishes and power requirements.

### 3.2 **INSTALLATION**

- .1 Install in accordance with manufacturer's instructions.
- .2 Check final location with Consultant if different from that indicated prior to installation. Should deviations beyond allowable clearances arise, request and follow Consultant's direction.
- .3 Clean finned tubes and comb straight.
- .4 Provide supplementary suspension steel as required.
- .5 Install thermostats in locations indicated.
- .6 Before acceptance, set discharge patterns and fan speeds to suit requirements.

3.3 **COMMISSIONING**

- .1 Perform Commissioning in accordance with Section 23 08 23 Mechanical Commissioning.
- .2 Verify operational performance in general conformance with the following outline:
  - .1 Operational performance outline:
    - .1 Thermostat operation.
    - .2 Element response.
    - .3 Fan operation.
    - .4 Disconnect.
    - .5 Other unit control features/devices.
  - .2 Functional performance outline:
  - .3 Interlocks with associated equipment.
  - .4 Interface with adjacent building components.

3.4 **PROTECTION**

- .1 Protect from damage during construction. Do not operate during construction or until unit and area thoroughly cleaned and inspected.

End of Section

- 1 General
  - 1.1 **SUMMARY**
    - .1 Section Includes
      - .1 Labour, Products, equipment and services necessary to complete the Work of this section including, but not limited to, the following:
        - .1 Radiant ceiling panels
  - 1.2 **SUBMITTALS**
    - .1 Shop Drawings
      - .1 Submit Shop Drawings in accordance with Section 01 33 00.
    - .2 Operation and Maintenance Data:
      - .1 Submit printed operation instructions and maintenance data in accordance with Section 01 33 00.
- 2 Products
  - 2.1 **RADIANT CEILING PANELS**
    - .1 General
      - .1 Extruded aluminum radiant heating ceiling panels of the size and output shown on Drawings. Refer to architectural reflected ceiling plans, room finish schedules, and Mechanical Drawings to determine location, quantity, and finish of radiant panels.
      - .2 Panel to run continuously from wall to wall as shown on Drawings.
      - .3 Output based on a mean water temperature of 82°C (180°F) and room temperature of 21°C (70°F)
    - .2 Construction
      - .1 Tube saddles integral part of extruded panels.
      - .2 0.625 mm OD copper tubing mechanically fastened to panel. Apply non-hardening heat transfer paste between tubing and panel.
      - .3 Panels interlock with tongue and groove connection without visible joints and reinforced with aluminum cross channels. All panel section interlocking preformed at the factory with return bends installed and pressure tested. Field connections limited to connections to mains and connections to adjacent panel.
      - .4 Finish panels in white high emissivity paint suitable for repainting to colour specified later, or silkscreen finish to match adjacent acoustic tile ceiling.
    - .3 Accessories
      - .1 Provide built in linear diffuser over the entire length of the panel. Refer to HVAC floor plans for diffuser details. Diffuser and supply air boot by same manufacturer.
    - .4 Acceptable Manufacturers

- .1 Airtex Radiant Systems (Engineered Air)
- .2 Twa Panel Systems (R&D Energy Savers)
- .3 Rosemex (Kilmer Environmental Inc.)

3 Execution

3.1 **PANELS**

- .1 Install units as per manufacturer's instructions and as shown on Drawings.
- .2 Install accessories shipped loose with units for fully operating systems.

3.2 **RADIANT CEILING PANELS**

- .1 Coordinate with Division 9 and Ceiling Contractor to assure proper division of Work. Support panels on moldings to match ceiling finish and supports.
- .2 Install hanger supports for safety independent of the ceiling support system. Follow manufacturers' recommendations for size and quantity of hangers except provide a minimum of four wire supports per panel.
- .3 Install miscellaneous steel framing, supports, braces, etc. as required to hang or support equipment as specified herein, and as shown on Drawings.
- .4 Field trim panels to length where necessary to provide a continuous wall to wall appearance. Allow adequate expansion allowance.
- .5 Connect panels with manufacturer supplied copper pigtail connections.
- .6 Clean flush and pressure test system as specified elsewhere in Division 23 Specifications.
- .7 Install minimum 25 mm thick fiberglass insulation on top of radiant panels, with aluminum foil facing faced down to radiant panel.

End of Section

- 1 General
- 1.1 **SUMMARY**
  - .1 Section Includes
    - .1 Labour, Products, equipment and services necessary to complete the Work of this section.
- 1.2 **SUBMITTALS**
  - .1 Shop Drawings
    - .1 Submit Shop Drawings in accordance with Section 01 33 00.
- 2 Products
- 2.1 **SELF GENERATING ELECTRIC TYPE STEAM HUMIDIFIERS**
  - .1 General
    - .1 Self-contained, electronically controlled, complete with all controls and distribution headers suitable for the specified application.
      - .1 ULC and CSA approved.
    - .2 Refer to schedule on Drawings for performance.
  - .2 Electric Pan Type
    - .1 Construction:
      - .1 Stainless steel vaporizing chamber with removable cover and gasket.
      - .2 Immersion type alloy sheathed heaters.
      - .3 Factory mounted and wired manual reset temperature switch.
      - .4 Factory mounted and wired door interlock safety switch.
      - .5 Electronic water level control with automatic refill, low water cut-off and bleed off functions.
      - .6 Clean out tray.
      - .7 Surface water skimmer system.
      - .8 Three levels of heater protection.
      - .9 Factory mounted control cabinet including microprocessor controller, contacts, control circuit, transformer and fuses.
      - .10 Electronic water level control complete with solenoid operated automatic refill, low water cut-off and skimmer bleed off functions.
    - .2 Controls:
      - .1 Fully modulating control 0 to 100% capacity.
      - .2 Duct mounted air proving switch.
      - .3 Duct high limit humidistat.

- .4 Modulating duct mounted humidistat.
- .3 Unit mounted microprocessor based control panel with the following features:
  - .1 Software self-diagnosis.
  - .2 Water level control.
  - .3 Timer operated drain/flush sequence.
  - .4 End of season drain down.
  - .5 Four position manual override.
  - .6 Multiple heater cycling.
  - .7 Connection terminals for remote fault indication.
  - .8 Field adaptable humidistat input signal.
  - .9 Fully modulating steam output control.
- .4 Acceptable Manufacturers:
  - .1 DriSteam
  - .2 Armstrong
- .3 Electrode Type
  - .1 Construction:
    - .1 Two independent compartments with front access doors.
    - .2 Disposable cylinder type.
    - .3 Independent control circuit and safety for each cylinder.
    - .4 Manual output adjustments (20 to 100%).
    - .5 Auto adaptive control.
    - .6 Full front access.
    - .7 Alphanumeric LCD display and keypad.
    - .8 Self diagnostics control.
    - .9 Solenoid control of supply and drain water.
    - .10 Automatic off season shut down.
    - .11 Steam distributor with condensate separator and return leg.
    - .12 Fill cup with internal 25 mm air gap.
  - .2 Controls:
    - .1 Fully modulating control 0 to 100% capacity.
    - .2 Wall mounted electronic humidistat with locking cover, concealed adjustment and locking stops.

- .3 Duct mounted air flow proving switch.
- .4 Modulating duct mounted high limit control.
- .3 Acceptable Manufacturers:
  - .1 Nortec
  - .2 Carnes
- .4 Element Type
  - .1 Construction:
    - .1 Two independent compartments with hinged lockable doors.
    - .2 14 gauge aluminum casing with backed enamel finish.
    - .3 Easily removable stainless steel cleanable evaporation container.
    - .4 Electric heating immersion element.
    - .5 Level control.
    - .6 Internal electronic temperature sensor.
    - .7 External bimetallic temperature sensor.
    - .8 Water supply solenoid valve.
    - .9 Port motorized drain line ball valve with adjustable timer.
    - .10 Electronic level sensing assembly.
    - .11 Manual reset high temperature safety cut-out switch.
    - .12 Quick disconnect safety overflow connection and drain port.
    - .13 Electrical wiring quick connectors.
    - .14 Stainless steel steam distributor suitable for the application and complete with condensate separator and return leg.
  - .2 Micro-Processor Controller:
    - .1 Unit mounted microprocessor controller with alphanumeric display of the actual steam output, water level, and special diagnostics parameters such as abnormal operation, time delays, etc.
    - .2 Percent relative humidity.
    - .3 Set point.
    - .4 Frequency of drain cycles.
    - .5 Output span control.
    - .6 Number of actual service hours.
  - .3 Controls:
    - .1 Field adjustable fully modulating control to provide 0 to 100% capacity.

- .2 Wall mounted electronic humidistat.
- .3 High limit humidistat.
- .4 Pressure differential switch.
- .5 Field adjustable fully modulating control to provide 0 to 100% capacity.
- .6 Wall mounted electronic humidistat.
- .7 Duct mounted proportional high limit humidistat.
- .8 Pressure differential switch.

.4 Acceptable Manufacturers

- .1 Neptronic
- .2 DriSteam
- .3 Pure Steam
- .4 Armstrong

3 Execution

3.1 **INSTALLATION**

.1 General

- .1 Install humidifiers in accordance with manufacturer's instructions.
- .2 Manufacturer to certify installation, supervise start-up and commission units.
- .3 Install and wire all accessories shipped loose with units for fully operating systems.

.2 Self Generating Electric Type

- .1 Connect cold water make-up line to solenoid valve and provide drain piping as per manufacturer's instruction. Run drain piping to nearest drain.
- .2 Install steam piping between generator and steam distributor using schedule 40 black steel with malleable iron screwed fittings.
- .3 Install condensate piping from pan and generator using type L hard drawn copper with copper solder joint fittings.

.3 Injection Type Humidifiers

- .1 Install steam trap, strainer, control valve, piping and internal steam distributor support for each humidifier.

End of Section

1 General

1.1 **SUMMARY**

.1 Section Includes

- .1 Labour, Products, equipment and services necessary to complete the work of this section.
- .2 Section includes, but is not necessarily limited to, the following:
  - .1 Wire or pipe remote instrumentation required to operate package systems supplied by others. Modulating thermostats for these systems must match the system component characteristics.
  - .2 Supply, install and connect all control wiring for the systems described.
  - .3 Control wiring of components for systems listed herein requiring 120V or less. Included are such items as remotely mounted interlocks, sensors, 120V supply to refrigerated air dryers, seven day timers, etc.
- .3 Coordinate the work of this Division with other trades to obtain their electrical input for the electrical control schematics.
- .4 Advise and coordinate this Work with all associated trades and balancing technicians.

.2 Intent

- .1 It is the Owner's intent to expand the existing BAS network to accommodate the new HVAC equipment and other specified controlled or monitored points.
- .2 The new Work associated with this Project shall seamlessly integrate to the existing BAS, maintaining all existing controls, system operations and control strategies. Update and upgrade the existing web servers (hardware and software) to include new system graphics and floor plans to conform to the new system and floor plan layouts.
- .3 The new Work of this Project shall reside on the existing high-speed, peer-to-peer network of DDC controllers and a web-based operator interface. Operators shall be able to perform all normal operator functions through the web browser interface from any operator terminal.
- .4 The system shall directly control HVAC equipment as specified in this Section as well as integrate to mechanical and electrical systems using the open BACnet communication protocol.
- .5 Provide energy conservation features such as optimal start and stop, night setback, request-based logic, and demand level adjustment of setpoints as specified.
- .6 Dynamic colour graphics shall be provided as specified in this Section, including indication of thermal comfort on floor plan summary graphics using dynamic colours to represent zone temperature relative in zone setpoint and zone (7 colour levels).
- .7 To ensure interoperability with all systems building automation system shall be 100% native-BACnet (at all levels) as specifically detailed by this Section. System shall use the BACnet protocol for communication to the operator workstation or web server and for communication between control modules.

Schedules, setpoints, trends and alarms specified in this Section shall be BACnet objects.

## 1.2 **CODES, REGULATIONS AND STANDARDS**

- .1 Comply with municipal or provincial codes, rules and regulations and/or authorities having jurisdiction.
- .2 Comply with the National Building Code in areas where municipal or provincial regulations and/or codes are not mandatory.
- .3 All Work shall conform to the following Codes and Standards, as applicable:
  - .1 National Fire Protection Association (NFPA) Standards
  - .2 Ontario Electric Safety Code
  - .3 National Electrical Code
  - .4 Underwriters Laboratories Canada (ULC) listing and labels.
  - .5 UL 916 Energy Management
  - .6 NFPA 90A – Standard for the Installation of Air Conditioning and Ventilation Systems
  - .7 ASHRAE 90.1
  - .8 Occupational Health and Safety Act (OHSA)
  - .9 Federal Communications Commission (FCC) including Part 15, Radio Frequency Devices.
  - .10 ASHRAE 195 (BACnet)
- .4 In the case of conflicts or discrepancies, the more stringent regulation shall apply.
- .5 All work shall meet the approval of the Authorities Having Jurisdiction at the project site.

## 1.3 **MATERIAL APPROVALS**

- .1 Obtain special inspection and approvals by CSA and/or local authorities, for materials where specified.
- .2 Obtain such approval for the particular installation with the cooperation of the material supplier.

## 1.4 **PERMITS AND INSPECTIONS**

- .1 Obtain permits required for the installation of mechanical trades work including:
  - .1 Electrical inspection
- .2 Arrange for inspections and tests and pay all fees and costs for the permits, inspections and tests. Obtain permits immediately after notification of award of Contract.
  - .1 Obtain copies of Drawings from the Consultant for submission with application for permits.

## 1.5 **RELATED WORK**

- .1 The following equipment will be supplied and installed under other sections or divisions.

- .1 Manual balancing dampers, fire dampers, combination fire and smoke dampers, and gravity dampers: Division 23.
- .2 Automatic control dampers supplied as an integral part of equipment. E.g. mixing box dampers and face and bypass dampers unless otherwise noted: Division 21, 22, 23 and 26.
- .3 Direct expansion cooling valves: Division 23.
- .4 Refrigerant solenoid valves: Division 23.
- .5 Multizone dampers unless otherwise noted: Division 23.

1.6 **ITEMS TO BE SUPPLIED UNDER THIS SECTION AND INSTALLED UNDER OTHER SECTIONS**

- .1 Supply the following equipment to the appropriate mechanical trades for installation in accordance with instructions from, and under the supervision of, the Automatic Controls Subcontractor:
  - .1 Motorized dampers.
  - .2 Variable volume terminal unit operators. (These operators will be installed on the terminal units by the terminal unit Supplier)

1.7 **WORK UNDER OTHER CONTRACTS OR DIVISIONS**

- .1 The following equipment will be supplied and installed by other trades or Contractors:
  - .1 Door limit switches for automatic temperature controls.
  - .2 Electrical items of work as defined hereinafter
  - .3 All line/load side power wiring.
  - .4 Combination starters or contractors complete with integral pushbuttons, Hand-Off-Auto switches, etc. unless otherwise specified.
  - .5 All controls and wiring for:
    - .1 Fire alarm control system

1.8 **PRODUCT AVAILABILITY**

- .1 Product Development
  - .1 All Products to be new, currently under manufacture, and have been applied in similar installations for a minimum of two years.
  - .2 The installation shall not be used as a test site for new Products unless explicitly approved by the Owner's Representative in writing prior to bid date.
- .2 Spare Parts
  - .1 Spare parts to be available for at least five years after completion of this Contract.

1.9 **COORDINATION AND EXAMINATION**

- .1 Examination
  - .1 Carefully examine Work and Drawings of all related trades and thoroughly plan the Work so as to avoid interferences.

- .2 Report defects which would adversely affect the Work. Do not commence installation until such defects have been corrected.

- .2 Coordination

- .1 Coordinate Work of this division such that items will properly interface with Work of other divisions. Prepare Installation Drawings of critical locations and submit to Consultant for review.
- .2 Architectural Drawings, or in their absence, Mechanical Drawings govern all locations.

#### 1.10 **SUBMITTALS**

- .1 Shop Drawings, Product Data and Samples

- .1 The BMS contractor shall submit a list of all Shop Drawings with submittal dates within 30 days of Contract award.
- .2 Submittals shall be in defined packages. Each package shall be complete and shall only reference itself and previously submitted packages. The packages shall be as approved by the Architect and Engineer for Contract compliance.
- .3 Allow 15 working days for the review of each package by the Architect and Engineer in the scheduling of the total BMS work.
- .4 Equipment and systems requiring approval of local authorities must comply with such regulations and be approved. Filing shall be at the expense of the BMS correspondence and permits to the Owner.
- .5 Prepare an index of all submittals and shop drawings for the installation. Index shall include a Shop Drawing identification number, Contract Documents reference and item description.
- .6 The BMS Contractor shall correct any errors or omissions noted in the first review.
- .7 At a minimum, submit the following:
  - .1 BMS network architecture diagrams including all nodes and interconnections;
  - .2 Systems schematics, sequences and flow diagrams;
  - .3 Points schedule for each point in the BMS, including: Point Type, Object Name, Expanded ID, Display Units, Controller type and Address;
  - .4 Samples of Graphic Display screen types and associated menus;
  - .5 Detailed Bill of Material list for each system or application, identifying quantities, part numbers, descriptions and optional features;
  - .6 Control Damper Schedule including a separate line for each damper provided under this section and a column for each of the damper attributes, including: Code Number, Fail Position, Damper Type, Damper Operator, Duct Size, Damper Size, Mounting and Actuator Type;
  - .7 Room Schedule including a separate line for each VAV box and/or terminal unit indicating location and address;
  - .8 Control Valve Schedules including a separate line for each valve provided under this section and a column for each of the valve attributes:

Code Number, Configuration, Fail Position, Pipe Size, Valve Size, Body Configuration, Close off Pressure, Capacity, Valve CV, Design Pressure and Actuator Type;

- .9 Details of all BMS interfaces and connections to the work of other trades; and
- .10 Product data sheets or marked catalog pages including part number, photo and description for all products including software.

.2 Record Documentation

.1 Operation and Maintenance Manuals

- .1 Three (3) copies of the Operation and Maintenance Manuals shall be provided to the Owner's Representative upon completion of the project. The entire Operation and Maintenance Manual shall be furnished on Compact Disc media, and include the following for the BMS provided:
  - .1 Table of contents;
  - .2 As-built system record drawings. Computer Aided Drawings (CAD) record drawings shall represent the as-built condition of the system and incorporate all information supplied with the approved submittal;
  - .3 Manufacturer's product data sheets or catalog pages for all products including software;
  - .4 System Operator's manuals;
  - .5 Archive copy of all site-specific databases and sequences;
  - .6 BMS network diagrams; and
  - .7 Interfaces to all third-party products and work by other trades.
- .2 The Operation and Maintenance Manual CD shall be self-contained and include all necessary software required to access the product data sheets. A logically organized table of contents shall provide dynamic links to view and print all product data sheets. Viewer software shall provide the ability to display, zoom and search all documents.

1.11 **TRADE QUALIFICATIONS**

.1 Applicable to the following trades:

- .1 Electricians.

.2 Requirements

- .1 Trade workers to have a certificate of qualification as journeyman or apprentice registration for the province where the Work is performed, or an interprovincial certificate.
- .2 Ratio of journeyman to apprentice: Not to exceed the defined ratio in the Apprenticeship Act of Ontario.
- .3 Certificates and registration must be provided to the Consultant on request.
- .4 Maintain on-site an up-to-date record listing journeyman and apprentices working on site.

- .5 Electricians to be part of IBEW. Electricians not part of IBEW need to submit reference letter with minimum 3 references at least 48 hours in advance of tender closing.

## 1.12 **PRODUCT DELIVERY, STORAGE AND HANDLING**

- .1 Seal instruments after manufacture and inspection and remain sealed until ready for installation.
- .2 Handle instruments and equipment carefully handled and protect from weather, dust and construction materials.

## 2 **Products**

### 2.1 **MATERIALS AND EQUIPMENT**

- .1 Use new materials and equipment, free from defects impairing strength and durability, as specified or specified equivalent.
- .2 Manufactured in Canada wherever possible.
- .3 Labelled or listed as required by code and/or inspection authorities.

### 2.2 **STANDARD SPECIFICATIONS**

- .1 Ensure that the chemical and physical properties, design, performance characteristics and methods of construction of all Products provided comply with the latest issue of applicable standard Specifications issued by authorities having jurisdiction.
- .2 Do not apply such standard Specifications to decrease the quality of workmanship, Products and services required by the Contract Documents.

### 2.3 **BMS GENERAL SYSTEM PERFORMANCE REQUIREMENTS**

- .1 Suppliers/Installers
  - .1 Supplied and installed by a Control Subcontractor specializing in such work. AS far as practical, all control equipment to be the products of a single manufacturer.
  - .2 Bids by Wholesalers, Contractors, Franchised Dealers or any firm whose principal business is not that of manufacturing and installing automatic temperature control systems shall not be acceptable.
  - .3 Single source responsibility of supplier shall be the complete installation and proper operation of the (BMS and) control system, including commissioning and proper calibration of each component in the entire system.
  - .4 An in-place support facility within 50 kilometers of the site with technical staff, spare parts inventory and all necessary test and diagnostic equipment.
  - .5 Standard of Acceptance:
    - .1 Johnson Controls
    - .2 Honeywell
    - .3 Automated Logic
- .2 General Description
  - .1 The Building Management System (BMS) shall use an open architecture and fully support a multi-vendor environment. To accomplish this effectively, the BMS shall support open communication protocol standards and integrate a

variety of third-party devices and applications. The system shall be designed for use on the Internet, or intranets using off the shelf, industry standard technology compatible with other owner provided networks.

.2 The Building Management System shall consist of the following:

- .1 Standalone Network Automation Engine(s)
- .2 Field Equipment Controller(s)
- .3 Input/Output Module(s)
- .4 Local Display Device(s)
- .5 Portable Operator's Terminal(s)
- .6 Distributed User Interface(s)
- .7 Network processing, data storage and communications equipment
- .8 Other components required for a complete and working BMS

.3 The system shall be modular in nature, and shall permit expansion of both capacity and functionality through the addition of sensors, actuators, controllers and operator devices, while re-using existing controls equipment.

.4 System architectural design shall eliminate dependence upon any single device for alarm reporting and control execution.

- .1 The failure of any single component or network connection shall not interrupt the execution of control strategies at other operational devices.
- .2 The System shall maintain all settings and overrides through a system reboot.

.5 System architectural design shall eliminate dependence upon any single device for alarm reporting and control execution.

.3 BMS Architecture

.1 Automation Network

- .1 The automation network shall be based on a PC industry standard of Ethernet TCP/IP. Where used, LAN controller cards shall be standard "off the shelf" products available through normal PC vendor channels.
- .2 The BMS shall network multiple user interface clients, automation engines, system controllers and application-specific controllers. Provide application and data server(s) as required for systems operation.
- .3 All BMS devices on the automation network shall be capable of operating at a communication speed of 100 Mbps, with full peer-to-peer network communication.
- .4 Network Automation Engines (NAE) shall reside on the automation network.
- .5 The automation network will be compatible with other enterprise-wide networks. Where indicated, the automation network shall be connected to the enterprise network and share resources with it by way of standard networking devices and practices.

.2 Control Network

- .1 Network Automation Engines (NAE) shall provide supervisory control over the control network and shall support at the minimum both of the following communication protocols:
  - .1 BACnet Standard MS/TP Bus Protocol ASHRAE SSPC-135, Clause 9
    - .1 The NAE shall be BACnet Testing Labs (BTL) certified and carry the BTL Label.
    - .2 The NAE shall be tested and certified as a BACnet Building Controller (B-BC).
  - .2 LonWorks enabled devices using the Free Topology Transceiver (FTT-10a).
- .2 Control networks shall provide either "Peer-to-Peer," Master-Slave, or Supervised Token Passing communications, and shall operate at a minimum communication speed of 9600 baud.
- .3 DDC Controllers shall reside on the control network.
- .4 Control network communication protocol shall be BACnet Standard MS/TP Bus Protocol ASHRAE SSPC-135.
- .5 A BACnet Protocol Implementation Conformance Statement (PICS) shall be provided for each controller device (master or slave) that will communicate on the BACnet MS/TP Bus.
- .6 The PICS shall be submitted 10 days prior to bidding.
- .3 Integration
  - .1 Hardwired
    - .1 Analog and digital signal values shall be passed from one system to another via hardwired connections.
    - .2 There shall be one separate physical point on each system for each point to be integrated between the systems.
  - .2 Direct Protocol (Integrator Panel)
    - .1 The BMS system shall include appropriate hardware equipment and software to allow bi-directional data communications between the BMS system and 3rd party manufacturers' control panels. The BMS shall receive, react to, and return information from multiple building systems.
    - .2 All data required by the application shall be mapped into the Network Automation Engine's database, and shall be transparent to the operator.
    - .3 Point inputs and outputs from the third-party controllers shall have real-time interoperability with BMS software features such as: Control Software, Energy Management, Custom Process Programming, Alarm Management, Historical Data and Trend Analysis, Totalization, and Local Area Network Communications.
  - .3 BACnet Protocol Integration – BACnet

- .1 The neutral protocol used between systems will be BACnet over Ethernet and comply with the ASHRAE BACnet standard 135.
- .2 A complete Protocol Implementation Conformance Statement (PICS) shall be provided for all BACnet system devices.
- .3 The ability to command, share point object data, change of state (COS) data and schedules between the host and BACnet systems shall be provided.
- .4 User Interface
  - .1 Dedicated Web Based User Interface
    - .1 All real-time control functions, including scheduling, history collection and alarming, shall be resident in the BMS Network Automation Engines to facilitate greater fault tolerance and reliability.
    - .2 Dedicated User Interface Architecture: The architecture shall be implemented to conform to industry standards, so that it can accommodate applications provided by the BMS Contractor and by other third party applications suppliers, including but not limited to Microsoft Office Applications. Specifically it must be implemented to conform to the following interface standards.
      - .1 Microsoft Internet Explorer or other web browser for user interface functions
      - .2 Microsoft Office Professional or equal for creation, modification and maintenance of reports, sequences other necessary building management functions.
      - .3 Microsoft Outlook or other e-mail program for supplemental alarm functionality and communication of system events and reports.
      - .4 Required network operating system for exchange of data and network functions such as printing of reports, trends and specific system summaries.
    - .3 Operating System Software
      - .1 Windows 10
      - .2 Where user interface is not provided via browser, provide complete operator workstation software package, including any hardware or software keys. Include the original installation disks and licenses for all included software, device drivers, and peripherals.
      - .3 Provide software registration cards to the Owner for all included software.
  - .2 Distributed Web Based User Interface
    - .1 All features and functions of the dedicated user interface previously defined in this document shall be available on any computer connected directly or via a wide area or virtual private network (WAN/VPN) to the automation network and conforming to the following specifications.

- .2 The software shall run on the Microsoft Internet Explorer (6.0 or higher) or other web browser supporting the following functions:
  - .1 Configuration
  - .2 Commissioning
  - .3 Data Archiving
  - .4 Monitoring
  - .5 Commanding
  - .6 System Diagnostics
- .3 Minimum hardware requirements:
  - .1 1GB RAM
  - .2 2.0 GHz Clock Speed Pentium 4 Microprocessor
  - .3 100 GB hard drive
  - .4 1 keyboard with 83 keys (minimum)
  - .5 SVGA 1024x768 resolution display with 64K colours and 16 bit colour depth
  - .6 Mouse or other pointing device
- .3 Site Management User Interface Application Components
  - .1 Operator Interface
    - .1 An integrated browser based client application shall be used as the user operator interface program.
    - .2 The System shall employ an event-driven rather than a device polling methodology to dynamically capture and present new data to the user.
    - .3 All Inputs, Outputs, Setpoints, and all other parameters as defined within this section, shown on the design drawings, or required as part of the system software, shall be displayed for operator viewing and modification from the operator interface software.
    - .4 The user interface software shall provide help menus and instructions for each operation and/or application.
    - .5 The system shall support customization of the UI configuration and a home page display for each operator.
    - .6 The system shall support user preferences in the following screen presentations:
      - .1 Alarm
      - .2 Trend
      - .3 Display
      - .4 Applications

- .7 All controller software operating parameters shall be displayed for the operator to view/modify from the user interface. These include: setpoints, alarm limits, time delays, PID tuning constants, run-times, point statistics, schedules, and so forth.
- .8 The Operator Interface shall incorporate comprehensive support for functions including, but not necessarily limited to, the following:
  - .1 User access for selective information retrieval and control command execution
  - .2 Monitoring and reporting
  - .3 Alarm, non-normal, and return to normal condition annunciation
  - .4 Selective operator override and other control actions
  - .5 Information archiving, manipulation, formatting, display and reporting
  - .6 BMS internal performance supervision and diagnostics
  - .7 On-line access to user HELP menus
  - .8 On-line access to current BMS as-built records and documentation
  - .9 Means for the controlled re-programming, re-configuration of BMS operation and for the manipulation of BMS database information in compliance with the prevailing codes, approvals and regulations for individual BMS applications
- .9 The system shall support a list of application programs configured by the users that are called up by the following means:
  - .1 The Tools Menu
  - .2 Hyperlinks within the graphics displays
  - .3 Key sequences
- .10 The operation of the control system shall be independent of the user interface, which shall be used for operator communications only. Systems that rely on an operator workstation to provide supervisory control over controller execution of the sequences of operations or system communications shall not be acceptable.

.2 Navigation Trees

- .1 The system shall have the capability to display multiple navigation trees that will aid the operator in navigating throughout all systems and points connected. At minimum provide a tree that identifies all systems on the networks.
- .2 Provide the ability for the operator to add custom trees. The operator will be able to define any logical grouping of systems or points and arrange them on the tree in any order. It shall be possible to nest groups within other groups. Provide at minimum 5 levels of nesting.
- .3 The navigation trees shall be “dockable” to other displays in the user interface such as graphics. This means that the trees will appear as part of the display, but can be detached and then minimized to the Windows task bar. A simple keystroke will reattach the navigation to the primary display of the user interface.

.3 Alarms

- .1 Alarms shall be routed directly from Network Automation Engines to PCs and servers. It shall be possible for specific alarms from specific points to be routed to specific PCs and servers. The alarm management portion of the user interface shall, at the minimum, provide the following functions:
  - .1 Log date and time of alarm occurrence.
  - .2 Generate a “Pop-Up” window, with audible alarm, informing a user that an alarm has been received.
  - .3 Allow a user, with the appropriate security level, to acknowledge, temporarily silence, or discard an alarm.
  - .4 Provide the ability to direct alarms to an e-mail address, phone number or alphanumeric pager. This must be provided in addition to the pop up window described above. Systems that use e-mail and pagers as the exclusive means of annunciating alarms are not acceptable.
  - .5 Configuration of which NAE offline alarms are seen by each user
  - .6 Any attribute of any object in the system may be designated to report an alarm.
- .2 The BMS shall annunciate diagnostic alarms indicating system failures and non-normal operating conditions.
- .3 The BMS shall allow a minimum of 4 categories of alarm sounds customizable through user defined wav.files.

- .4 The BMS shall annunciate application alarms at minimum, as required by Specifications and Drawings.

- .4 Reports and Summaries

- .1 Reports and Summaries shall be generated and directed to the user interface displays, with subsequent assignment to printers, or disk. As a minimum, the system shall provide the following reports:

- .1 All points in the BMS
- .2 All points in each BMS application
- .3 All points in a specific controller
- .4 All points in a user-defined group of points
- .5 All points currently in alarm
- .6 All points locked out
- .7 All user defined and adjustable variables, schedules, interlocks and the like.

- .2 Summaries and Reports shall be accessible via standard UI functions and not dependent upon custom programming or user defined HTML pages.

- .3 Selection of a single menu item, tool bar item, or tool bar button shall print any displayed report or summary on the system printer for use as a building management and diagnostics tool.

- .4 Provide the capability to view, command and modify large quantities of similar data in tailored summaries created online without the use of a secondary application like a spreadsheet. Summary definition shall allow up to seven user defined columns describing attributes to be displayed including custom column labels. Up to 100 rows per summary shall be supported. Summary viewing shall be available over the network using a standard Web browser.

- .5 Reports shall be selectable by date, time, area and device. Each report shall include a color visual summary of essential energy information.

- .5 Schedules

- .1 A graphical display for time-of-day scheduling and override scheduling of building operations shall be provided. At a minimum, the following functions shall be provided:

- .1 Weekly schedules
- .2 Exception Schedules
- .3 Monthly calendars

- .2 Weekly schedules shall be provided for each group of equipment with a specific time use schedule.
  - .3 It shall be possible to define one or more exception schedules for each schedule including references to calendars.
  - .4 Monthly calendars shall be provided that allow for simplified scheduling of holidays and special days for a minimum of five years in advance. Holidays and special days shall be user-selected with the pointing device or keyboard, and shall automatically reschedule equipment operation as previously defined on the exception schedules.
  - .5 Changes to schedules made from the User Interface shall directly modify the network automation engine schedule database.
  - .6 Schedules and calendars shall comply with ASHRAE Standard 135 BACnet Standard.
  - .7 The calendar object supports an option to add a reference to another calendar object that is designated to be the master for the facility. Any Supervisory and BAC calendars can be configured to reference a single master global calendar. Changes to the master global calendar are automatically synced with all calendars that are referenced.
  - .8 Selection of a single menu item or tool bar button shall print any displayed schedule on the system printer for use as a building management and diagnostics tool.
  - .9 Software shall be provided to configure and implement optimal start and stop programming based on existing indoor and outdoor environmental conditions as well as equipment operating history.
  - .10 The system solar clock shall support the scheduling and energy management functions. The solar clock will calculate the sunrise, sunset, and sun angle values for a specified latitude and longitude. A time offset can also be specified. An example would be to use the solar clock object as a master to an interlock to turn lights on 30 minutes after sunset and off 30 minutes before sunrise.
- .6 Security/Passwords
- .1 Multiple-level passwords access protection shall be provided via roles and permissions. The feature will allow the system to base access on a user's job title or role and allow the user/manager access interface control, display, and database manipulation capabilities based on an assigned password.

- .2 Roles may be copied and altered to meet specific roles and permissions based on the particular policies.
- .3 Each user shall have the following: A user account name, a complex password or passphrase, other user account policies (such as session timeout), timesheet access based on day of the week and time of day, and specific user view.
- .4 The system shall allow each user to change his or her password at will.
- .5 When entering or editing passwords, the system shall not echo the actual characters for display on the monitor.
- .6 A maximum of 150 categories may be used to determine or assign areas of responsibilities to each user account. A maximum of 13 (of the 150) named categories which are specifics such as "No Access, View, Advanced Review, Operate, Intervene, Diagnostic, Manage Item Events, Manage Every, and Configure Items".
- .7 A minimum of 100 unique passwords shall be supported.
- .8 Operators shall be able to perform only those commands available for their respective passwords. Display of menu selections shall be limited to only those items defined for the access level of the password used to log-on.
- .9 Operators shall be further limited to only access, command, and modify those buildings, systems, and subsystems for which they have responsibility. Provide a minimum of 100 categories of systems to which individual operators may be assigned.
- .10 The system shall automatically generate a report of log-on/log-off and system activity for each user. Any action that results in a change in the operation or configuration of the control system shall be recorded, including: modification of point values, schedules or history collection parameters, and all changes to the alarm management system, including the acknowledgment and deletion of alarms.
- .11 After successful login to the Site Management Portal (SMP) the last time and date that user name was previously logged in is shown on the screen.
- .12 Each login attempt is recorded in the system Audit Log with the option to record the IP address of the PC that made the login.
- .7 Screen Manager
  - .1 The system shall allow a customized image on the login screen (i.e. organization name, logo).

- .2 User View navigations can be displayed as either a set of tabs or a drop down list.
- .3 Allows user preference for assigning of a background color for when an object is Out of Service which will enable the operator to quickly distinguish points that have been commanded to this state.
- .4 The user interface shall be provided with screen management capabilities that allow the user to activate, close, and simultaneously manipulate a minimum of 4 active display windows plus a network or user defined navigation tree.
- .8 **Dynamic Color Graphics**
  - .1 The graphics application program shall be supplied as an integral part of the user interface. Browser or Workstation applications that rely only upon HTML pages shall not be acceptable.
  - .2 The graphics applications shall include a create/edit function and a runtime function. The system architecture shall support an unlimited number of graphics documents (graphic definition files) to be generated and executed. The graphics shall be able to display and provide animation based on real-time data that is acquired, derived, or entered.
  - .3 Graphics runtime functions: A maximum of 16 graphic applications shall be able to execute at any one time on a user interface or workstation with 4 visible to the user. Each graphic application shall be capable of the following functions:
    - .1 All graphics shall be fully scalable
    - .2 The graphics shall support a maintained aspect ratio.
    - .3 Multiple fonts shall be supported.
    - .4 Unique background shall be assignable on a per graphic basis.
    - .5 The color of all animations and values on displays shall indicate the status of the object attribute.
    - .6 Graphics that represent buildings or systems shall allow natural links and transitions between related detailed tabular views of data that compliment the graphic.
  - .4 Operation from graphics: It shall be possible to change values (setpoints) and states in system controlled equipment directly from the graphic.

- .5 Floor Plan graphics: The user interface shall provide graphic applications that summarize conditions on a floor. Floor plan graphics shall indicate thermal comfort using dynamic colors to represent zone temperature deviations from zone setpoint(s). Floor plan graphics shall display overall metrics for each zone in the floor.
- .6 Aliasing – Many graphic displays representing part of a building and various building components are exact duplicates, with the exception that the various variables are bound to different field values. Consequently, it shall be possible to bind the value of a graphic display to aliases, as opposed to the physical field tags.
- .7 Graphic editing tool – A graphic editing tool shall be provided that allows for the creation and editing of graphic files. The graphic editor shall be capable of performing/defining all animations, and defining all runtime binding.
  - .1 The graphic editing tool shall provide a library of standard HVAC equipment, floor plan, lighting, security and network symbols.
  - .2 The graphic editing tool shall provide for the creation and positioning of library symbols by dragging from tool bars or drop-downs and positioning where required.
  - .3 The graphics editing tool shall permit the importing of AutoCAD drawings for use in the system.
  - .4 The graphic editing tool shall be able to add additional content to any graphic by importing images in the SVG, PNG or JPG file formats.
- .9 Historical trending and data collection
  - .1 Each Automation Engine shall store trend and point history data for all analog and digital inputs and outputs, as follows:
    - .1 Any point, physical or calculated, may be designated for trending. Two methods of collection shall be allowed:
      - 1. Defined time interval
      - 2. Upon a change of value
    - .2 Each Automation Engine shall have the capability to store multiple samples for each physical point and software variable based upon available memory, including an individual sample time/date stamp. Points may be assigned to multiple history trends with different collection parameters.

- .2 Trend and change of value data shall be stored within the engine and uploaded to a dedicated trend database or exported in a selectable data format via a provided data export utility. Uploads to a dedicated database shall occur based upon one of the following: user-defined interval, manual command, or when the trend buffers are full. Exports shall be as requested by the user or on a time scheduled basis.
- .3 The system shall provide a configurable data storage subsystem for the collection of historical data. Data can be stored in SQL database format.
- .4 The system shall provide data to enable optimization capabilities including fault detection and diagnostics, advanced analytics and central plant optimization without the need of a gateway or additional hardware.
- .10 Trend data viewing and analysis
  - .1 Provide a trend viewing utility that shall have access to all database points.
  - .2 It shall be possible to retrieve any historical database point for use in displays and reports by specifying the point name and associated trend name.
  - .3 The trend viewing utility shall have the capability to define trend study displays to include multiple trends.
  - .4 Displays shall be able to be single or stacked graphs with on-line selectable display characteristics, such as ranging, color, and plot style.
  - .5 Display magnitude and units shall both be selectable by the operator at any time without reconfiguring the processing or collection of data. This is a zoom capability.
  - .6 Display magnitude shall automatically be scaled to show full graphic resolution of the data being displayed.
  - .7 The Display shall support the user's ability to change colors, sample sizes, and types of markers.
- .11 Database Management
  - .1 Where a separate SQL database is utilized for information storage the System shall provide a Database Manager that separates the database monitoring and managing functions by supporting two separate windows.
  - .2 Database secure access shall be accomplished using standard SQL authentication including the ability to access data for use outside of the Building Automation application.

- .3 The database managing function shall include summarized information on trend, alarm, event, and audit for the following database management actions:
  - .1 Backup
  - .2 Purge
  - .3 Restore
- .4 The Database Manager shall support four tabs:
  - .1 Statistics – shall display Database Server information and Trend, Alarm (Event), and Audit information on the Metasys Databases.
  - .2 Maintenance – shall provide an easy method of purging records from the Metasys Server trend, alarm (event), and audit databases by supporting separate screens for creating a backup prior to purging, selecting the database, and allowing for the retention of a selected number of day's data.
  - .3 Backup – Shall provide the means to create a database backup file and select a storage location.
  - .4 Restore – shall provide a restricted means of restoring a database by requiring the user to log into an Expert Mode in order to view the Restore screen.
- .5 The Status Bar shall appear at the bottom of all Database Manager Tabs and shall provide information on the current database activity. The following icons shall be provided:
  - .1 Ready
  - .2 Purging Record from a database
  - .3 Action Failed
  - .4 Refreshing Statistics
  - .5 Restoring database
  - .6 Shrinking a database
  - .7 Backing up a database
  - .8 Resetting internet information Services
  - .9 Starting the Device Manager
  - .10 Shutting down the Device Manager
  - .11 Action successful

- .6 The Database Manager monitoring functions shall be accessed through the Monitoring Settings window and shall continuously read database information once the user has logged in.
- .7 The System shall provide user notification via taskbar icons and e-mail messages when a database value has exceeded a warning or alarm limit.
- .8 The Monitoring Settings window shall have the following sections:
  - .1 General – Shall allow the user to set and review scan intervals and start times.
  - .2 Email – Shall allow the user to create and review e-mail and phone text messages to be delivered when a Warning or Alarm is generated.
  - .3 Warning – shall allow the user to define the Warning limit parameters, set the Reminder Frequency, and link the e-mail message.
  - .4 Alarm – shall allow the user to define the Alarm limit parameters, set the Reminder Frequency, and link the e-mail message.
  - .5 Database login – Shall protect the system from unauthorized database manipulation by creating a Read Access and a Write Access for each of the Trend, Alarm (Event) and Audit databases as well as an Expert Mode required to restore a database.
- .9 The Monitoring Settings Taskbar shall provide the following informational icons:
  - .1 Normal – Indicates by color and size that all databases are within their limits.
  - .2 Warning - Indicates by color and size that one or more databases have exceeded their Warning limit.
  - .3 Alarm - Indicates by color and size that one or more databases have exceeded their Alarm limit.
- .10 The System shall provide user notification via Taskbar icons and e-mail messages when a database value has exceeded a warning or alarm limit.
- .12 Demand Limiting and Load Rolling
  - .1 The System shall provide a Demand Limiting and Load Rolling program for the purpose of limiting peak energy usage and reducing overall energy consumption.

- .2 The System shall support both Sliding Window and Fixed Window methods of predicting demand.
- .3 The System shall support three levels of sensitivity in the Sliding Window demand calculations for fine tuning the system.
  - .1 Low Setting – Sheds loads later and over the shortest amount of time. Maximizes the time the equipment is on.
  - .2 Medium Setting – Sheds loads earlier over a longer amount of time than the Low Setting. Increases the time the equipment is on and decreases the probability of exceeding the Tariff Target over the Low Setting.
  - .3 High Setting – Sheds loads earlier over a longer amount of time than the Medium Setting. Minimizes the probability of exceeding the Tariff Target.
- .4 The System shall have both a Shed Mode and a Monitor Only Mode of operation.
  - .1 When the Shed Mode is engaged, the System shall actively control the Demand.
  - .2 When the Monitor Mode is engaged, the System will simulate the shedding action but will not take any action.
- .5 The Demand Limiting program shall monitor the energy consumption rate and compare it to a user defined Tariff Target. The system shall maintain consumption below the target by selectively shedding loads based upon a user defined strategy.
- .6 The Demand Limiting program shall be capable of supporting a minimum of 10 separate Load Priorities. Each load shall be user assigned to a Load Priority.
- .7 The Demand Limiting program shall be capable of supporting a minimum of 12 separate Tariff Targets defining the maximum allowed average power during the current interval.
- .8 The System shall support a Maximum Shed Time for each load as determined by the user. The system shall restore the load before the Maximum Shed time has expired.
- .9 The System shall support a Minimum Shed Time for each load as determined by the user. The system shall not restore the load sooner than the Minimum Shed Time has expired.
- .10 The System shall support a Minimum Release Time for each load as determined by the user. The System shall

not shed the load until it has been off for the Minimum Release time.

- .11 The System shall support three user defined options if the meter goes unreliable.
  - .1 Shedding – The currently shed loads will be released as their Maximum shed Times expire.
  - .2 Maintain the Current Shed Rate – The System will use the Demand Limiting shed rate that was present when the meter went unreliable.
  - .3 Use Unreliable Meter Shed Rate – the system will control to a user defined Unreliable Shed Rate target.
- .12 The Load Rolling program shall sum the loads currently shed and compare it to a user defined Load Rolling Target. The system shall maintain consumption below the target by selectively shedding loads based upon a user defined Load Priority.
- .13 The Load Rolling program shall be capable of supporting a minimum of 10 separate Load Priorities. Each load shall be user assigned to a Load Priority.
- .14 The Load Rolling program shall be capable of supporting a minimum of 12 separate Tariff Targets defining the amount of power by which the demand must be reduced.
- .15 The System shall provide the user with a Load Tab that displays all of the Demand Limiting and Load Rolling parameters for any selected load.
- .16 The System shall provide the user with a Load Summary that displays all of the loads associated with the Demand Limiting and Load Rolling programs. Status Icons for each load shall indicate:
  - .1 Load is Offline
  - .2 Load is Disabled
  - .3 Load is Shed
  - .4 Load is Locked
  - .5 Load is in Comfort Override
- .17 The Load Summary shall include a Load Summary Runtime view listing the following load conditions:
  - .1 Load Priority
  - .2 Shed Strategy
  - .3 Load Rating
  - .4 Present Value

- .5 Ineligibility Status
  - .6 Active Timer
  - .7 Time Remaining
  - .8 Last Shed Time
- .4 System User Interface
- .1 BMS Contractor shall provide and install all computer hardware and software required for the purpose of configuration and consolidation of information and programs required for the delivery of a Task Focused, Web Based Portal to the BMS. The system User Interface shall provide a natural, complementary extension to the site management user interface previously described.
  - .2 The user interface architecture shall be implemented to conform to industry standards, so that it can accommodate the required applications provided by the BMS Contractor as well as communicate information to and from any size control system.
  - .3 The exact same user interface shall be accessible from any type of personal computer or mobile device running any type of operating system (ex. iOS, Android, Windows).
  - .4 The interface shall automatically adapt and optimize the information displayed to fit the screen size of the client device and shall also be touch friendly.
  - .5 The user interface shall organize and display information using customer specific locations and spaces. At a minimum, the user interface shall provide:
    - .1 Organization of all space, equipment and point information in a familiar way, reducing the need for extensive training prior to use.
    - .2 A navigation mechanism for users to select the specific location or space to display information for – only spaces and locations in the navigation tree, nothing more.
    - .3 The ability to search for and/or bookmark any location or space by name for quick access to critical or troublesome areas.
    - .4 The same navigation mechanisms apply across any client device (ex. Smart phone, tablet, personal computer) for consistency and ease of use.
  - .6 Plug-ins and special native app software (ex. Downloaded and installed from an app store) shall not be required to conduct daily operations of buildings and equipment.
  - .7 The user interface shall clearly display equipment relationships without custom graphic generation.

- .8 The user interface shall provide a single display of all potential issues in a facility including items currently in alarm, warning, override, out-of-service and offline.
- .9 The user interface shall provide a single display of all activity related to a specific piece of equipment including user changes, discarded user changes, pending alarms, discarded alarms and acknowledged alarms.
- .10 The user interface shall provide support for up to 100 concurrent users from an unlimited number of individuals with defined password access to the system.
- .11 Provide the capability to view, command and modify large quantities of similar data in tailored summaries without the use of a secondary application, like a spreadsheet. These summaries shall be automatically generated or user defined. User defined summaries shall allow up to seven user defined columns describing attributes to be displayed including custom column labels. Up to 100 rows per summary shall be supported.
- .12 Operator Interface
  - .1 Password access shall be as described previously for management portal UI
  - .2 Once logged in, the System shall display a pre-selected screen tailored to the task requirements of the individual user.
  - .3 The User Interface shall utilize an intuitive navigation and display method designed for operators who access the system for casual information and control or on an infrequent basis. It shall feature three basic components.
    - .1 Radio buttons for selection of the type of information to be displayed including Alerts, Summary, Schedules and Diagnostics
    - .2 Navigation tree for selection of the specific data to be displayed on screen for the selected type. The navigation tree may be hidden and expanded by the operator to optimize the display of information
    - .3 A display window that provides the selected information by type in a pre-configured tabular format
  - .4 The user interface software shall provide help menus and instructions for each operation and/or application.
  - .5 The system shall provide support for up to 100 concurrent users from an unlimited universe individuals with defined password access to the system
  - .6 The system shall utilize Secure Sockets Level (SSL) support as required to allow the ready access portal to

communicate across a network in a way designed to prevent eavesdropping, tampering, and message forgery. It provides endpoint authentication and communications privacy over the network using cryptography

- .7 The system shall have the capability to display multiple navigation trees that correspond to the user views configured in the management portal UI.
- .8 The alert summary of the ready access portal shall, at the minimum, provide the following information
  - .1 Alert (Alarm) type
  - .2 Date and time of alert occurrence
  - .3 Priority (color coded to level)
  - .4 Item name.
  - .5 Item value (if applicable)
  - .6 Message
  - .7 Any attribute of any object in the system may be designated to report an alarm
- .9 A standard summary on the ready access portal shall, at the minimum, provide the following information
  - .1 Point type graphic icon
  - .2 Item name
  - .3 Item value
  - .4 Item status
  - .5 Access to the change value window (if applicable) for the purpose of setting, holding or releasing an item value
- .10 A custom summary on the ready access portal shall display user-specified summaries of key data sets that can be quickly filtered and sorted. Items within these custom summaries can be commanded.
- .11 A graphic view on the ready access portal shall display as described previously for management portal UI.
- .12 The schedule detail summary of the ready access portal shall, at the minimum, provide the following information
  - .1 Scheduled occurrences including time and value
  - .2 Scheduled overrides including start time, end time and value
  - .3 A list of all scheduled items including name and attribute, value, status and priority

- .4 Access to the Add Temporary Override window for the purpose of adding a temporary override to the schedule
- .13** The diagnostic (trend) summary of the ready access portal as viewed on a personal computing device shall provide the following information.
- .1 Item name
- .2 Item status
- .3 Trend name
- .4 Trend status
- .5 Full path name
- .6 Access to trend detail summary including trended value, time and date arranged in a user selectable format of 1 hour, 12 hours, 24 hours, 48 hours or 72 hours
- .4 Network Automation Engines (NAE)**
- .1 Network Automation Engine
- .1 The Network Automation Engine (NAE) shall be a fully user-programmable, supervisory controller. The NAE shall monitor the network of distributed application-specific controllers, provide global strategy and direction, and communicate on a peer-to-peer basis with other Network Automation Engines.
- .2 Automation network: The NAE shall reside on the automation network and shall support a subnet of system controllers.
- .3 User interface: Each NAE shall have the ability to deliver a web based User Interface (UI) as previously described. All computers connected physically or virtually to the automation network shall have access to the web based UI.
- .1 The web based UI software shall be imbedded in the NAE. Systems that require a local copy of the system database on the user's personal computer are not acceptable.
- .2 The NAE shall support a minimum of two (2) concurrent users.
- .3 The web based user shall have the capability to access all system data through one NAE.
- .4 Remote users connected to the network through an Internet Service Provider (ISP) or telephone dial up shall also have total system access through one NAE.
- .5 Systems that require the user to address more than one NAE to access all system information are not acceptable.
- .6 The NAE shall have the capability of generating web based UI graphics. The graphics capability shall be imbedded in the NAE.

- .7 Systems that support UI Graphics from a central database or require the graphics to reside on the user's personal computer are not acceptable.
- .8 The web based UI shall support the following functions using a standard version of Microsoft Internet Explorer and/or other web browser:
  - .1 Configuration
  - .2 Commissioning
  - .3 Data Archiving
  - .4 Monitoring
  - .5 Commanding
  - .6 System Diagnostics
- .9 Systems that require workstation software or modified web browsers are not acceptable.
- .10 The NAE shall allow temporary use of portable devices without interrupting the normal operation of permanently connected modems.
- .4 Processor – The NAE shall be microprocessor-based with a minimum word size of 32 bits. The NAE shall be a multi-tasking, multi-user, and real-time digital control processor. Standard operating systems shall be employed. NAE size and capability shall be sufficient to fully meet the requirements of this Specification.
- .5 Memory – Each NAE shall have sufficient memory to support its own operating system, databases, and control programs, and to provide supervisory control for all control level devices.
- .6 Hardware Real Time Clock – The NAE shall include an integrated, hardware-Based, real-time clock.
- .7 The NAE shall include troubleshooting LED indicators to identify the following conditions:
  - .1 Power - On/Off
  - .2 Ethernet Traffic – Ethernet Traffic/No Ethernet Traffic
  - .3 Ethernet Connection Speed – 10 Mbps/100 Mbps
  - .4 Field Communication (FC) Bus – Normal Communications/No Field Communications
  - .5 Peer Communication – Data Traffic between NAE Devices
  - .6 Run – NAE Running/NAE in Startup/NAE Shutting Down/Software Not Running
  - .7 Bat Fault – Battery Defective, Data Protection Battery Not Installed
  - .8 Fault – General Fault

- .8 Communications Ports – The NAE shall provide the following ports for operation of operator Input/Output (I/O) devices, such as industry-standard computers, modems, and portable operator's terminals.
  - .1 USB port
  - .2 RS-232 serial data communication port
  - .3 RS-485 port
  - .4 Ethernet port
- .9 Diagnostics – The NAE shall continuously perform self-diagnostics, communication diagnosis, and diagnosis of all panel components. The Network Automation Engine shall provide both local and remote annunciation of any detected component failures, low battery conditions, or repeated failures to establish communication.
- .10 Power Failure – In the event of the loss of normal power, The NAE shall continue to operate for a user adjustable period of up to 10 minutes after which there shall be an orderly shutdown of all programs to prevent the loss of database or operating system software.
  - .1 During a loss of normal power, the control sequences shall go to the normal system shutdown conditions. All critical configuration data shall be saved into Flash memory.
  - .2 Upon restoration of normal power and after a minimum off-time delay, the controller shall automatically resume full operation without manual intervention through a normal soft-start sequence.
- .11 Certification – The NAE shall be listed by Underwriters Laboratories (UL).
- .12 Controller network – The NAE shall support the following communication protocols as a minimum on the controller network:
  - .1 The NAE shall support BACnet Standard MS/TP Bus Protocol ASHRAE SSPC-135, Clause 9 on the controller network.
    - .1 The NAE shall be BACnet Testing Labs (BTL) certified and carry the BTL Label.
    - .2 The NAE shall be tested and certified as a BACnet Building Controller (B-BC).
    - .3 A BACnet Protocol Implementation Conformance Statement shall be provided for the NAE.
    - .4 The Conformance Statements shall be submitted 10 days prior to bidding.
    - .5 The NAE shall support a minimum of 50 control devices.
  - .2 The NAE shall support LonWorks enabled devices using the Free Topology Transceiver FTT10.
    - .1 All LonWorks controls devices shall be LonMark certified.

- .2 The NAE shall support a minimum of 64 LonWorks enabled control devices.
- .5 Network Control Engine (Building Controller Unit (BCU))
  - .1 The Network Control Engine (NCE) shall be a fully user-programmable, supervisory controller. The NCE shall monitor the network of distributed application-specific controllers, provide global strategy and direction, and communicate on a peer-to-peer basis with other Network Control Engines.
  - .2 The Network Control Engine (NCE) shall be a fully user-programmable, digital controller that includes a minimum of 33 I/O points.
  - .3 Automation Network – The NCE shall reside on the automation network and shall support a subnet of 32 Field controllers.
  - .4 User Interface – Each NCE shall have the ability to deliver a web based User Interface (UI) as previously described. All computers connected physically or virtually to the automation network shall have access to the web based UI.
    - .1 The web based UI software shall be imbedded in the NCE. Systems that require a local copy of the system database on the user's personal computer are not acceptable.
    - .2 The NCE shall support a minimum of two (2) concurrent users.
    - .3 The NCE shall have the capability of generating web based UI graphics. The graphics capability shall be imbedded in the NCE.
    - .4 Systems that support UI Graphics from a central database or require the graphics to reside on the user's personal computer are not acceptable.
    - .5 The web based UI shall support the following functions using a standard version of Microsoft Internet Explorer and/or other web browser:
      - .1 Configuration
      - .2 Commissioning
      - .3 Data Archiving
      - .4 Monitoring
      - .5 Commanding
      - .6 System Diagnostics
    - .6 Systems that require workstation software or modified web browsers are not acceptable.
    - .7 The NCE shall allow temporary use of portable devices without interrupting the normal operation of permanently connected modems.
  - .5 The NCE shall employ a finite state control engine to eliminate unnecessary conflicts between control functions at crossover points in their operational sequences. Suppliers using non-state based DDC shall provide separate control strategy diagrams for all controlled functions in their submittals.

- .6 The NCE shall be factory programmed with a continuous adaptive tuning algorithm that senses changes in the physical environment and continually adjusts loop tuning parameters appropriately. Controllers that require manual tuning of loops or perform automatic tuning on command only, shall not be acceptable.
- .7 The NCE shall be assembled in a plenum-rated plastic housing with flammability rated to UL94-5VB.
- .8 The NCE shall support the following minimum number and types of inputs and outputs:
  - .1 Ten Universal Inputs - shall be configured to monitor any of the following:
    - .1 Analog Input, Voltage Mode
    - .2 Analog Input, Current Mode
    - .3 Analog Input, Resistive Mode
    - .4 Binary Input, Dry Contact Maintained Mode
    - .5 Binary Input, Pulse Counter Mode
  - .2 Eight Binary Inputs - shall be configured to monitor either of the following:
    - .1 Dry Contact Maintained Mode
    - .2 Pulse Counter Mode
  - .3 Four Analog Outputs - shall be configured to output either of the following:
    - .1 Analog Output, Voltage Mode
    - .2 Analog Output, Current Mode
  - .4 Seven Binary Outputs - shall output the following:
    - .1 24 VAC Triac
  - .5 Four Configurable Outputs - shall be configured to output either of the following:
    - .1 Analog Output, Voltage Mode
    - .2 Binary Output, 24 VAC Triac Mode
- .9 The NCE shall have the ability to monitor and control a network of sensors and actuators over a Sensor-Actuator Bus (SA Bus).
  - .1 The SA Bus shall be a Master-Slave/Token-Passing (MS/TP) Bus supporting BACnet Standard protocol SSPC-135, Clause 9.
  - .2 The SA Bus shall support a minimum of 10 devices.
  - .3 The SA Bus shall operate at a maximum distance of 360 metres between the NCE and the furthest connected device.

- .10 The NCE shall have the capability to execute complex control sequences involving direct wired I/O points as well as input and output devices communicating over the Field Trunk or the SA Bus.
- .11 The NCE shall support, but not be limited to, the following applications:
  - .1 Central Equipment including chillers and boilers
  - .2 Lighting and electrical distribution
  - .3 Built-up air handling units for special applications
  - .4 Power generation and energy monitoring equipment
  - .5 Interfaces to security and fire detection systems
- .12 The NCE shall be microprocessor-based with a minimum word size of 32 bits. The NCE shall be a multi-tasking, multi-user, and real-time digital control processor. Standard operating systems shall be employed. NCE size and capability shall be sufficient to fully meet the requirements of this Specification.
- .13 The NCE shall employ an industrial single board computer.
- .14 Each NCE shall have sufficient memory to support its own operating system, databases, and control programs, and to provide supervisory control for all control level devices.
- .15 The NCE shall include an integrated, hardware-based, real-time clock.
- .16 The NCE shall employ nonvolatile Flash memory to store all programs and data. The NCE shall employ a data protection battery to save data and power the real time clock when primary power is interrupted.
- .17 The NCE shall provide removable, color coded, screw terminal blocks for 24 VAC power, communication bus and I/O point field wiring.
- .18 The NCE shall include troubleshooting LED indicators to identify the following conditions:
  - .1 Power
  - .2 Fault
  - .3 SA Bus
  - .4 FC Bus
  - .5 Battery Fault
  - .6 Ethernet
  - .7 10 LNK
  - .8 100 LNK
  - .9 Run
  - .10 Peer Com

- .19 Communications Ports: The NCE shall provide the following ports for operation of operator Input/Output (I/O) devices, such as industry-standard computers, modems, and portable operator's terminals.
  - .1 USB port
  - .2 RS-232 serial data communication port
  - .3 RS-485 port
  - .4 RJ-45 Ethernet port
  - .5 RJ-12 jack
- .20 Diagnostics: The NCE shall continuously perform self-diagnostics, communication diagnosis, and diagnosis of all panel components. The Network Control Engine shall provide both local and remote annunciation of any detected component failures, low battery conditions, or repeated failures to establish communication.
- .21 Power Failure: In the event of the loss of normal power, The NCE shall continue to operate for a user adjustable period of up to 10 minutes after which there shall be an orderly shutdown of all programs to prevent the loss of database or operating system software.
  - .1 During a loss of normal power, the control sequences shall go to the normal system shutdown conditions. All critical configuration data shall be saved into Flash memory.
  - .2 Upon restoration of normal power and after a minimum off-time delay, the controller shall automatically resume full operation without manual intervention through a normal soft-start sequence.
- .22 Certification: The NCE shall be listed by Underwriters Laboratories (UL). UL 916, Energy Management Equipment. FCC Compliant to CFR47, Part 15, Subpart B, Class A
- .23 Field Controller Bus: The NCE shall support the following communication protocols on the Field Controller Bus:
  - .1 The NCE shall support BACnet Standard MS/TP Bus Protocol ASHRAE SSPC-135, Clause 9 on the controller network.
    - .1 The NCE shall be BACnet Testing Labs (BTL) certified and carry the BTL Label.
    - .2 The NCE shall be tested and certified as a BACnet Building Controller (B-BC).
    - .3 A BACnet Protocol Implementation Conformance Statement shall be provided for the NCE.
    - .4 The Conformance Statements shall be submitted 10 days prior to bidding.
    - .5 The NCE shall support a minimum of 32 control devices.
  - .2 The NCE shall support LonWorks enabled devices using the Free Topology Transceiver FTT10 on the Field Controller Bus (LonWorks Network).

- .1 All LonWorks controls devices shall be LonMark certified.
    - .2 The NCE shall support a minimum of 32 LonWorks enabled control devices.
- .6 DDC System Controllers
  - .1 Advanced Application Field Equipment Controller (FAC) / Equipment Controller Unit (ECU)
    - .1 The Advanced Application Field Equipment Controller (FAC) shall be a fully user-programmable, digital controller that communicates via BACnet MS/TP protocol or optionally via N2Open.
      - .1 The FAC shall support BACnet Standard MS/TP Bus Protocol ASHRAE SSPC-135, Clause 9 on the controller network.
        - .1 The FAC shall be BACnet Testing Labs (BTL) certified and carry the BTL Label.
        - .2 The FAC shall be tested and certified as a BACnet Application Specific Controller (B-ASC).
        - .3 A BACnet Protocol Implementation Conformance Statement shall be provided for the FAC.
        - .4 The Conformance Statement shall be submitted 10 days prior to bidding.
    - .2 The FAC shall employ a finite state control engine to eliminate unnecessary conflicts between control functions at crossover points in their operational sequences. Suppliers using non-state based DDC shall provide separate control strategy diagrams for all controlled functions in their submittals.
    - .3 Controllers shall be factory programmed with a continuous adaptive tuning algorithm that senses changes in the physical environment and continually adjusts loop tuning parameters appropriately. Controllers that require manual tuning of loops or perform automatic tuning on command only shall not be acceptable. The FAC shall be assembled in a plenum-rated plastic housing with flammability rated to UL94-5VB.
    - .4 The FAC shall include an integral real-time clock and support time-based tasks which enables these field controllers to monitor and control:
      - .1 Schedules
      - .2 Calendars
      - .3 Alarms
      - .4 Trends
    - .5 The FAC can continue time-based monitoring when offline for extended periods of time from the system network.
    - .6 The FAC can operate as a stand-alone controller in applications that do not require a networked supervisory device or for network applications where it is preferred to have the scheduling, alarming, and/or trending performed locally in the field controllers.

- .7 The FAC shall include troubleshooting LED indicators to identify the following conditions:
  - .1 Power On
  - .2 Power Off
  - .3 Download or Startup in progress, not ready for normal operation
  - .4 No Faults
  - .5 Device Fault
  - .6 Field Controller Bus - Normal Data Transmission
  - .7 Field Controller Bus - No Data Transmission
  - .8 Field Controller Bus - No Communication
  - .9 Sensor-Actuator Bus - Normal Data Transmission
  - .10 Sensor-Actuator Bus - No Data Transmission
  - .11 Sensor-Actuator Bus - No Communication
- .8 The FAC shall accommodate the direct wiring of analog and binary I/O field points.
- .9 The FAC shall support the following types of inputs and outputs:
  - .1 Universal Inputs - shall be configured to monitor any of the following:
    - .1 Analog Input, Voltage Mode
    - .2 Analog Input, Current Mode
    - .3 Analog Input, Resistive Mode
    - .4 Binary Input, Dry Contact Maintained Mode
    - .5 Binary Input, Pulse Counter Mode
  - .2 Binary Inputs - shall be configured to monitor either of the following:
    - .1 Dry Contact Maintained Mode
    - .2 Pulse Counter Mode
  - .3 Analog Outputs - shall be configured to output either of the following
    - .1 Analog Output, Voltage Mode
    - .2 Analog Output, Current Mode
  - .4 Binary Outputs - shall output the following:
    - .1 Line-voltage relay outputs
  - .5 24 VAC Triac
  - .6 Configurable Outputs - shall be capable of the following:
    - .1 Analog Output, Voltage Mode

.2 Binary Output Mode

- .10 The FAC shall have the ability to reside on a Field Controller Bus (FC Bus).
  - .1 The FC Bus shall be a Master-Slave/Token-Passing (MS/TP) Bus supporting BACnet Standard protocol SSPC-135, Clause 9.
  - .2 The FC Bus shall support communications between the FACs and the NAE.
  - .3 The FC Bus shall also support Input/Output Module (IOM) communications with the FAC and with the NAE.
  - .4 The FC Bus shall support a minimum of 100 IOMs and FACs in any combination.
  - .5 The FC Bus shall operate at a maximum distance of 4500 metres. between the FAC and the furthest connected device.
- .11 The FAC shall have the ability to monitor and control a network of sensors and actuators over a Sensor-Actuator Bus (SA Bus).
  - .1 The SA Bus shall be a Master-Slave/Token-Passing (MS/TP) Bus supporting BACnet Standard Protocol SSPC-135, Clause 9.
  - .2 The SA Bus shall support a minimum of 10 devices per trunk.
  - .3 The SA Bus shall operate at a maximum distance of 360 metres. between the FAC and the furthest connected device.
- .12 The FAC shall have the capability to execute complex control sequences involving direct wired I/O points as well as input and output devices communicating over the FC Bus or the SA Bus.
- .13 The FAC shall support, but not be limited to, the following applications:
  - .1 Chiller plant applications
  - .2 Heating central plant applications
  - .3 Built-up air handling units for special applications
  - .4 Terminal & package units
  - .5 Special programs as required for systems control

.7 Field Equipment Controller (FEC) / Equipment Controller Unit (ECU)

- .1 The Field Equipment Controller (FEC) shall be a fully user-programmable, digital controller that communicates via BACnet MS/TP protocol or optionally via N2Open.
  - .1 The FEC shall support BACnet Standard MS/TP Bus Protocol ASHRAE SSPC-135, Clause 9 on the controller network.
    - .1 The FEC shall be BACnet Testing Labs (BTL) certified and carry the BTL Label.
    - .2 The FEC shall be tested and certified as a BACnet Application Specific Controller (B-ASC).

- .3 A BACnet Protocol Implementation Conformance Statement shall be provided for the FEC.
- .4 The Conformance Statement shall be submitted 10 days prior to bidding.
- .2 The FEC shall employ a finite state control engine to eliminate unnecessary conflicts between control functions at crossover points in their operational sequences. Suppliers using non-state based DDC shall provide separate control strategy diagrams for all controlled functions in their submittals.
- .3 Controllers shall be factory programmed with a continuous adaptive tuning algorithm that senses changes in the physical environment and continually adjusts loop tuning parameters appropriately. Controllers that require manual tuning of loops or perform automatic tuning on command only shall not be acceptable. The FEC shall be assembled in a plenum-rated plastic housing with flammability rated to UL94-5VB.
- .4 The FEC shall include troubleshooting LED indicators to identify the following conditions:
  - .1 Power On
  - .2 Power Off
  - .3 Download or Startup in progress, not ready for normal operation
  - .4 No Faults
  - .5 Device Fault
  - .6 Field Controller Bus - Normal Data Transmission
  - .7 Field Controller Bus - No Data Transmission
  - .8 Field Controller Bus - No Communication
  - .9 Sensor-Actuator Bus - Normal Data Transmission
  - .10 Sensor-Actuator Bus - No Data Transmission
  - .11 Sensor-Actuator Bus - No Communication
- .5 The FEC shall accommodate the direct wiring of analog and binary I/O field points.
- .6 The FEC shall support the following types of inputs and outputs:
  - .1 Universal Inputs - shall be configured to monitor any of the following:
    - .1 Analog Input, Voltage Mode
    - .2 Analog Input, Current Mode
    - .3 Analog Input, Resistive Mode
    - .4 Binary Input, Dry Contact Maintained Mode
    - .5 Binary Input, Pulse Counter Mode
  - .2 Binary Inputs - shall be configured to monitor either of the following:

- .1 Dry Contact Maintained Mode
    - .2 Pulse Counter Mode
  - .3 Analog Outputs - shall be configured to output either of the following
    - .1 Analog Output, Voltage Mode
    - .2 Analog Output, current Mode
  - .4 Binary Outputs - shall output the following:
    - .1 24 VAC Triac
  - .5 Configurable Outputs - shall be capable of the following:
    - .1 Analog Output, Voltage Mode
    - .2 Binary Output Mode
- .7 The FEC shall have the ability to reside on a Field Controller Bus (FC Bus).
  - .1 The FC Bus shall be a Master-Slave/Token-Passing (MS/TP) Bus supporting BACnet Standard protocol SSPC-135, Clause 9.
  - .2 The FC Bus shall support communications between the FECs and the NAE.
  - .3 The FC Bus shall also support Input/Output Module (IOM) communications with the FEC and with the NAE.
  - .4 The FC Bus shall support a minimum of 100 IOMs and FECs in any combination.
  - .5 The FC Bus shall operate at a maximum distance of 4500 metres between the FEC and the furthest connected device.
- .8 The FEC shall have the ability to monitor and control a network of sensors and actuators over a Sensor-Actuator Bus (SA Bus).
  - .1 The SA Bus shall be a Master-Slave/Token-Passing (MS/TP) Bus supporting BACnet Standard Protocol SSPC-135, Clause 9.
  - .2 The SA Bus shall support a minimum of 10 devices per trunk.
  - .3 The SA Bus shall operate at a maximum distance of 360 metres between the FEC and the furthest connected device.
- .9 The FEC shall have the capability to execute complex control sequences involving direct wired I/O points as well as input and output devices communicating over the FC Bus or the SA Bus.
  - .1 The FEC shall support, but not be limited to, the following applications:
    - .1 Built-up air handling units
    - .2 Terminal & package units
    - .3 Special programs as required for systems control

.8 Field Devices

.1 Input/Output Module (IOM)

- .1 The Input/Output Module (IOM) provides additional inputs and outputs for use in the FEC and FAC.
- .2 The IOM shall communicate with the FEC/FAC over the FC Bus or the SA Bus.
- .3 The IOM shall support BACnet Standard MS/TP Bus Protocol ASHRAE SSPC-135, Clause 9 on the controller network.
  - .1 The IOM shall be BACnet Testing Labs (BTL) certified and carry the BTL Label.
  - .2 The IOM shall be tested and certified as a BACnet Application Specific Controller (B-ASC).
  - .3 A BACnet Protocol Implementation Conformance Statement shall be provided for the FEC.
  - .4 The Conformance Statement shall be submitted 10 days prior to bidding.
- .4 The IOM shall be assembled in a plenum-rated plastic housing with flammability rated to UL94-5VB.
- .5 The IOM shall have a minimum of 4 points to a maximum of 17 points.
- .6 The IOM shall support the following types of inputs and outputs:
  - .1 Universal inputs shall be configured to monitor any of the following:
    - .1 Analog Input, Voltage Mode
    - .2 Analog Input, Current Mode
    - .3 Analog Input, Resistive Mode
    - .4 Binary Input, Dry Contact Maintained Mode
    - .5 Binary Input, Pulse Counter Mode
  - .2 Binary inputs shall be configured to monitor either of the following:
    - .1 Dry Contact Maintained Mode
    - .2 Pulse Counter Mode
  - .3 Analog outputs shall be configured to output either of the following
    - .1 Analog Output, Voltage Mode
    - .2 Analog Output, current Mode
  - .4 Binary outputs shall output the following:

- .1 24 VAC Triac
  - .5 Configurable outputs shall be capable of the following:
    - .1 Analog Output, Voltage Mode
    - .2 Binary Output Mode
  - .7 The IOM shall include troubleshooting LED indicators to identify the following conditions:
    - .1 Power On
    - .2 Power Off
    - .3 Download or Startup in progress, not ready for normal operation
    - .4 No Faults
    - .5 Device Fault
    - .6 Normal Data Transmission
    - .7 No Data Transmission
    - .8 No Communication
- .2 Networked Thermostat (Type 1)
  - .1 The networked thermostat shall be capable of controlling air handling unit
  - .2 Communicate over the Field Controller Bus using BACnet Standard MS/TP Bus Protocol
  - .3 BACnet Testing Labs (BTL) certified and carry the BTL Label.
  - .4 Support remote read/write and parameter adjustment from the web based User Interfaceable through a Network Automation Engine.
  - .5 Include an intuitive User Interface providing plain text messages.
    - .1 Two line, 8 character backlit display
    - .2 LED indicators for Fan, Heat, and Cool status
    - .3 Five (5) User Interface Keys
      - .1 Mode
      - .2 Fan
      - .3 Override
      - .4 Degrees C/F
      - .5 Up/Down
    - .4 The display shall continuously scroll through the following parameters:
      - .1 Room Temperature

- .2 System Mode
  - .3 Schedule Status – Occupied/Unoccupied/Override
  - .4 Applicable Alarms
- .6 The Networked Thermostat shall provide the flexibility to support any one of the following inputs:
  - .1 Integral Indoor Air Temperature Sensor
  - .2 Duct Mount Air Temperature Sensor
  - .3 Remote Indoor Air Temperature Sensor with Occupancy Override and LED Indicator
  - .4 Two configurable binary inputs
- .7 The Networked Thermostat shall provide the flexibility to support any one of the following outputs:
  - .1 Fan Speed
  - .2 Two On/Off
  - .3 Two Floating
  - .4 Two Proportional (0 to 10V)
- .8 The Networked Thermostat shall provide a minimum of six levels of keypad lockout.
- .9 The Networked Thermostat shall provide the flexibility to adjust the following parameters:
  - .1 Adjustable temporary occupancy from 0 to 24 hours
  - .2 Adjustable heating/cooling deadband from 0.5°C to 1.5°C (1°F to 3°F)
  - .3 Adjustable heating/cooling cycles per hour from 4 to 8
- .10 The Networked Thermostat shall employ nonvolatile electrically erasable programmable read-only memory (EEPROM) for all adjustable parameters.
- .3 Networked Thermostat (Type 2)
  - .1 The Networked Thermostat shall be capable of controlling a pressure dependent Variable Air Volume System or other similar zoning type systems employing reheat including local hydronic reheat valves.
  - .2 Communicate over the FC Bus using BACnet Standard protocol.
  - .3 The TEC shall be BACnet Testing Labs (BTL) certified and carry the BTL Label.
  - .4 Capable of remote read/write and parameter adjustment from the web based User Interface (UI) through an NAE.

- .5 The Networked Thermostat shall include an intuitive UI providing plain text messages.
  - .1 Two line, eight character backlit display
  - .2 LED indicators for Heating, and cooling status
  - .3 Three User Interface Keys
    - .1 Override
    - .2 Up
    - .3 Down
- .6 The display shall continuously scroll through the following parameters:
  - .1 Room Temperature
  - .2 System Mode
  - .3 Schedule Status – Occupied/Unoccupied/Override
  - .4 Applicable Alarms
- .7 The Networked Thermostat shall provide the flexibility to support any one of the following inputs:
  - .1 Integral Indoor Air Temperature Sensor
  - .2 Duct Mount Air Temperature Sensor
  - .3 Remote Indoor Air Temperature Sensor with Occupancy Override and LED Indicator
- .8 Two configurable binary inputs
- .9 The Networked Thermostat shall provide the flexibility to support either of the following outputs:
  - .1 Two On/Off or Floating
  - .2 Two Proportional (0 to 10V)
- .10 The Networked Thermostat shall provide a minimum of six (6) levels of keypad lockout.
- .11 The Networked Thermostat shall provide the flexibility to adjust the following parameters:
  - .1 Adjustable Temporary Occupancy from 0 to 24 hours
  - .2 Adjustable heating/cooling deadband from 1°C to 3°C (2°F to 5°F)
  - .3 Adjustable heating/cooling cycles per hour from 4 to 8
- .12 The Networked Thermostat shall employ nonvolatile electrically erasable programmable read-only memory (EEPROM) for all adjustable parameters.

- .1 The VAV Modular Assembly shall provide both standalone and networked direct digital control of pressure-independent, variable air volume terminal units. It shall address both single and dual duct applications.
- .2 The VMA shall be BACnet Testing Labs (BTL) certified and carry the BTL Label.
- .3 The VAV Modular Assembly shall communicate over the FC Bus using BACnet Standard protocol.
- .4 The VAV Modular Assembly shall have internal electrical isolation for AC power, DC inputs, and MS/TP communications. An externally mounted isolation transformer shall not be acceptable.
- .5 The VAV Modular Assembly shall be a configurable digital controller with integral differential pressure transducer and damper actuator. All components shall be connected and mounted as a single assembly that can be removed as one piece.
- .6 The VAV Modular Assembly shall be assembled in a plenum-rated housing.
- .7 The integral damper actuator shall be a fast response stepper motor capable of stroking 90 degrees in 60 seconds for quick damper positioning to speed commissioning and troubleshooting tasks.
- .8 The controller shall determine airflow by a state-of-the-art digital non-flow pressure sensor to provide 14-bit resolution with bidirectional flow operation that supports automatic correction for polarity on high- and low-pressure DP tube connections; this pressure sensor eliminates high- and low-pressure connection mistakes.
- .9 Each controller shall have the ability to automatically calibrate the flow sensor to eliminate pressure transducer offset error due to ambient temperature / humidity effects.
- .10 The controller shall utilize a proportional plus integration (PI) algorithm for the space temperature control loops.
- .11 Each controller shall continuously, adaptively tune the control algorithms to improve control and controller reliability through reduced actuator duty cycle.
- .12 The controller shall provide the ability to download and upload VMA configuration files, both locally and via the communications network. Controllers shall be able to be loaded individually or as a group using a zone schedule generated spreadsheet of controller parameters.
- .13 Control setpoint changes initiated over the network shall be written to VMA non-volatile memory to prevent loss of setpoint changes and to provide consistent operation in the event of communication failure.
- .14 The controller firmware shall be flash-upgradeable remotely via the communications bus to minimize costs of feature enhancements.
- .15 The controller shall provide fail-soft operation if the airflow signal becomes unreliable, by automatically reverting to a pressure-dependent control mode.

- .16 The controller shall interface with balancer tools that allow automatic recalculation of box flow pickup gain ("K" factor), and the ability to directly command the airflow control loop to the box minimum and maximum airflow setpoints.
- .17 Controller performance shall be self-documenting via on-board diagnostics. These diagnostics shall consist of control loop performance measurements executing at each control loop's sample interval, which may be used to continuously monitor and document system performance. The VMA shall calculate exponentially weighted moving averages (EWMA) for each of the following. These metrics shall be available to the end user for efficient management of the VAV terminals.
  - .1 Absolute temperature loop error
  - .2 Signed temperature loop error
  - .3 Absolute airflow loop error
  - .4 Signed airflow loop error
  - .5 Average damper actuator duty cycle
- .18 The controller shall detect system error conditions to assist in managing the VAV zones. The error conditions shall consist of:
  - .1 Unreliable space temperature sensor
  - .2 Unreliable differential pressure sensor
  - .3 Starved box
  - .4 Actuator stall
  - .5 Insufficient cooling
  - .6 Insufficient heating
- .19 The controller shall provide a flow test function to view damper position vs. flow in a graphical format. The information would alert the user to check damper position. The VMA shall also provide a method to calculate actuator duty cycle as an indicator of damper actuator runtime.
- .20 The controller shall provide a compliant interface for ASHRAE Standard 62.1 (indoor air quality), and shall be capable of resetting the box minimum airflow based on the percent of outdoor air in the primary air stream.
- .21 The controller shall comply with ASHRAE Standard 90.1 (energy efficiency) by preventing simultaneous heating and cooling, and where the control strategy requires reset of airflow while in reheat, by modulating the box reheat device fully open prior to increasing the airflow in the heating sequence.
- .22 Inputs:
  - .1 Analog inputs with user defined ranges shall monitor the following analog signals, without the addition of equipment outside the terminal controller cabinet:

- .1 0-10 VDC Sensors
  - .2 1000ohm RTDs
  - .3 NTC Thermistors
- .2 Binary inputs shall monitor dry contact closures. Input shall provide filtering to eliminate false signals resulting from input "bouncing."
- .3 For noise immunity, the inputs shall be internally isolated from power, communications, and output circuits.
- .4 Provide side loop application for humidity control.
- .23 Outputs
  - .1 Analog outputs shall provide the following control outputs:
    - .1 0-10 VDC
  - .2 Binary outputs shall provide a SPST Triac output rated for 500mA at 24 VAC.
  - .3 For noise immunity, the outputs shall be internally isolated from power, communications, and other output circuits.
- .24 Application Configuration
  - .1 The VAV Modular Assembly shall be configured with a software tool that provides a simple Question/Answer format for developing applications and downloading.
- .25 Sensor Support
  - .1 The VAV Modular Assembly shall communicate over the Sensor-Actuator Bus (SA Bus) with a Network Sensor.
  - .2 The VMA shall support an LCD display room sensor.
  - .3 The VMA shall also support standard room sensors as defined by analog input requirements.
  - .4 The VMA shall support humidity sensors defined by the AI side loop.
- .5 Network Sensors (NS)
  - .1 The Network Sensors (NS) shall have the ability to monitor the following variables as required by the systems sequence of operations:
    - .1 Zone Temperature
    - .2 Zone Humidity
    - .3 Zone Setpoint
    - .4 Discharge Air Temperature
    - .5 Zone CO2

- .2 The NS shall transmit the information back to the controller using BACnet Standard protocol.
- .3 The NS shall be BACnet Testing Labs (BTL) certified and carry the BTL Label.
- .4 The Network Zone Sensors shall include the following items:
  - .1 A backlit Liquid Crystal Display (LCD) to indicate the Temperature, Humidity and Setpoint (if indicated on drawings)
  - .2 An LED to indicate the status of the Override feature
  - .3 A button to toggle the temperature display between Fahrenheit and Celsius
  - .4 A button to program the display for temperature or humidity
  - .5 A button to initiate a timed override command
  - .6 Available in either surface mount, wall mount, or flush mount
  - .7 Available with either screw terminals or phone jack
- .5 The Network Discharge Air Sensors shall include the following:
  - .1 4 inch or 8 inch duct insertion probe
  - .2 10 foot pigtail lead
  - .3 Dip Switches for programmable address selection
  - .4 Ability to provide an averaging temperature from multiple locations
  - .5 Ability to provide a selectable temperature from multiple locations
- .6 The Network CO2 Zone Sensors shall include the following:
  - .1 Available in either surface mount or wall mount
  - .2 Available with screw terminals or phone jack
  - .3 in NEMA 1 plastic housings.

## 2.4 **SENSORS AND TRANSMITTERS**

- .1 General Requirements
  - .1 Installation, testing, and calibration of all sensors, transmitters, and other input devices shall be provided to meet the system requirements.
  - .2 Acceptable manufacturers:
    - .1 Johnson Control Inc
    - .2 Honeywell
    - .3 Automated Logic

.2 Temperature Sensors

.1 General Requirements:

- .1 Sensors and transmitters shall be provided, as outlined in the input/output summary and sequence of operations.
- .2 The temperature sensor shall be of the resistance type, and shall be either two-wire 1000 ohm nickel RTD, or two-wire 1000 ohm platinum RTD.
- .3 The following point types (and the accuracy of each) are required, and their associated accuracy values include errors associated with the sensor, lead wire, and A to D conversion:

Point Type	Accuracy
Room Temp	$\pm 0.3^{\circ}\text{C}$ .
Duct Temperature	$\pm 0.3^{\circ}\text{C}$ .
All Others	$\pm 0.5^{\circ}\text{C}$ .

.2 Room Temperature Sensors

- .1 Room sensors shall be constructed for either surface or wall box mounting.
- .2 Room sensors shall have the following options when specified:
  - .1 Setpoint warmer/cooler dial or reset slide switch providing a  $\pm 1^{\circ}\text{C}$  (adjustable) range.
  - .2 Individual heating/cooling setpoint switches.
  - .3 A momentary override request push button for activation of after-hours operation.
  - .4 Analog thermometer.

.3 Room Temperature Sensors with Integral Display

- .1 Room sensors shall be constructed for either surface or wall box mounting.
- .2 Room sensors shall have an integral LCD display and four button keypad with the following capabilities:
  - .1 Display room air temperatures.
  - .2 Display and adjust room comfort setpoint.
  - .3 Display and adjust fan operation status.
  - .4 Timed override request push button with LED status for activation of after-hours operation.
  - .5 Display controller mode.
  - .6 Password selectable adjustment of setpoint and override modes.

.4 Thermowells

- .1 Thermowell manufacturer shall have models available in stainless steel, brass body, and copper bulb.
  - .2 When thermowells are required, the sensor and well shall be supplied as a complete assembly, including wellhead and sensor.
  - .3 Thermowells shall be pressure rated and constructed in accordance with the system working pressure.
  - .4 Thermowells and sensors shall be mounted in a direct mount (no adapter) offering faster installation or 1/2" NPT saddle and allow easy access to the sensor for repair or replacement.
  - .5 Thermowells constructed of 316 stainless steel shall comply with Canadian Registration Number (CRN) pressure vessel rating.
- .5 Outside Air Sensors
  - .1 Outside air sensors shall be designed to withstand the environmental conditions to which they will be exposed. They shall also be provided with a solar shield.
  - .2 Sensors exposed to wind velocity pressures shall be shielded by a perforated plate that surrounds the sensor element.
  - .3 Temperature transmitters shall be of NEMA 3R or NEMA 4 construction and rated for ambient temperatures.
  - .4 The outdoor sensor shall be easily mounted on a roof, pole or side of a building utilizing its already assembled mounting bracket.
  - .5 Outside Relative Humidity sensors 0-100% full range of accurate measurement. Operating temperature -20 to 60°C (-4 to 140°F).
  - .6 Outside temperature sensors operating temperature range is -40 to 60°C (-40 to 140°F), +/- 0.3°C (+/- 0.5°F).
- .6 Duct Mount Sensors
  - .1 Duct mount sensors shall mount in an electrical box through a hole in the duct, and be positioned so as to be easily accessible for repair or replacement.
  - .2 Duct sensors shall be insertion type and constructed as a complete assembly, including lock nut and mounting plate.
  - .3 For outdoor air duct applications, a weatherproof mounting box with weatherproof cover and gasket shall be used.
- .7 Averaging Sensors
  - .1 For ductwork greater in any dimension than 1200 mm and/or where air temperature stratification exists, an averaging sensor with multiple sensing points shall be used.
  - .2 For plenum applications, such as mixed air temperature measurements, a continuous averaging sensor or a string of sensors mounted across the plenum shall be used to account for stratification and/or air turbulence. The averaging string shall have a minimum of 4 sensing points per 3000 mm long segment.

- .3 Capillary supports at the sides of the duct shall be provided to support the sensing string.

### .3 Humidity Sensors

- .1 The sensor shall be a solid-state type, relative humidity sensor of the Thin Film Capacitance or Bulk Polymer Design. The sensor element shall resist service contamination.
- .2 The humidity transmitter shall be equipped with non-interactive span and zero adjustments, a 2-wire isolated loop powered, 4-20 mA, 0-100% linear proportional output.
- .3 The humidity transmitter shall meet the following overall accuracy, including lead loss and Analog to Digital conversion. 3% between 20% and 80% RH @ 25°C unless specified elsewhere.
- .4 Outside air relative humidity sensors shall be installed with a rain proof, perforated cover. The transmitter shall be installed in a NEMA 3R or NEMA 4 enclosure with sealtite fittings.
- .5 A single point humidity calibrator shall be provided, if required, for field calibration. Transmitters shall be shipped factory pre-calibrated.
- .6 Duct type sensing probes shall be constructed of 304 stainless steel, and shall be equipped with a neoprene grommet, bushings, and a mounting bracket.

### .4 Differential Pressure Transmitters

- .1 General Air and Water Pressure Transmitter Requirements:
  - .1 Pressure transmitters shall be constructed to withstand 100% pressure over-range without damage, and to hold calibrated accuracy when subject to a momentary 40% over-range input.
  - .2 Pressure transmitters shall transmit a 0 to 5 VDC, 0 to 10 VDC, or 4 to 20 mA output signal.
  - .3 Differential pressure transmitters used for flow measurement shall be sized to the flow sensing device, and shall be supplied with Tee fittings and shut-off valves in the high and low sensing pick-up lines to allow the balancing Contractor and Owner permanent, easy-to-use connection.
  - .4 A minimum of a NEMA 1 housing shall be provided for the transmitter. Transmitters shall be located in accessible local control panels wherever possible.
- .2 Building Differential Air Pressure Applications (-250 Pa to +250 Pa)
  - .1 The differential pressure transmitter shall be of industrial quality and transmit a linear, 4 to 20 mA output in response to variation of differential pressure or air pressure sensing points.
  - .2 The differential pressure transmitter shall have non-interactive zero and span adjustments that are adjustable from the outside cover and meet the following performance specifications:
    - .1 -250 Pa to +250 Pa input differential pressure ranges.
    - .2 4-20 mA output.

- .3 Maintain accuracy up to 20 to 1 ratio turndown.
      - .4 Reference Accuracy: +0.2% of full span.
    - .3 Low Differential Air Pressure Applications (0 to 625 Pa)
      - .1 The differential pressure transmitter shall be of industrial quality and transmit a linear, 4 to 20 mA output in response to variation of differential pressure or air pressure sensing points.
      - .2 The differential pressure transmitter shall have non-interactive zero and span adjustments that are adjustable from the outside cover and meet the following performance specifications:
        - .1 0 to 500 Pa input differential pressure ranges.
        - .2 4-20 mA, 0-5 VDC, 0-10 VDC, output.
        - .3 Maintain accuracy up to 20 to 1 ratio turndown.
        - .4 Reference Accuracy: +0.25%, or 0.5% of full span.
- .5 Power Monitoring Devices
  - .1 Current Measurement (Amps)
    - .1 Current measurement shall be by a combination current transformer and a current transducer. The current transformer shall be sized to reduce the full amperage of the monitored circuit to a maximum 5 Amp signal, which will be converted to a 4-20 mA DDC compatible signal for use by the Facility Management System.
    - .2 Current Transformer: A split core current transformer shall be provided to monitor motor amps.
      - .1 Operating frequency – 50 - 400 Hz.
      - .2 Insulation – 0.6 Kv class 10Kv BIL.
      - .3 UL recognized.
      - .4 Five amp secondary.
      - .5 Select current ration as appropriate for application.
      - .6 Acceptable manufacturers: Setra
    - .3 Current Transducer: A current to voltage or current to mA transducer shall be provided. The current transducer shall include:
      - .1 6X input over amp rating for AC inrushes of up to 120 amps.
      - .2 Manufactured to UL 1244.
      - .3 Accuracy: +.5%, Ripple +1%.
      - .4 Minimum load resistance 30kOhm.
      - .5 Input 0-20 Amps.
      - .6 Output 4-20 mA.

- .7 Transducer shall be powered by a 24VDC regulated power supply (24 VDC +5%).
  - .8 Acceptable manufacturers: Setra
- .6 Smoke Detectors
  - .1 Ionization type air duct detectors shall be furnished as specified elsewhere in Division 26 for installation under Division 23. All wiring for air duct detectors shall be provided under Division 28, Fire Alarm System.
- .7 Status and Safety Switches
  - .1 General Requirements
    - .1 Switches shall be provided to monitor equipment status, safety conditions, and generate alarms at the BMS when a failure or abnormal condition occurs. Safety switches shall be provided with two sets of contacts and shall be interlock wired to shut down respective equipment.
    - .2 Acceptable manufacturers:
      - .1 Johnson Control Inc
      - .2 Honeywell
      - .3 Automated Logic
  - .2 Current Sensing Switches
    - .1 The current sensing switch shall be self-powered with solid-state circuitry and a dry contact output. It shall consist of a current transformer, a solid state current sensing circuit, adjustable trip point, solid state switch, SPDT relay, and an LED indicating the on or off status. A conductor of the load shall be passed through the window of the device. It shall accept over-current up to twice its trip point range.
    - .2 Current sensing switches shall be used for run status for fans, pumps, and other miscellaneous motor loads.
    - .3 Current sensing switches shall be calibrated to show a positive run status only when the motor is operating under load. A motor running with a broken belt or coupling shall indicate a negative run status.
  - .3 Air Filter Status Switches
    - .1 Differential pressure switches used to monitor air filter status shall be of the automatic reset type with SPDT contacts rated for 2 amps at 120VAC.
    - .2 A complete installation kit shall be provided, including: static pressure tops, tubing, fittings, and air filters.
    - .3 Provide appropriate scale range and differential adjustment for intended service.
  - .4 Air Flow Switches

- .1 Differential pressure flow switches shall be bellows actuated mercury switches or snap acting micro-switches with appropriate scale range and differential adjustment for intended service.
- .5 Air Pressure Safety Switches
  - .1 Air pressure safety switches shall be of the manual reset type with SPDT contacts rated for 2 amps at 120VAC.
  - .2 Pressure range shall be adjustable with appropriate scale range and differential adjustment for intended service.
- .6 Low and High Temperature Limit Switches
  - .1 The low temperature limit switch shall be of the manual reset type with Double Pole/Single Throw snap acting contacts rated for 16 amps at 120VAC.
  - .2 The sensing element shall be a minimum of 4.5 metres in length and shall react to the coldest or hottest section. Element shall be mounted horizontally across duct in accordance with manufacturers recommended installation procedures.
  - .3 For large duct areas where the sensing element does not provide full coverage of the air stream, additional switches shall be provided as required to provide full protection of the air stream.
  - .4 Acceptable manufacturers:
    - .1 Johnson Controls Ltd.
    - .2 Honeywell
    - .3 Automated Logic
- .8 Control Relays
  - .1 Control Pilot Relays
    - .1 Control pilot relays shall be of a modular plug-in design with retaining springs or clips.
    - .2 Mounting Bases shall be snap-mount.
    - .3 DPDT, 3PDT, or 4PDT relays shall be provided, as appropriate for application.
    - .4 Contacts shall be rated for 10 amps at 120VAC.
    - .5 Relays shall have an integral indicator light and check button.
- .9 Electronic Signal Isolation Transducers
  - .1 A signal isolation transducer shall be provided whenever an analog output signal from the BMS is to be connected to an external control system as an input (such as a chiller control panel), or is to receive as an input signal from a remote system.
  - .2 The signal isolation transducer shall provide ground plane isolation between systems.

- .3 Signals shall provide optical isolation between systems.
- .4 Acceptable manufacturers: Advanced Control Technologies

**.10 Thermostats**

- .1 Electric room thermostats of the heavy-duty type shall be provided for electric heaters. All these items shall be provided with concealed adjustment. Finish of covers for all room-type instruments shall match and, unless otherwise indicated or specified, covers shall be manufacturer's standard finish.

**2.5 CONTROL AIR DAMPERS**

**.1 Type**

- .1 Modulating control dampers
  - .1 Opposed blades
- .2 Two position control dampers
  - .1 Parallel blades

**.2 Construction**

- .1 Bearings
  - .1 Thermal plastic resin copolymer, nylon or impregnated bronze
  - .2 At blade axles, linkage devices, etc.
- .2 Damper blades and frames
  - .1 Extruded aluminum
  - .2 Maximum blade length: 1.2 m without internal frame support
  - .3 Blade edge seals: EPDM gaskets
  - .4 Frame side seals: extruded TPE
  - .5 Frame style: flanged to duct
  - .6 Jack shaft: extendable, combination of aluminum and zinc/nickel coated steel
  - .7 Damper leakage: 50 L/s per m<sup>2</sup> damper face area at 1 kPa differential static pressure
- .3 Damper blades for outside air applications
  - .1 As above
  - .2 Operating temperature: -40°C to 100°C
  - .3 Thermally broken and insulated blades; expanded polyurethane foam insulation
  - .4 Damper leakage: 21 L/s per m<sup>2</sup> damper face area at 1 kPa differential static pressure

- .4 Acceptable manufacturer:
  - .1 Tamco – Series 1000
  - .2 Tamco – Series 9000 (outside air applications)
  - .3 Nailor
  - .4 Ruskin
  - .5 Alumavent

## 2.6 VALVE AND DAMPER OPERATORS

### .1 General

- .1 Provide valves and dampers with metal body operators sized to assure smooth, positive operation over the entire operating range, without chatter or slamming, and to give tight shutoff at end positions against the system pressures to be encountered.
- .2 Failure position:
  - .1 Spring return, normally open or normally closed sequence as required so that systems will “Fail-safe” in case of control air pressure or power failure.
  - .2 On 2-way butterfly valves, Provide double acting or reversible actuators.
- .3 Sequencing by spring range will not be approved for valves or dampers.
- .4 Furnish valves and dampers with operators and spring ranges designed to match as linearly as possible the full scale operating range of the control valve.
- .5 Adequately size operators and in sufficient quantity to ensure smooth damper operation.

### .2 Selection

- .1 Indoor
  - .1 Electric
- .2 Outdoor
  - .1 Electric
- .3 Ancillary devices
  - .1 End switches as detailed
  - .2 Pilot positioner relays
  - .3 Interconnection piping

### .3 Electronic Actuators

- .1 General
  - .1 Low torque, fully modulating or two position as indicated.
  - .2 Time for full open to full close: two minutes nominal

- .3 Current limiting, digital motor rotation sensing circuits, or adjustable end of travel switches to provide motor protection.
- .4 Tandem mounting of actuators for higher torque requirements are acceptable.
- .5 Spring return with manual override unless otherwise indicated or specified.
- .6 On loss of control signal, valve will fail to the designated normally open or closed position.
- .2 Terminal equipment
  - .1 Non-spring return type
- .3 Power and communications
  - .1 Positive positioning at 2-10 VDC or 4-20 mA signal
  - .2 Visual position indicator
  - .3 Built-in rotation reversing switch
  - .4 Actuator generated 2-10 VDC electronic feedback signal
  - .5 Capacity to add auxiliary switches when required
  - .6 Power: 24 VAC or VDC for proportional control, 24 or 120 VAC for 2 position, maximum 15 VA.

## 2.7 **GAS DETECTION SYSTEM**

- .1 Gas Detection Control panel
  - .1 CSA approved
  - .2 Microprocessor based central gas detection system control to provide gas detection and control functionality as described herein, in the controls sequences, and as shown on the drawings.
  - .3 Capable of communication with gas detection sensors through -485 communications bus.
  - .4 Capable of activating up to 32 separate relay modules.
  - .5 Capable of communication with a separate annunciator panel.
  - .6 Control panel shall include a backlit, alphanumeric, LCD to indicate the detected levels for each sensor.
  - .7 The control panel shall include separate LED indication as follows:
    - .1 Green LED: Normal operation
    - .2 Red LED: Alarm (level 1 and 2)
    - .3 Amber/Yellow LED: Sensor or control failure.
  - .8 Integrated 65 dBA alarm.
  - .9 Manufacturers

- .1 Vulcain / Honeywell
- .2 MSA
- .3 Critical Environment Technologies Canada

.2 Gas Detection Sensors - general

- .1 Standalone gas detection transmitter with 120/24 built-in step down transformer, remote gas sensor.
- .2 NEMA 4X or approved equivalent enclosure.
- .3 Capable of activating up to 32 separate relay modules.
- .4 Capable of communication with a separate annunciator panel.
- .5 Control panel shall include a backlit, alphanumeric, LCD to indicate the detected levels for each sensor.
- .6 Transmitter
  - .1 Remote electrochemical cell for monitoring listed gas as per Drawings.
  - .2 Complete with local LED indication for high and low alarm as well as a green LED power "ON" light
  - .3 Power: 24 VDC
  - .4 Replaceable gas cartridge with smart sensor capable of self-testing.
  - .5 Accuracy:  $\pm 3\%$
  - .6 Capable of operating within 5-95% RH and -20°C to 40°C
  - .7 Factory calibrated and certified without the requirement for Site calibration.
  - .8 On-board audible alarm with 85 dBA at 3 metres.
  - .9 LCD display to provide local gas concentration reading.
  - .10 Sufficient relays to activate exhaust fans.
  - .11 Minimum three (3) relays.
- .7 Location: The Drawings indicate approximate quantity and layout of sensors. The detector manufacturer shall review the application and locations and revise as necessary. The Contractor shall allow for a minimum of five more detectors than shown on Drawings.
- .8 System supplier to provide site inspection, operating and maintenance instructions and a trained technician to perform system start-up and calibration checks.
- .9 Manufacturer
  - .1 Vulcain (Honeywell)
  - .2 MSA
  - .3 Critical Environment Technologies Canada

- .10 Sequence of Operation
  - .1 Refer to Drawings.
  - .2 At low level alarm, low alarm LED lights on. Low level alarm remains until gas concentration level below first alarm set point.
  - .3 At high level alarm, high alarm LED lights on and audible alarm horn activates.
  - .4 Alarm setting: refer to drawings
- .3 CO Detectors
  - .1 Carbon monoxide (CO) sensors
  - .2 Powered from separate 120V power supply
  - .3 Capable of communicating with a central gas detection system control panel from the same manufacturer as the sensors.
  - .4 Location: The drawings indicate approximate quantity and layout of sensors. The detector manufacturer shall review the application and layout and revise as necessary to suit the detector supplied. The Contractor shall allow for a minimum of five more detectors than shown on the drawings.
  - .5 Measuring range: 0 - 250 PPM.
  - .6 Alarm setting range: 0 - 250 PPM.
  - .7 System performance: Repeatability: +/-1.0% full scale. Accuracy: +/- 5% full scale
  - .8 Outputs: 4 - 20mA, linear
  - .9 Power input: 24 VAC, 60 Hz, 200 VA Max.
  - .10 Sensor enclosure: Heavy duty aluminum.
  - .11 Sensor life: Sensors shall be warranted to have a minimum useful life of one year.
  - .12 Sensor distance: Maximum distance from sensor to controller shall be 610 m.
  - .13 Sensors in wash areas shall be complete with splash guards. Sensors in truss space complete with remote sensing and remote calibration.
  - .14 Manufacturer:
    - .1 Vulcain (Honeywell)
    - .2 MSA Instrument Div.
    - .3 Critical Environment Technologies Canada
- .4 CO<sub>2</sub> Detectors
  - .1 Carbon dioxide (CO<sub>2</sub>) sensors.
  - .2 Simultaneously monitor the temperature (either in Celsius or Fahrenheit) and the relative humidity in addition to carbon dioxide

- .3 Powered from separate 24 V power supply. Provide 120/24 low voltage control transformer mounted adjacent to sensor.
- .4 Capable of communicating with a central gas detection system control panel from the same manufacturer as the sensors.
- .5 The detection unit, digital version, shall be able to communicate with a BAS using a BACnet MS/TP.
- .6 Location: The drawings indicate approximate quantity and layout of sensors. The detector manufacturer shall review the application and layout and revise as necessary to suit the detector supplied. The contractor shall allow for a minimum of five more detectors than shown on the drawings.
- .7 Measuring range: 0 – 2000 ppm. Response time of less than 60 seconds (adjustable).
- .8 Alarm setting range: 1200 ppm alarm.
- .9 System performance: Repeatability: +/-1.0% full scale. Accuracy: +/- 5% full scale
- .10 Outputs: 4 - 20mA, linear
- .11 Power input: 24 VAC, 60 Hz, 200 VA Max.
- .12 Graphic LCD 122 x 32 displays and programmable by three buttons in the front panel
- .13 Sensor enclosure: Heavy duty aluminum.
- .14 Sensor life: Sensors shall be warranted to have a minimum useful life of one year.
- .15 Sensor distance: Maximum distance from sensor to controller shall be 600 m.
- .16 Wall mounted where shown on the drawings
- .17 Manufacturer:
  - .1 Vulcain (Honeywell)
  - .2 MSA Instrument Div.
  - .3 Critical Environment Technologies Canada.
- .5 NO<sub>2</sub> Detectors
  - .1 Nitrogen oxide (NO<sub>2</sub>) sensors
  - .2 Powered from separate 120V power supply
  - .3 Capable of communicating with a central gas detection system control panel from the same manufacturer as the sensors.
  - .4 Location: The drawings indicate approximate quantity and layout of sensors. The detector manufacturer shall review the application and layout and revise as necessary to suit the detector supplied. The Contractor shall allow for a minimum of five more detectors than shown on the drawings.
  - .5 Measuring range: 0 - 10 PPM.

- .6 Alarm setting range: 0 - 10 PPM.
- .7 System performance: Repeatability: +/-1.0% full scale. Accuracy: +/- 5% full scale.
- .8 Outputs: 4 - 20mA, linear.
- .9 Power input: 24 VAC, 60 Hz., 200 VA Max.
- .10 Sensor enclosure: Heavy duty aluminum.
- .11 Sensor life: Sensors shall be warranted to have a minimum useful life of one year.
- .12 Sensor distance: Maximum distance from sensor to controller shall be 610 m.
- .13 Sensors in wash areas shall be complete with splash guards. Sensors in truss space complete with remote sensing and remote calibration.
- .14 Manufacturer:
  - .1 Vulcain (Honeywell)
  - .2 MSA Instrument Div.
  - .3 Critical Environment Technologies Canada
- .6 VOC Detectors
  - .1 Volatile Organic Compound (VOC) sensors
  - .2 Powered from separate 24 V power supply
  - .3 Capable of communicating with a central gas detection system control panel from the same manufacturer as the sensors.
  - .4 Location: The drawings indicate approximate quantity and layout of sensors. The detector manufacturer shall review the application and layout and revise as necessary to suit the detector supplied. The Contractor shall allow for a minimum of five more detectors than shown on the drawings.
  - .5 Measuring range: 0 – 100% LEL.
  - .6 Alarm setting range: 25% LEL first alarm, second alarm 50% LEL.
  - .7 System performance: Repeatability: +/-1.0% full scale. Accuracy: +/- 5% full scale
  - .8 Outputs: 4 - 20mA, linear
  - .9 Power input: 24 VAC, 60 Hz, 200 VA Max.
  - .10 Sensor enclosure: Heavy duty aluminum.
  - .11 Sensor life: Sensors shall be warranted to have a minimum useful life of one year.
  - .12 Sensor distance: Maximum distance from sensor to controller shall be 610 m.
  - .13 Manufacturer:
    - .1 Vulcain (Honeywell)

- .2 MSA Instrument Div.
- .3 Critical Environment Technologies Canada.

## 2.8 **EQUIPMENT SUPPORTS**

- .1 Support Frames: galvanized modular framing system: Unistrut.
- .2 Backboards: 20 mm fire rated plywood.

## 3 Execution

### 3.1 **EXAMINATION**

- .1 Thoroughly examine the design documentation for control devices and equipment. Notify the Consultant of any discrepancies, conflicts or omissions prior to commencement of rough-in work.

### 3.2 **INSTALLATION**

- .1 Execute work in accordance with requirements specified in the various sections of Division 25, and where referenced to other divisions.
- .2 Lay out the work so that it does not interfere with Work under other divisions of Specifications.
- .3 Make good any damage to Owner's property or other trade's work caused by improperly locating or carrying out of work.
- .4 Location of pipes, ductwork, raceways and equipment may be altered without extra cost provided alteration is made before installation.

### 3.3 **PROTECTION**

- .1 Protect work and materials before, during and after erection from weather and other hazards and keep in a clean and orderly manner.
- .2 Protect pipe ends, valves and parts of equipment left unconnected to prevent damage or intrusion of foreign matter. Provide pipe caps for threaded male connections and plugs for threaded female connections.

### 3.4 **PAINTING**

- .1 With the exception of prime painting of miscellaneous steel or any other specific requirements as specified under the respective sections of this Work, or equipment otherwise factory painted, all painting will be provided under Division 09.
- .2 Field Prime Painting
  - .1 Mechanical rooms, boiler rooms, fan rooms, crawl spaces, pipe tunnels and penthouses; paint exposed galvanized metal surfaces with one coat of zinc dust galvanized primer and one coat of 100% alkyd base enamel.
  - .2 Clean rust and oil from exposed iron and steel work provided under this division whether or not it has been factory prime painted. Paint this equipment with one coat of chrome oxide phenolic base primer and one coat of 100% alkyd base enamel in an approved colour.

### 3.5 **CONSTRUCTION REVIEW**

- .1 The construction review will include milestone and periodic reviews.

.2 Milestone Reviews

.1 Specific milestone reviews will be performed by the Consultant for compliance with the Ontario Building Code, including any or all of the following:

- .1 Equipment Demonstration and Training
- .2 Substantial Performance and Deficiency Review
- .3 Total Performance

.2 Some or all of these reviews are of portions of the Work which may be concealed. If Work is enclosed before the Consultant can review the installation, the Consultant may direct the Contractor to expose the Work for it to be examined, at no additional cost to the project including rework affecting other Trades.

.3 If deficiencies are noted during any review where work will be enclosed, correct noted deficiencies and have them reviewed by the Consultant prior to the Work being enclosed.

.4 Provide a minimum of seven (7) calendar days' written notice to the Consultant when requesting each review date.

.5 The Consultant will provide a checklist to the Contractor of required milestone reviews which must be completed. Maintain this list on site along with identified test reports, and make available for Consultant's review when requested. When completed, include this checklist form with the Test Reports forms specified in this Division.

.3 Periodic Reviews

.1 The Consultant will conduct periodic reviews, as required for the project. These reviews are for the benefit of the Owner to describe the progress and workmanship of the Work, and are not intended as any form of quality assurance for the Contractor.

.2 Deficiencies will generally not be reported as part of this review, as the work has not been reported by the Contractor as being complete. However, deficiencies may be reported where it may not be possible to correct the work at a later date, or at a great expense.

.3 The Contractor shall not rely on these Periodic Reviews to identify deficiencies during the progress of the Work.

.4 Deficiency Review

.1 The Consultant will conduct a deficiency review only after the Contractor submits an application for Substantial Performance. As part of this application, the Contractor shall submit its own comprehensive deficiency list of incomplete or incorrect work. Failure by the Contractor to list any deficiency does not relieve the Contractor from correcting or completing the Work.

.2 The Consultant shall review the work and any deficiencies noted will be classified as Major or Minor.

- .1 Major deficiencies are required to be corrected as part of obtaining Substantial Performance.

- .2 Minor deficiencies may be corrected before or after Substantial Performance.
- .5 Final Review
  - .1 The Consultant will conduct a final review only after the Contractor submits a declaration that all of the following has been completed:
    - .1 Noted deficiencies have been corrected.
    - .2 Final as-built drawings have been submitted to the Owner.
    - .3 Final Operating and Maintenance manuals have been submitted to the Owner.
    - .4 Final Test reports, including Alternate season tests have been submitted to the Owner.
- .6 The Consultant will only review the deficiency list to confirm these deficiencies have been corrected.
- .7 Tubing and Conduit
  - .1 Tubing and conduit: Follow horizontal and perpendicular building lines to fit into the layout of the area. Properly support and install in a neat and workmanlike manner throughout.
  - .2 Install panels in readily accessible locations. Unless otherwise shown, mount control panels at a height of 1800 mm from the floor to the top of the cabinet for units without operator input devices (LCD screens, keypads, etc). For units with operator input devices, mount unit so that the horizontal centerline of the LCD display is location 1650 mm above the floor.
  - .3 Verify integrity of all wiring to ensure continuity and freedom from shorts and grounds.
- 3.6 **LOCAL CONTROL PANELS**
  - .1 Install BCU and ECU controllers in separate EEMAC 4 or 12 panels, to suit location. Install operator LCD screen, where specified, on the front panel door to allow operator access without opening door.
  - .2 Support local control panels from fixed masonry or concrete walls. Do not support from drywall partition walls. Provide free standing support frames in other locations.
- 3.7 **WIRING COORDINATION**
  - .1 Provide wiring and conduit under this Section of the work as follows:
    - .1 Between ceiling mounted junction boxes and terminal unit controllers.
    - .2 Between MCC mounted receptacle panels in mechanical rooms and controllers and control devices within the same area.
    - .3 Provide circuit breakers in "RP" and "ERP" panels; provide breaker locks to prevent unauthorized use of the breaker.
  - .2 Power wiring provided under Division 26 as follows:
    - .1 120 VAC power and conduit to a junction box located in the ceiling adjacent to each terminal unit.

- .2 120 VAC normal power panels labeled "RP" with spaces available for use.
- .3 120 VAC emergency power panels labeled "ERP" with spaces available for use.
- .3 Termination at Packaged Equipment and Systems:
  - .1 Terminate wiring at packaged equipment and system controllers provided under Division 23.
  - .2 For equipment or systems panels provided under other Divisions of the Work, pull wire into control panel as per OEM manufacturer's instructions. Final termination at equipment or panel will be by the trade Contractor providing/installing the equipment.

### 3.8 **WIRING**

- .1 Maximum Control Voltage: 120 V.
- .2 Supply, install and connect power transformers as required for each system.
- .3 Sizing of conduit and selection of size and type of wire is by the Contractor under this Section of the Work.
- .4 Flexible Metal and Liquid Tight Conduit
  - .1 Maximum 1000 mm length
  - .2 Minimum size: 20 mm.
  - .3 Supported at each end.
- .5 Control and Status Relays
  - .1 Provide relays in designated enclosures only. Relays may be installed within packaged equipment control panels.
  - .2 Do not install relays within motor starter enclosures. Install relays in spare MCC sections, or provide a NEMA 1 (4) (12) enclosure mounted adjacent to the MCC or starter.
- .6 Control and interlock wiring: comply with Electrical Safety Code and Division 26, and as specified herein.
- .7 Wire
  - .1 All cables ULC listed for application
  - .2 Exposed cable in ceiling plenums: FT6 plenum rated.
- .8 Conduit
  - .1 Wiring in ceiling plenum spaces to be in conduit or be FT6 plenum rated cable.
  - .2 Wiring in all other areas to be in conduit.
  - .3 Wiring for rated smoke venting/control system to be FT6 plenum rated cable AND be installed conduit.
- .9 Sleeves
  - .1 Provide wall sleeves for plenum rated cable passing through walls.

- .2 Maintain fire rating at all penetrations.

### 3.9 **FIBRE OPTIC CABLE SYSTEM**

- .1 Install cable to maintain the minimum cable and unjacked fiber bend radii as specified by the manufacturer.
- .2 Do not exceed maximum pulling tensions as specified by the manufacturer. Do not exceed manufacturer's ratings for post installation residual cable tension.
- .3 Install fiber optic cabinets, hardware and cable entering the cabinet as per manufacturer's instructions.

### 3.10 **ARCHITECTURE**

- .1 Refer to drawings for system architecture schematic. The system architecture shown provides a general summary of the design intent and does not show all control devices.
  - .1 Obtain a CAD design file from the Consultant and complete the development of the system architecture drawing. In the absence of a design architecture, provide an architecture drawing as required.
  - .2 Include on the architecture drawing the following:
    - .1 Operator work stations
    - .2 Building LAN network
    - .3 Field LAN network
    - .4 NAE, NCE and BCU, with identification label, and room location.
    - .5 FAC, FEC and ECU, with identification label, and room location.
    - .6 LAN system repeaters.
- .2 Controllers
  - .1 Provide a separate FEC for each piece of major equipment.
  - .2 Provide a separate FAC for each major system, including hydronic system water pumps.
  - .3 A universal programmable style FAC or FEC may be used to terminate miscellaneous I/O including system instrumentation, freestanding fans and pumps, etc. which may not form part of a more complex system.
  - .4 Select ECU's to provide a minimum of 15% spare capacity for each point type at each controller, but in no case less than 1 spare point.

### 3.11 **PROGRAMMING**

- .1 General
  - .1 Point Naming: modular description without written point index.
    - .1 Use manufacturer's standard naming convention.
  - .2 Provide programming for the system as specified and control sequence requirements. Include for additional programming necessary for the operation of the system but not specifically identified herein.

- .3 Imbed sufficient comments in programming logic to clearly describe each section of the program. Comment statements to reflect language used in the sequences of operation.
  - .4 Enter all computer programs and data files into the related computers including English descriptors, control programs, approved parameters and settings.
  - .2 Graphics
    - .1 Provide graphics for each major piece of equipment/system and for each floor plan in the building. Design CAD files will be provided to the controls Contractor for this purpose. Equipment to include:
      - .1 Air handling units with associated condensing unit
      - .2 Terminal box units
      - .3 Sump pumps
      - .4 Any integrated system including fire alarm, lighting control, security, etc.
  - .3 Reporting information
    - .1 Implement samples of the following features:
      - .1 Bar chart (four different bars on one chart)
      - .2 Curve plot (five curves on one plot)
      - .3 Trend log
      - .4 Alarm message (action taking message)
      - .5 Run time maintenance message
      - .6 Trouble action message
- 3.12 **NAMEPLATES**
- .1 Provide Nameplates
    - .1 Lamacoid type:
      - .1 On each BMS control device, indicating device number.
      - .2 On the panel front to identify each system being controlled and to identify each front mounted component.
    - .2 Laminated data card
      - .1 Field devices
      - .2 Damper actuators
      - .3 DDC terminal unit box controllers
      - .4 Automatic control valve actuators.

.2 Warning Labels

- .1 Provide plastic adhesive-backed labels, black lettering on yellow background, on each starter and equipment automatically controlled through the BMS system, as follows:

<p style="text-align: center;"><b>CAUTION</b></p> <p style="text-align: center;"><b>This equipment is operating under automatic control and may start at any time without warning.</b></p>
--

- .2 Securely fasten Lamacoid nameplates to the equipment or adjacent to the equipment, with round-head cadmium plated steel self-tapping screws.

3.13 **OPERATING INSTRUCTIONS**

- .1 Provide the services of a competent technician qualified to instruct the operating personnel in maintenance and operating procedures, after commissioning, for a period of not less than one day. Training to include:
- .1 Overall operational program.
  - .2 Equipment functions.
  - .3 Commands.
  - .4 Graphics generation.
  - .5 Appropriate operator intervention following system's operation.
- .2 Provide Operating instructions for the control system in accordance with this Section and include a description of the sequence of operation and reproducible drawings of the "as-built" system schematics.
- .3 Maintain CD-R copies of all data file and application software for reload use in the event of a system crash or memory failure. Delivery one copy to the Owner during training sessions, and archive one copy in the control manufacturer's local software vault.
- .4 "As-built" system schematics:
- .1 Changes made during construction.
  - .2 Component final set points.
  - .3 Controller sensitivity and authority settings.
  - .4 Include maintenance instructions for control components supplied under this Section.

3.14 **ADJUSTMENT AND DEMONSTRATION OF SYSTEMS**

- .1 After completion of the installation, regulate and adjust all sensors, motors and other equipment provided under this contract and place them in complete operating condition. Coordinate this work with the Mechanical Contractor and system balancing technicians.
- .2 During the balancing and adjustment of the heating and ventilation systems, assist the Mechanical Contractor and system balancing technicians in the complete balancing of the systems.
- .3 After this work is completed, advise the Consultant in writing that the installation is complete and ready for inspection.

3.15 **TESTING AND REPORTING**

- .1 Conduct complete performance tests to demonstrate to the Consultant the correct operation of each individual control system and each item of control equipment. Repeat performance tests as necessary until all systems are proven satisfactory.
- .2 Report Format
  - .1 Prepare test forms in MS Excel, Word, Access or other Database format.
  - .2 Include the following header information for each test report:
    - .1 Owner Name
    - .2 Project Name
    - .3 Contractor Name
    - .4 Consultant Name
    - .5 Name of Test Report
  - .3 Include the following on the front sheet of the consolidated report:
    - .1 Contractor Company Name
    - .2 Name and signature of the person submitting the report.
    - .3 Date of report
    - .4 The following statement: *"The undersigned certifies that the test results recorded in this report are correct, and that results have been witnessed by the trade responsible for the test".*
  - .4 Submit the above tests in a hardcopy form, separately bound from the Operations and Maintenance manuals, and in Adobe Acrobat PDF format, in accordance with Section 01 33 00.
- .3 Controls Report
  - .1 Provide a test report in spreadsheet format which summarizes the following data for each piece of controls operation.
    - .1 Equipment ID and name.
    - .2 Device Location.
    - .3 ECU reference.
    - .4 BCU reference.
    - .5 I/O reference.
  - .2 Record the following tests for each device as applicable:
    - .1 Communications Loop Integrity Test.
    - .2 Sensor Range Test
    - .3 Actuator Stroke Test
    - .4 Controls logic function test – single loop.

- .5 Controls logic function test – equipment or system test.
- .3 Communications Loop Integrity Test
  - .1 Check communications between DDC controller and remote I/O device.
- .4 Sensor Range Calibration Test
  - .1 Provide data for minimum and maximum sensor values, setpoint value and current value at time of test.
- .5 Actuator Stroke Test
  - .1 Provide data on actuator stroke from 0-100% full stroke.
  - .2 Indicate output value vs. actuator position (i.e. 20 mA = 100% open).
- .6 Controls Logic Function Test – Single Loop
  - .1 Two position actuators: use manual control function from operator's workstation to change current state of controller output
  - .2 Modulating valves: Vary Setpoint of control variable to modulate valve from 0-100% opening, at nominal 25% increments.
- .7 Controls Logic Function Test – Equipment or System Test
  - .1 Create a point form checklist of the Sequence of Operation for each system.
  - .2 Operate system through each control sequence element specified.
  - .3 Operate each system through an actual power outage, and restart on power resumption.
  - .4 Operate each applicable system for automatic restart on emergency power.
  - .5 Operate each system through scheduled operation.

### 3.16 **COMMISSIONING ASSISTANCE**

- .1 Provide fifteen days of eight hours each (net of travel time) after Substantial Performance for on-site programming in conjunction with the Owner's commissioning agent.
- .2 Perform commissioning of the controls system in accordance with Section 25 05 00.

### 3.17 **SERVICE AND GUARANTEE**

- .1 The controls systems herein specified shall be free from defects in workmanship and material under normal use and service after commissioning and acceptance of the complete control system.
- .2 After acceptance of the systems by the Consultant, provide any service required for the proper performance of the control systems for a period of one year or one complete heating and cooling cycle.
- .3 This service shall include readjustment of the controls for proper balance of the systems under the direction of the testing and balancing firm six months after the initial adjustment. The controls shall be adjusted and set for optimum performance under the changed operating conditions during this system rebalancing.

- .4 Include replacement parts for defective components and any labour to remove and replace such parts at no cost to the Owner.

### 3.18 **SENSOR AND SWITCHES**

#### .1 Duct installation

- .1 Do not mount in dead air space
- .2 Thermally isolate elements from brackets and supports so as to respond to air temperature only.
- .3 Support sensor element independently from coils and filter racks.

#### .2 Averaging Duct Type Sensor Switch

- .1 Sensor length: not less than 1000 mm for each square meter of duct cross-sectional area.
- .2 Wire multiple sensors in parallel for freeze protection applications.
- .3 Wire multiple sensors separately for temperature measurement.

#### .3 High Limit Controls

##### .1 Coverage

- .1 Provide a temperature sensitive head for approximately every 1.5 sw. m of duct cross sectional area.
- .2 Install heads in a staggered arrangement to give complete coverage of the duct.

#### .4 Low Limit Controls

##### .1 Coverage:

- .1 String horizontally across the full width of duct or coil with runs at a maximum of 300 mm centres.
- .2 Where one control is insufficient to provide the specified coverage, provide two or more controls to be wired in series.
- .3 Coordinate with other trades so that the capillary does not obstruct access from access openings or doors to other duct mounted equipment.
- .4 Coordinate with other trades so that the capillary does not obstruct access from access openings or doors to other duct mounted equipment.

#### .5 Airflow Stations

- .1 Locate airflow stations in accordance with manufacturer's guidelines so as to approach ideal laboratory conditions.
- .2 Cap off manifold until cleaning of ducts is complete.

#### .6 Pressure and Differential Switches

- .1 Install isolation valve and snubber between sensor and pressure source.
- .2 Protect sensing elements on steam and high temperature greater than 98°C with pigtail syphon between valve and sensor.

End of Section

(THIS PAGE INTENTIONALLY LEFT BLANK)

- 
- 1 General
  - 1.1 **SUMMARY**
    - .1 Section Includes
      - .1 Labour, Products, equipment and services necessary to complete the Work of this section.
  - 1.2 **CODES, PERMITS AND INSPECTIONS**
    - .1 Applicable Codes
      - .1 Ontario Electrical Safety Code
      - .2 Ontario Building Code
      - .3 Ontario Fire Code
    - .2 Comply with Ontario Electrical Safety Code, all local, provincial and federal laws, where applicable and with authorities having jurisdiction. Make any changes or alterations required by authorized inspector of authority having jurisdiction.
    - .3 Equipment and material must be acceptable to Electrical Safety Authority.
    - .4 Where materials are specified which require special inspection and approval, obtain such approval for the particular installation with the cooperation of the material Supplier.
    - .5 Obtain and pay for permits and inspections required for work performed.
    - .6 Supply and install warning signs, nameplates and glass covered single line diagrams as required by Electrical Safety Authority.
    - .7 Submit required documents and Shop Drawings to authorities having jurisdiction in order to obtain approval for the Work. Copies of Contract Drawings and Specifications may be used for this purpose.
  - 1.3 **REFERENCE STANDARDS**
    - .1 These Specifications supplement the referenced standards.
    - .2 Where standards differ between authorities, the most rigid apply.
    - .3 Where requirements of the Specifications exceed referenced standards, the Specifications apply.
  - 1.4 **COORDINATION**
    - .1 Refer to and comply with Section 01 10 00.
    - .2 Carefully examine Work and Drawings of all related trades and thoroughly plan the Work so as to avoid interferences. Report defects which would adversely affect the Work. Do not commence installation until such defects have been corrected.
    - .3 Coordinate Work of this division such that items will properly interface with Work of other divisions.
    - .4 Architectural Drawings, or in the absence of Architectural Drawings, Mechanical Drawings govern all locations.
-

- .5 Coordinate work of this division with Division 21 to ensure that damage does not occur to the fireproofing work of Division 21.

#### 1.5 **SUBSTITUTIONS**

- .1 When only one manufacturer's catalogued trade name is specified, provide only that catalogued trade name, material or Product.
- .2 When more than one manufacturer's trade name is specified for a material or Product, the choice is the bidders.
- .3 No substitution is allowed upon award of Contract.

#### 1.6 **DIMENSIONS AND QUANTITIES**

- .1 Dimensions shown on Drawings are approximate. Verify dimensions by reference to Shop Drawings and field measurement.
- .2 Quantities or lengths indicated in Contract Documents are approximate only and shall not be held to gauge or limit the Work.
- .3 Make necessary changes or additions to routing of conduit, cables, cable trays, and the like to accommodate structural, mechanical and architectural conditions. Where raceways are shown diagrammatically run them parallel to building column lines.

#### 1.7 **EQUIPMENT LOCATIONS**

- .1 Devices, fixtures and outlets may be relocated, prior to installation, from the location shown on the Contract Drawings, to a maximum distance of 3 m, without adjustment to Contract Price.
- .2 Switch, control device and outlet locations are shown diagrammatically.

#### 1.8 **INSTALLATION DRAWINGS**

- .1 Prepare Installation Drawings for equipment, based upon approved Vendor Drawings, to check required code clearances, raceway, busway and cable entries, sizing of housekeeping pads and structure openings. Submit Installation Drawings to Consultant for review.

#### 1.9 **"AS BUILT" RECORD DRAWINGS**

- .1 (Refer to and comply with Section 01 33 00.) Maintain a set of Contract Drawings on site and record all deviations from the Contract Documents. **As a mandatory requirement, recording must be done on the same day deviation is made. Be responsible for full compliance with this requirement.**
- .2 Mark locations of feeder conduits, junction and terminal boxes and ducts or conduits run underground either below the building or outside the building.
- .3 Where conduit and wiring are underground or underfloor, furnish field dimension with respect to building column lines and inverts with respect to finished floor levels or grades.
- .4 Record deviations from branch circuit numbers shown on Drawings.
- .5 Prepare diagrams of interconnecting wiring between items of equipment including equipment supplied by Owner and under other Specification sections.

#### 1.10 **SINGLE LINE DIAGRAM**

- .1 Reproduce this diagram in drawing form under glazed frame and mount in main switchgear room. Provide a copy of this diagram to the Consultant and include in the Maintenance Manuals.

#### 1.11 **TEST REPORTS**

- .1 For each check and test performed prepare and submit a test report, signed by the Test Engineer, and where witnessed, by the Consultant.
- .2 Include record of all tests performed, methods of calculation, date and time of test, ambient conditions, names of testing company, Test Engineer, witnesses; also calibration record of all test instruments used together with manufacturers name, serial number and model number.
- .3 Include calibration record, percentage error and applicable correction factors.
- .4 Submit a certified test report from each manufacturer, signed by the certifying inspector, confirming correct installation and operation of each Product and part of Work. Include name of certifying inspector, date and times of inspection, ambient conditions.

#### 1.12 **SHOP (VENDOR) DRAWINGS AND PARTS LISTS**

- .1 Refer to and comply with Section 01 33 00.
- .2 Submit for review, manufacturer's or vendor's drawings for all Products being furnished except cable (up to 1000V), wire and conduit. Include rating, performance, specification sheets, descriptive literature, schematic and wiring diagrams, dimensional layouts and weights of components as well as complete assembly.
- .3 Drawings for equipment assemblies, such as switchgear and unit substations, must include the entire assembly on a single drawing having a minimum size of 420 mm x 594 mm.

#### 1.13 **FACTORY WITNESS TESTS**

- .1 Prior to Consultant attendance at factory for witness testing, perform the following:
  - .1 Successfully conduct test to be witnessed.
  - .2 Following successful testing, inform the Consultant, in writing, that tests to be witnessed have been successfully performed.

#### 1.14 **OPERATING AND MAINTENANCE MANUALS**

- .1 Refer to and comply with Section 01 33 00 and related sections.

#### 2 **Products**

##### 2.1 **APPROVALS AND QUALITY**

- .1 Provide new materials bearing certification marks or labels acceptable under Ontario Electrical Safety Code.
- .2 Equipment must bear, on manufacturer's label, certification mark or label acceptable under Electrical Safety Authority.
- .3 Provide units of same manufacture where two or more units of same class or type of equipment are required.

- .4 Manufacturer's names are stated in this Specification to establish a definite basis for tender submission and to clearly describe the quality of Product that is desired for the Work.

## 2.2 **STANDARD SPECIFICATIONS**

- .1 Ensure that the chemical and physical properties, design, performance characteristics and methods of construction of all Products provided comply with latest issue of applicable standard Specifications issued by authorities having jurisdiction, but such standard Specifications shall not be applied to decrease the quality of workmanship, Products and services required by the Contract Documents.

## 2.3 **SPRINKLER PROOF EQUIPMENT**

- .1 Ensure that electrical equipment installed in electrical rooms and other areas containing sprinklers is constructed such that exposure to water from the sprinkler heads does not impair the effectiveness of the enclosed equipment.
- .2 Provide a separate cover or roof on all 2285 mm high equipment. Provide an overhang at the front, rear and sides to effectively prevent the entrance of water either at the top or through projecting faceplates, meters, etc.
- .3 Where penetrations are made in drip shields, flash and seal using manufacturer's approved caulking to maintain drip shield integrity.
- .4 Ensure that enclosure louvres are of outdoor design such that falling water or water running down the sides will not enter the enclosure.
- .5 Where enclosure openings in the top or sides are required for outgoing conduits, provide waterproof conduit fittings.
- .6 Provide panels and transformers with hoods.
- .7 Provide sprinkler proof busways.
- .8 In electrical rooms containing sprinklers provide wall mounted equipment such as pull boxes, junction boxes, splitter troughs, wireways, auxiliary gutters, cable troughs and disconnect switches located below the level of the sprinkler heads with the following accessories:
  - .1 Gaskets on doors and drip shields on equipment, panelboards, panels and enclosures.
  - .2 Louvres facing outward and downward where openings are required for heat dissipation. Expanded metal screening is not acceptable.

## 2.4 **HOUSEKEEPING PADS**

- .1 Provide 100 mm high concrete pads under floor mounted electrical equipment. Extend pads 50 mm outside the equipment perimeter.

## 2.5 **FIRE BARRIERS**

- .1 Where electrical material or devices pass through fire rated separations, make penetrations and provide fire barrier seals with a fire resistance rating equivalent to the rating of the separation.
- .2 Prior to installation, submit for review, proposed fire barrier seal materials, method of installation and ULC system number.

- .3 Acceptable Manufacturers:
  - .1 A/D Fire Protection Systems
  - .2 Dow Corning
  - .3 Fire Stop Systems
  - .4 IPC Flamesafe Firestop
  - .5 Nelson Electric
  - .6 3M
  - .7 Tremco
- 2.6 **MISCELLANEOUS METAL FABRICATIONS**
  - .1 Provide miscellaneous structural supports, platforms, braces, brackets and preformed channel struts necessary for suspension, attachment or support of electrical equipment in accordance with Section 05 50 00.
- 2.7 **SILICONE**
  - .1 Products and materials containing silicone are not permitted.
  - .2 Refer to and comply with Section 01 61 05.
- 2.8 **EQUIPMENT COLOUR CODING**
  - .1 Exterior finish paint colour for switchgear, control panels, panelboards and devices on emergency and UPS systems:
    - .1 Emergency systems: Red
    - .2 UPS systems: Blue
- 2.9 **PRODUCTS FURNISHED BY OWNER**
  - .1 Refer to Sections 00 21 00, 00 41 13, and 01 10 00.
  - .2 Carefully examine the Vendor or Manufacturers' Drawings and provide any incidental and miscellaneous materials, mounting hardware and supports required for complete systems.
- 3 Execution
- 3.1 **MANUFACTURER'S ATTENDANCE**
  - .1 Provide manufacturer's representatives to initially start-up each part of the Work, as specified, to check, adjust, calibrate and balance as applicable all components including controls and field wiring. Provide these services for such period and for as many visits as necessary to achieve complete working order in the subject Work.
- 3.2 **FIELD INSPECTION**
  - .1 Provide Field Engineer for inspection and certification of equipment during installation, testing and commissioning as required.
- 3.3 **PAINTING**

- .1 Touch up finishes on electrical equipment found to be marred on completion of the Work using same colour and type of finish as originally used.
- .2 Prime paint field fabricated metalwork.
- .3 Other painting will be provided under Section 09 91 00.

3.4 **CORE DRILLING**

- .1 Core Drilling Procedure
  - .1 Examine locations to be core drilled where:
    - .1 Diameter is greater than 25 mm
    - .2 Multiple drillings required and where the distance between centres is less than ten times the diameter of the hole
  - .2 Examine by most suitable method including:
    - .1 X-ray
    - .2 Ferro scan
    - .3 Cable detection
  - .3 Examine from both sides of the structure to be drilled.
  - .4 Examine proposed core drilling locations to determine:
    - .1 Possible interference with
      - .1 Services
      - .2 Structural components
    - .2 Possible presence of asbestos tile or other asbestos based material. Report any occurrence or suspected occurrence to the Consultant immediately.
  - .5 Select locations as suitable for core drilling and label them:
    - .1 Uniquely number each drilling location and core so that markings will be legible after drilling
    - .2 Mark each core with a north pointing arrow where drilling a slab or upward pointing arrow where drilling a wall
  - .6 Without interfering with or damaging any services or structural elements, drill pilot holes sufficient to verify location of potential obstructions or for alignment purposes.
  - .7 Use impact drill when drilling holes of 25 mm diameter or less. For holes of greater diameter use core drill.
  - .8 Prepare report showing intended core drill locations including printouts and X-ray images. Prior to drilling submit the report to Consultant for approval.
  - .9 Proceed with core drilling only after approval has been received from Consultant.
  - .10 Confine drilling operation to time-of-day as stipulated by Consultant.

- .11 Position suitable warning notices of a type acceptable to Consultant and exercise caution to ensure safety and protection of personnel and property during drilling especially from effects of water, dust damage, or falling objects below the slab or behind the wall being drilled.
- .12 Stop drilling immediately, and report to Consultant, if contact is made with foreign objects such as reinforcing steel (rebar), electrical conduit, water pipes, drainage pipes.
- .13 Cover open holes with secured covers to guard against fall through of objects.
- .14 Provide necessary firestopping, temporary or otherwise, sufficient to firestop holes that would be otherwise open during hours that the location is unattended. Coordinate placement of firestopping with Consultant.
- .15 Store all cores or core fragments on site and make them available for inspection by Consultant. Dispose of the cores or core fragments after permission is received from Consultant.

- .46 SSPC - Steel Structures Painting Council, "Steel Structures Painting Manual, Vol. 2"

1.3 **SUBMITTALS**

- .1 Consultant reserves the right to require Contractor to submit samples of any materials to be used in this Project.

2 Products

2.1 **WIRE - LOW VOLTAGE UP TO 1000V SERVICE**

.1 Conductors

- .1 ASTM Class B, soft drawn, electrolytic copper  
.2 Stranded

.2 Insulation

- .1 CSA type RW90 XLPE (-40°C)  
.1 Heat and moisture resistant  
.2 Low temperature, chemically cross-linked thermosetting polyethylene material  
.3 600 V rated  
.4 For maximum 90°C (194°F) conductor temperature  
.5 For installation at minimum -40°C (-40°F) temperature  
.6 To CSA C22.2 No. 38  
.2 CSA type RWU90 XLPE (-40°C):  
.1 Heat and moisture resistant  
.2 Low temperature, chemically cross-linked thermosetting polyethylene material  
.3 1000 V rated  
.4 For maximum 90°C (194°F) conductor temperature  
.5 For installation at minimum -40°C (-40°F)  
.6 To CSA C22.2 No. 38  
.3 CSA type T90 NYLON (-10°C):  
.1 Heat resistant  
.2 Flame retardant  
.3 Thermoplastic PVC material with extruded nylon cover  
.4 600 V rated

- .5 For maximum 90°C (194°F) conductor temperature dry and 75°C in wet locations
      - .6 For installation at minimum -10°C (14°F)
      - .7 To CSA C22.2 No. 75-M
    - .4 CSA type TEW:
      - .1 Heat resistant
      - .2 600 V rated
      - .3 For maximum 105°C (221°F) conductor temperature
      - .4 To CSA C22.2 No. 127
    - .5 CSA type SEW-2
      - .1 Heat resistant
      - .2 600 V rated
      - .3 For maximum 200°C (392°F) conductor temperature
      - .4 To CSA C22.2 No. 127
  - .3 Acceptable Manufacturers
    - .1 Alcan Cable
    - .2 Alcatel Canada Wire
    - .3 Pirelli Cables
- 2.2 **CABLE - LOW VOLTAGE UP TO 1000V SERVICE**
  - .1 CSA Type AC90 XLPE (-40°C)
    - .1 Conductors
      - .1 ASTM Class B, soft drawn, electrolytic copper
      - .2 Solid for sizes #10 AWG and smaller
      - .3 Stranded for sizes #8 AWG and larger
    - .2 Insulation
      - .1 Heat and moisture resistant
      - .2 Low temperature, chemically cross-linked thermosetting polyethylene material
      - .3 600 V rated for sizes #10 AWG and smaller
      - .4 1000 V rated for sizes #8 AWG and larger
      - .5 For maximum 90°C (194°F) conductor temperature
      - .6 For installation at minimum -40°C (-40°F) temperature

- .7 To CSA C22.2 No. 38
- .3 Construction
  - .1 Two, three or four insulated conductors
  - .2 Bare ground conductor
  - .3 Overall interlocking aluminum armour
  - .4 To CSA C22.2 No. 51
- .4 Acceptable Manufacturers
  - .1 Alcan Cable
  - .2 Alcatel Canada Wire
  - .3 Pirelli Cables
- .2 CSA Type TECK90 (-40°C)
  - .1 Conductors
    - .1 ASTM Class B, soft drawn, electrolytic copper
    - .2 Stranded
  - .2 Insulation
    - .1 Heat and moisture resistant
    - .2 Low temperature, chemically cross-linked thermosetting polyethylene material
    - .3 600 V or 1000 V rated
    - .4 For maximum 90°C (194°F) conductor temperature
    - .5 For installation at minimum -40°C (-40°F) temperature
    - .6 CSA type RW90 XLPE
    - .7 To CSA C22.2 No. 38
  - .3 Construction
    - .1 One or more insulated conductors
    - .2 Bare, stranded, copper ground conductor for multi-conductor cables
    - .3 Bare, solid, served copper ground conductors for single conductor cables
    - .4 Fillers with binder tape to produce a circular cross-section for multi-conductor cables
    - .5 Power cables
      - .1 One, two, three or four conductors
      - .2 Conductors 1000 V rated

- .6 Control cables
  - .1 Two or more conductors
  - .2 Conductors 600 V rated
- .7 Composite cables
  - .1 Three power conductors
  - .2 Three #14 AWG control conductors
  - .3 Conductors 600V rated
- .8 Extruded PVC inner jacket over conductor assembly
- .9 Interlocking aluminum armour over inner jacket
- .10 Extruded PVC overall jacket over armour
  - .1 FT4 flame test rated
  - .2 Colour black unless otherwise indicated
- .11 Cable assembly for installation at minimum -40°C (-40°F) temperature
- .12 To CSA C22.2 No. 131 and CSA C22.2 No. 174
- .4 Acceptable Manufacturers
  - .1 Alcan Cable
  - .2 Alcatel Canada Wire
  - .3 BICC Phillips
  - .4 Pirelli Cables
- .3 CSA Type RA90 XLPE (-40°C)
  - .1 Conductors
    - .1 ASTM Class B, soft drawn, electrolytic copper
    - OR
    - .2 CSA type ACM aluminum alloy
    - .3 Stranded
  - .2 Insulation
    - .1 Heat and moisture resistant
    - .2 Low temperature, chemically cross-linked thermosetting polyethylene material
    - .3 600 V rated
    - .4 For maximum 90°C (194°F) conductor temperature
    - .5 For installation at minimum -40°C (-40°F) temperature

- .6 CSA type RW90 XLPE
    - .7 To CSA C22.2 No. 38
  - .3 Construction
    - .1 Single conductor
    - .2 Continuous, corrugated aluminum sheath of minimum cross-sectional area to comply with electrical code table 16
    - .3 Extruded PVC overall jacket over armour
      - .1 FT4 flame test rated
      - .2 Colour black unless otherwise indicated
    - .4 Cable assembly for installation at minimum -40°C (-40°F) temperature
    - .5 To CSA C22.2 No. 123 and CSA C22.2 No. 174
  - .4 Acceptable Manufacturers
    - .1 Alcan Cable
    - .2 Alcatel Canada Wire
    - .3 BICC Phillips
- .4 CSA Type TC, Tray Cable (-40°C)
  - .1 Conductors
    - .1 ASTM Class B, soft drawn, electrolytic copper
    - .2 Stranded
  - .2 Insulation
    - .1 Heat and moisture resistant
    - .2 Low temperature, chemically cross-linked thermosetting polyethylene material
    - .3 600 V rated
    - .4 For maximum 90°C (194°F) conductor temperature
    - .5 For installation at minimum -40°C (-40°F) temperature
    - .6 CSA type RW90 XLPE to CSA C22.2 No. 38
  - .3 Construction
    - .1 Two or more insulated conductors
    - .2 Bare, stranded, copper ground conductor
    - .3 Fillers with binder tape to produce a circular cross-section
    - .4 Jacket

- .1 PVC
    - .2 FT4 flame test rated
    - .3 Low acid gas rated to CSA C22.2 No. 0.3
    - .4 Black colour
    - .5 To CSA C22.2 No. 230
  - .4 Acceptable Manufacturers
    - .1 Alcatel Canada Wire
    - .2 BICC Phillips
    - .3 Pirelli Cables
- .5 CSA Type MI
  - .1 Conductors
    - .1 ASTM Class B, soft drawn, electrolytic copper
    - .2 Solid
  - .2 Insulation
    - .1 Powdered magnesium oxide
    - .2 600 V rated
  - .3 Construction
    - .1 Solid conductor
    - .2 Insulation around the conductor compressed to form a solid, homogeneous mass between the conductor and the metal sheath throughout the entire length of cable
    - .3 Soft annealed seamless copper sheath over insulation
    - .4 Extruded PVC overall jacket over sheath
      - .1 FT4 flame test rated
      - .2 Colour black unless otherwise indicated
    - .5 To CSA C22.1 No. 124-M
  - .4 Acceptable Manufacturer
    - .1 Pyrotenax
- .6 EMF-Free Power Cable
  - .1 Conductors
    - .1 ASTM Class B, soft drawn, electrolytic copper
    - .2 Stranded central conductor

- .3 Solid, served concentric return conductors, equivalent to central conductor
- .4 Conductor size and number of runs to suit feeder ratings as shown on drawings
- .2 Insulation
  - .1 Heat and moisture resistant
  - .2 Ethylene propylene rubber (EPR)
  - .3 Minimum 600 V rated
  - .4 For maximum 90°C (194°F) conductor temperature
  - .5 For installation at minimum -40°C (-40°F) temperature
  - .6 To CSA C22.2 No. 38
- .3 Construction
  - .1 Single conductor with served wire return conductor (coaxial)
  - .2 PVC inner-jacket over return conductor
  - .3 Interlocking aluminum over inner jacket
  - .4 Overall PVC jacket
- .4 Power filters
  - .1 Filter parameters to suit the feeder characteristics (rating, length, etc.)
  - .2 EEMAC type 1 enclosure
- .5 Engineered system
  - .1 Provide EMF-free power cables and power filters as a complete engineered system from the manufacturer
- .6 Acceptable Manufacturer
  - .1 United Wire & Cable (ZeroFlux® Power Cable)

## 2.3 **MODULAR WIRING (LIGHTING SYSTEMS)**

- .1 Distribution Boxes
  - .1 Steel, EEMAC 1 enclosure, minimum size 300 mm x 300 mm x 100 mm
  - .2 Modular connectors, five-wire, female
  - .3 Terminal block for incoming wiring
  - .4 Stranded copper wiring between terminal block and modular connectors
- .2 Extension/Tap Cables
  - .1 Armoured type cable, #10 or #12 AWG, copper conductors rated 600 V, 90°C (194°F) insulation

- .2 Modular connectors, five-wire, one male at one end and twin female at other end or splitters to maintain circuit continuity on removal of luminaire drop cable
  - .3 Luminaire Drop Cables
    - .1 Service cord, type SEO or armoured cable, three-wire, stranded copper conductors rated 600V, 105°C (221°F) insulation, colour phase identification on jacket (phase A, red; phase B, black; phase C, blue)
    - .2 Modular connector, male
    - .3 Prewired to luminaires
  - .4 Modular Connectors
    - .1 Rated 347 V, 20 A
    - .2 Rated to connect or disconnect an individual luminaire under load
  - .5 Acceptable Manufacturers
    - .1 Flex Systems (Flex) 3+
    - .2 Lithonia Reloc
    - .3 Holophane Holoflex
    - .4 Cooper MWS
- 2.4 **CABLE CONNECTORS**
- .1 Connectors for Type AC90 Cable
    - .1 Steel or malleable iron
    - .2 Insulated throat
    - .3 Acceptable manufacturers
      - .1 Efcor 1000B series
      - .2 Elliott 65200 series
      - .3 Thomas & Betts 3110 series
  - .2 Connectors for Type TECK90 Cable
    - .1 Copper free aluminum body
    - .2 Steel or copper free aluminum fittings and locknut
    - .3 Certified for use in hazardous locations Classes I, II, and III
    - .4 Class I hazardous location sealing fitting
    - .5 Acceptable manufacturers
      - .1 Thomas & Betts "STE" series
      - .2 Crouse-Hinds type TMC
      - .3 Commander/Iberville type TEK

- .3 Connectors for Type RA90 Cable
  - .1 Copper free aluminum body
  - .2 Steel or copper free aluminum fittings
  - .3 Acceptable manufacturers
    - .1 Alcatel Canada Wire
    - .2 Crouse-Hinds, type TMC
- .4 Connectors for Type TC, Tray Cable
  - .1 Copper free aluminum body
  - .2 Steel or copper free aluminum fittings and locknut
  - .3 Acceptable manufacturers
    - .1 Thomas & Betts, Tray-Star, HLT series
    - .2 Crouse-Hinds, type TMC

## 2.5 **WIRE AND CABLE CONNECTORS**

- .1 Copper compression type wire and cable terminations for #8 AWG and larger conductors, colour keyed, sized to suit. Long barrel NEMA 2 hole lugs for sizes #1/0 AWG and larger.
  - .1 Acceptable Manufacturers
    - .1 Thomas & Betts series 54000
    - .2 Ideal Powr-Connect
    - .3 Burndy Hylug
  - .2 Twist type splicing connectors, copper, sized to suit, with nylon or plastic shroud for tee connections in #10 AWG and smaller conductors.
    - .1 Acceptable Manufacturers
      - .1 Thomas & Betts spring type
      - .2 Ideal Twister
      - .3 Marr Marrette
  - .3 Conductor compression splice for #10 AWG or smaller.
    - .1 Acceptable Manufacturers
      - .1 Thomas & Betts STA-Kon series
      - .2 Ideal Splices
      - .3 Burndy

## 2.6 **HEAT SHRINKABLE TUBING INSULATION, HEAVY WALL**

- .1 Acceptable Manufacturers
  - .1 Thomas & Betts, Shrink-Kon series

.2 Ideal Thermo-Shrink, TS-46

.3 Raychem tubing WCSM

.4 3M cable sleeve ITCSN

**2.7 MOTOR LEAD CONNECTION KITS, 600 VOLT**

.1 Connection kits for low voltage motors.

.2 Acceptable Manufacturers

.1 3M, motor lead splice kit, pigtail, 5300 series

.2 Raychem, motor connection kit, MCK, type V

**2.8 MOTOR LEAD CONNECTION KITS, 5000 VOLT**

.1 Connection kits for 4000 V motors.

.2 Acceptable Manufacturers

.1 3M, motor lead splice kit, pigtail, 5320 series

.2 Raychem, motor connection kit, MCK-5, type V

**2.9 CONDUIT AND FITTINGS**

.1 Rigid Steel Conduit

.1 To CSA C22.2 No. 45-M

.2 Rigid thickwall galvanized steel threaded conduit

.2 Coated Steel Conduit

.1 Corrosive resistant coated rigid thickwall steel threaded conduit, CSA approved.

.2 Acceptable Manufacturers

.1 Rob Roy Plastibond PVC coated

.2 Columbex Green Guard II epoxy polyester coated

.3 Rigid PVC Conduit

.1 To CSA C22.2 No. 211.2-M

.2 Rigid PVC conduit

.4 Flexible Steel Conduit

.1 To CSA 22.2 No. 56

.2 Liquid-tight flexible steel conduit with PVC cover

.5 Non-Metallic Flexible Conduit

.1 Non-metallic extra flexible PVC conduit

.2 Acceptable Manufacturers

.1 Carlon, Carflex X-Flex

- .2 Hubbell, Polytuff Black
  - .6 Rigid Steel Conduit Fittings
    - .1 To CAN/CSA C22.2 No. 18
    - .2 Galvanized or polymer coated cast steel fittings
    - .3 Expansion fittings, watertight with integral bonding jumper suitable for linear expansion and 19 mm deflection in all directions
    - .4 Sealing condulets for hazardous areas
    - .5 Corrosive resistant coated cast steel fittings for corrosive resistant conduit
  - .7 Rigid PVC Conduit Fittings
    - .1 To CSA C22.2 No. 85-M
    - .2 Rigid PVC fittings of same manufacture as rigid PVC conduit
  - .8 Liquid Tight Flexible Steel Conduit Fittings
    - .1 Watertight connectors with nylon insulated throat
      - .1 Acceptable Manufacturers:
        - .1 T & B Series 5331 with Sealing O-ring Series 5262
        - .2 Commander/Iberville Series 6300-IT with nitrile O-ring
- 2.10 **EMT AND FITTINGS**
- .1 EMT
    - .1 To CSA C22.2 No. 83-M
    - .2 EMT galvanized cold rolled steel tubing
  - .2 EMT Fittings
    - .1 Compression type, steel
      - .1 Gland compression connectors with insulated throats
      - .2 Compression couplings
      - .3 Acceptable manufacturers:
        - .1 T & B Series 5123 & 5120
        - .2 O-Z/Gedney type ZTC series
        - .3 Commander/Iberville Series 5600-IT and 5700
    - .2 Set screw type, steel, concrete-tight
      - .1 Connectors with insulated throats
      - .2 Couplings
      - .3 Acceptable manufacturers

.1 Commander/Iberville Series 5400 and 5500

2.11 **CABLE TRAY**

.1 Cable Trays and Fittings

.1 To EEMAC F5-1

.2 To CAN/CSA C22.2 No. 126-M

.2 Ladder Type

.1 Class C1

.2 Aluminum (Steel, hot dip galvanized after fabrication)

.3 Side height, 100 mm(150 mm)

.4 Rung spacing, 300 mm

.3 Ventilated Type

.1 Class C1

.2 Aluminum (Steel, hot dip galvanized after fabrication)

.3 Side height, 100 mm(150 mm)

.4 Solid Type

.1 Class C1

.2 Aluminum (Steel, hot dip galvanized after fabrication)

.3 Side height, 100 mm(150 mm)

.5 Centre Rail Type

.1 Class C1

.2 Aluminum

.3 Rung spacing 150 mm, 225 mm, 300 mm

.4 Loading depth 75 mm, 100 mm, 150 mm

.5 Rung width 25 mm minimum

.6 Acceptable manufacturers for ladder, ventilated and solid types:

.1 B-Line

.2 Canadian Electrical Raceways

.3 Canstrut

.4 Electrotray

.5 Pilgrim

.6 Pursley

.7 Unistrut

- .7 Acceptable manufacturers for centre rail type:

- .1 Wiremold, Spec Mate CA series
- .2 B-Line, Cent-R-Rail

#### 2.12 **WIREWAY**

- .1 To CSA C22.1 No. 94-M.
- .2 Steel with hinged cover to give uninterrupted access.
- .3 Elbows, tees, couplings and hanger fittings manufactured as accessories for wireway supplied.
- .4 Acceptable Manufacturers:
  - .1 Amalgamated Electric
  - .2 Canadian Electrical Raceways
  - .3 Schneider Square D
  - .4 Pilgrim
  - .5 Pursley

#### 2.13 **SURFACE RACEWAY**

- .1 Surface metal raceway, snap-in divider to form two compartments for power and voice/data, with removable cover.
- .2 Elbows, couplings, end caps, device brackets and faceplates for power, data and voice, and fittings manufactured as accessories for wireway supplied. 120 V power receptacles and mounting only for voice/data.
- .3 Acceptable manufacturer:
  - .1 Wiremold with following components:
    - .1 4000 series, ivory colour
    - .2 Device mounting plate, V4049-G and faceplate 5507-G colour grey
    - .3 Duplex receptacles, 120V, 15A, Leviton Decora plus, colour grey 16262-GY
    - .4 Duplex receptacle, 120V, 20A, P & S Sierraplex, colour grey, 26342-GRY

#### 2.14 **CELLULAR FLOOR SYSTEM**

- .1 Standards
  - .1 Raceways and fittings to CSA C22.2 No. 79.
  - .2 Activation kits and components CSA approved.
- .2 Trench duct: Steel construction, intermittent bottom, adjustable compartment dividers, removable covers, external levelling screws, void closures, coupling mechanisms, end closures, elbows and coverplate lifting device.

- .3 Preset inserts: Steel construction, triple service access with grommetted openings for access to low tension and power cells.
- .4 Activation kits: Pedestal fitting, multiplex service, two duplex power convenience receptacles, two data receptacles, two telephone jack outlets, and fittings to connect to preset inserts.
- .5 Acceptable Manufacturer
  - .1 Walker: Trenchduct type VA, preset inserts NRG-Bloc series and activation kits M6 series

## 2.15 **FASTENINGS, SUPPORTS AND SLEEVES**

- .1 Fastenings
  - .1 Galvanized steel straps, beam clamps and threaded rods
- .2 Sleeves
  - .1 Schedule 40 steel pipe, minimum I.D. 13 mm larger than outside diameter of conduit or cable passing through.
- .3 Strut
  - .1 Continuous slotted channel
  - .2 Twelve gauge pre-galvanized steel
  - .3 41.2 mm x 41.2 mm minimum
  - .4 Acceptable manufacturers:
    - .1 B-Line
    - .2 Pilgrim
    - .3 Pursley
    - .4 Unistrut

## 2.16 **SPLITTER BOXES**

- .1 Code gauge (galvanized) sheet steel enclosure EEMAC Type (1) (4) (12) welded corners and formed hinged cover suitable for locking in closed position.
- .2 Cast steel enclosure EEMAC 7 (9) with gasketed bolt on cover for hazardous locations.
- .3 Copper (aluminum) main and branch lugs to match required size and number of incoming and outgoing conductors.
- .4 At least three spare terminals on each set of lugs in splitters less than 400 A.

## 2.17 **JUNCTION BOXES**

- .1 Galvanized steel EEMAC Type 1 (4) (12) size as required by code for number and size of conduits, conductors and devices, complete with covers, corrosion resistant screws, terminal blocks and mounting rails.
- .2 Screw-on sheet steel covers to match enclosure for surface mounting boxes.
- .3 Covers with 25 mm minimum extension around for flush-mounted junction boxes.

- .4 Galvanized steel barriers as required.

#### 2.18 **TERMINAL BLOCKS - SURGE PROTECTION**

- .1 Terminal blocks, rail mounted, with surge voltage protection, rated for circuit voltage.
- .2 Acceptable Manufacturers
  - .1 Phoenix Contact Termitrab SLKK5 (Termitrab SLKK5-F) (TT-SLKK5-S).

#### 2.19 **PULL BOXES**

- .1 Galvanized sheet steel welded construction, EEMAC Type 1, (4) (12).
- .2 Screw-on galvanized sheet steel covers for surface mounting boxes.
- .3 Covers with 25 mm minimum extension around, for flush mounted pull boxes.
- .4 Galvanized steel barriers as required.

#### 2.20 **CONDUIT BOXES - GENERAL**

- .1 Boxes for EMT
  - .1 Galvanized pressed steel
- .2 Boxes for Rigid Steel Conduit
  - .1 Galvanized cast iron alloy FS boxes with mounting feet for surface mounted switches and receptacles
  - .2 Gasketed cover plate for exterior location
  - .3 For corrosive resistant coated conduit: Cast boxes with same finish as conduit
- .3 Boxes for Rigid PVC Conduit
  - .1 PVC boxes

#### 2.21 **OUTLET BOXES - SHEET STEEL**

- .1 Pressed steel single and multi-gang flush device boxes, minimum size 100 mm x 50 mm x 38 mm. 100 mm square outlet boxes where more than one conduit enters one side, with extension rings as required.
- .2 100 mm square or octagonal outlet boxes.
- .3 119 mm square outlet boxes with extension and plaster rings as necessary for flush mounting devices in gypsum board, plaster or panelled walls.

#### 2.22 **MASONRY BOXES**

- .1 Pressed steel masonry single and multi-gang boxes for devices flush mounted in exposed masonry walls with extension and plaster rings as required.

#### 2.23 **CONCRETE BOXES**

- .1 Pressed steel concrete type boxes for flush mount in concrete with extension and plaster rings as required.

#### 2.24 **OUTLET BOXES - FITTINGS**

- .1 Bushings and connectors with nylon insulated throats.
- .2 Knock-out fillers to prevent entry of foreign materials.
- .3 Double locknuts and insulated bushings for sheet steel metal boxes.

#### 2.25 **WIRING DEVICES - SWITCHES**

- .1 Specification grade, general purpose AC switches, manual toggle operated, (white), (ivory) and (brown) colour, 15 A, 20 A, 120-277 V, 347 V, single pole, double pole, three-way, four-way switches as required.
- .2 Acceptable Manufacturers:
  - .1 Hubbell - HBL1201 Series: HBL1221 Series: HBL18201 Series: HBL 18221 Series
  - .2 P & S - 15AC Series: 20AC Series: 370000 Series
  - .3 Arrow Hart - 1891 Series: 1991 Series: 18201 Series: 18221 Series
- .3 Specification grade, general purpose AC switches, manual rocker operated, (white), (ivory) colour, 15 A, 20 A, 120-277 V, 347 V, single pole, double pole, three-way, four-way switches as required.
- .4 Acceptable Manufacturers
  - .1 Bryant, 120-277V, Fashion Series 9000
  - .2 Hubbell, 120-277V, Style Line 2100 Series
  - .3 Leviton, 120-277V and 347V, Decora Plus 5600 Series
  - .4 Pass & Seymour, 120-277V and 347V, Sierraplex Decorator, 2600 and 2600000 Series

#### 2.26 **WIRING DEVICES - DIMMER SWITCHES**

- .1 Dimmer switches: solid state, full range with slider type handle on-off switch, (white), (ivory) rated to suit circuit load, 1000 watts minimum, 120 volts.
- .2 Acceptable Manufacturers:
  - .1 P & S
  - .2 Lutron

#### 2.27 **WIRING DEVICES - OCCUPANCY SENSORS**

- .1 W1 Automatic wall switch, passive infrared, (120V) (277V) (347V), adjustable time delay thirty seconds to thirty minutes, 180 degrees coverage, minimum 300 sq.ft. hand motion at desktop, adjustable light sensor (21-2150 lux), white.
  - .1 Wattstopper WS-250 Series
- .2 W2 Automatic wall switch, passive infrared, (120V) (277V) (347V), adjustable time delay five minutes to thirty minutes, manual or auto on, 180 degrees coverage, minimum 300 sq.ft. hand motion at desktop, white.
  - .1 Wattstopper PW-100 Series

- .3     W2B     Automatic wall switch, passive infrared, (120V) (277V) (347V), adjustable time delay five minutes to thirty minutes, manual or auto on, dimmer, 180 degrees coverage, minimum 300 sq.ft. hand motion at desktop, white.
  - .1     Wattstopper PW-100D-I-U
- .4     W3     Automatic wall switch, dual technology, (120V) (277V) (347V), adjustable time delay five minutes to thirty minutes, manual or auto on, 180 degrees coverage, minimum 300 sq.ft. hand motion at desktop, white.
  - .1     Wattstopper DW-100
- .5     W4     Outdoor PIR Occupancy sensor lighting control to mount internal to task lighting fixtures. 360 degree High Bay lens (20'-40'), 7.5' wire lead length, 24VDC; IP65.
  - .1     Leviton OSF20-ILW
- .6     DT1     Ceiling mounted dual technology, 2000 sq.ft. coverage at 180 degrees, corner mounting bracket, adjustable time delay, adjustable sensitivity, built-in light level sensor (20 to 2150 lux), (120V/20A) (277V/20A) (347V/15A) power packs/slave packs as required, white.
  - .1     Wattstopper DT-200
- .7     DT2     Ceiling mounted dual technology, 1000 sq.ft. coverage at 360 degrees, adjustable time delay, adjustable sensitivity, built-in light level sensor (100 to 3200 lux), (120V/20A) (277V/20A) (347V/15A) power packs/slave packs as required, white.
  - .1     Wattstopper DT-300
- .8     C1     Ceiling mounted ultrasonic, 2000 sq.ft. coverage at 360 degrees, temperature and humidity resistant receivers, logic key/on bypass, adjustable time delay fifteen seconds to fifteen minutes, (120V/20A) (277V/20A) (347V/15A) power packs/slave packs as required, white.
  - .1     Wattstopper W-2000A
- .9     C2     Ceiling mounted ultrasonic, 1000 sq.ft. coverage at 360 degrees, temperature and humidity resistant receivers, logic key/on bypass, adjustable time delay fifteen seconds to fifteen minutes, (120V/20A) (277V/20A) (347V/15A) power packs/slave packs as required, white.
  - .1     Wattstopper W-1000A
- .10    C3     Ceiling mounted ultrasonic, 500 sq.ft. coverage at 360 degrees, temperature and humidity resistant receivers, logic key/on bypass, adjustable time delay fifteen seconds to fifteen minutes, (120V/20A) (277V/20A) (347V/15A) power packs/slave packs as required, white.
  - .1     Wattstopper W-500A
- .11    C4     Ceiling mounted passive infrared, 300 sq.ft coverage, corner mounted, optional ON override through logic key/ON bypass, adjustable time delay thirty seconds to thirty minutes, (120V/20A) (277V/20A) (347V/15A) power packs/slave packs as required, white.
  - .1     Wattstopper WPIR

- .12 CH Ceiling mounted ultrasonic, 90 lin.ft. hallway coverage, temperature and humidity resistant receivers, logic key/on bypass, adjustable time delay fifteen seconds to fifteen minutes, (120V/20A) (277V/20A) (347V/15A) power packs/slave packs as required, white.

- .1 Wattstopper W-2000H

## 2.28 **WIRING DEVICES – TIME SWITCHES**

- .1 T1 (120V) (277V) digital time switch, zero crossing, pushbutton programming, adjustable time-out setting five minutes to twelve hours, flash and beep warnings, time scroll for temporary override of pre-set time-out, reset feature to return to pre-set timeout setting, electroluminescent, white.

- .1 Wattstopper TS-400

- .2 T2 24 V low voltage digital time switch, local power packs as required to suit load, zero crossing, pushbutton programming, adjustable time-out setting five minutes to twelve hours, flash and beep warnings, time scroll for temporary override of pre-set time-out, reset feature to return to pre-set timeout setting, electroluminescent, white

- .1 Wattstopper TS-400-24.

## 2.29 **WIRING DEVICES - RECEPTACLES FOR GENERAL SERVICE**

- .1 Receptacles: Specification grade suitable for back and side wiring, complete with grounding terminal. Colour as required for type of area for straight blade devices and black colour for twistlock devices.

- .2 Receptacles of one manufacturer.

- .3 Acceptable Manufacturers:

- |    |   |   |
|----|---|---|
| .1 | 15A, 125V, (5-15R) Single<br>Straight Blade       | - Arrow Hart 5261<br>- Leviton 5261<br>- Hubbell 5261<br>- Pass & Seymour 5261          |
| .2 | 15A, 125V, (5-15R) Duplex<br>Straight Blade       | - Arrow Hart 5262<br>- Leviton 5262<br>- Hubbell 5262<br>- Pass & Seymour 5262          |
| .3 | 20A, 125V, (5-20R) Single<br>Straight Blade       | - Arrow Hart 5361<br>- Leviton 5361<br>- Hubbell 6331<br>- Pass & Seymour 5361          |
| .4 | 20A, 125V, (5-20R) Duplex<br>Straight Blade       | - Arrow Hart 5392<br>- Leviton 5362<br>- Hubbell 5392<br>- Pass & Seymour 5362          |
| .5 | 15A, 125V, (5-15R) Duplex<br>GFCI, Straight Blade | - Arrow Hart GF5242AH<br>- Leviton 6599-W<br>- Hubbell GF-5252<br>- Pass & Seymour 1591 |

.6	15A, 125V, (5-15R) Duplex Isolated Ground, Straight Blade	- - - -	Arrow Hart IG5262AH Leviton 5262-IG Hubbell IG-5262 Pass & Seymour IG6200
.7	20A, 125V, (L5-20R) Single locking, 2 pole, 3 wire, grounding	- - - -	Arrow Hart 6200 Leviton 2310 Hubbell 2310ACN Pass & Seymour L520-RCN
.8	20A, 250V, (L6-20R) Single locking, 2 pole, 3 wire, grounding	- - - -	Arrow Hart 6210 Leviton 2320 Hubbell 2320ACN Pass & Seymour L620-RCN
.9	30A, 250V, (L6-30R) Single locking, 2 pole, 3 wire, grounding	- - - -	Arrow Hart 6340 Leviton 70630-FR Hubbell 2620CAN Pass & Seymour L630RCN
.10	30A, 250V, (L15-30R) Single locking, 3 pole, 4 wire, 3 phase, grounding	- - - -	Arrow Hart 6520 Leviton 2720 Hubbell 2720ACN Pass & Seymour L1530-RCN
.11	20A, 277V, (L7-20R) Single locking, 2 pole, 3 wire, grounding	- - - -	Arrow Hart 6220 Leviton 2331 Hubbell 2330ACN Pass & Seymour L720R
.12	20A, 347V (L24-20R) Single locking, 2 pole, 3 wire, grounding	- -	Leviton 3721 Pass & Seymour L3720-RCN
.13	15A, 125V (5-15R) Quad straight blade, 2 pole, 3 wire grounding	- - -	Bryant 1254 Hubbell 415 series Pass & Seymour 1254
.14	15A, 347V, (24-15R) Quad straight blade, 2 pole, 3 wire grounding	- - -	Bryant 3474W Hubbell 415347WC Pass & Seymour 3474W
.15	15A, 125V, (5-15R) Duplex straight blade	- - - -	Arrow Hart 26262 Leviton Decora Plus Hubbell 2152 series Pass & Seymour 885
.16	15A, 125V (5-15R) Duplex straight blade, 2 pole, 3 wire grounding, surge suppression, indicator light, blue (ivory) colour	- -	Arrow Hart 5250 Hubbell 5260
.17	15A, 125V (5-15R) Duplex straight blade, 2 pole, 3 wire grounding, isolated ground, surge suppression, indicator light, blue (ivory) colour	- -	Arrow Hart IG5250 Hubbell IG5262

- .1 Stainless steel Type 302 alloy, vertically brushed, 0.8 mm thick cover plates.
- .2 Nylon, smooth, high impact strength.
- .3 Pressed steel, galvanized.
- .4 Cast covers for cast boxes with gaskets.
- .5 Cover plates of same manufacture as devices.

## 2.31 **WELDING RECEPTACLES**

- .1 Circuit Breaking Receptacle
  - .1 Receptacle and back box assembly, 600 volt, 60 amp, three-wire, four-pole, weatherproof, aluminum housing.
  - .2 Acceptable Manufacturers
    - .1 Appleton Powertite, AJA mounting box and spring door
    - .2 Crouse-Hinds, Arktite AREA 6000 series, AJ back box, angle adaptor and spring door
    - .3 Russellstoll, type JRFA, twenty degree angle adaptor and spring door
  - .2 Interlocked Receptacle and Switch
    - .1 Receptacle interlocked with unfused disconnect switch, 600 volt, 60 amp, three-wire, four-pole. Receptacle with aluminum housing and spring door. Disconnect switch with NEMA 12 sheet steel enclosure.
    - .2 Acceptable Manufacturers
      - .1 Appleton WSRD interlocked receptacle
      - .2 Crouse-Hinds Arktite receptacle with WSRD disconnect switch
      - .3 Schneider Square D with Crouse-Hinds Arktite receptacle and class 3110 disconnect switch
    - .3 Compact Interlocked Receptacle and Switch
      - .1 Compact unit, receptacle interlocked with unfused disconnect switch, 600 volt, 60 amp, three-wire, four-pole, watertight, NEMA 4X non-metallic enclosure.
      - .2 Acceptable Manufacturers
        - .1 Bryant, 460SM series
        - .2 Crouse-Hinds, Arktite CSR Series
        - .3 Hubbell, Circuit-Lock

## 2.32 **SNOW MELTING SYSTEM (SELF-REGULATING CABLE)**

- .1 Copper heating cables with semi-conductive core fluoropolymer jacket, copper shield and polyolefin outer jacket. Cold leads of adequate length for each cable set so entire heated length is in concrete section to be heated. Raychem Electromelt EM2-XR.

- .2 Automatic snow detector, controller, and contactors to switch cable sets, also air temperature thermostat, and "test/off/auto" switch to control each system. Complete with kits of same manufacture for splices, seals and power connections.
- .3 Cast junction boxes for connection of heating cables to power supply from panel. Heat shrink sleeves for watertight connections.
- .4 Thermostat: Rated 20 A, 120 V, suitable for outdoor ambient monitoring. Enclosure die-cast aluminum EEMAC 4, watertight and dusttight with threaded conduit hub. Set point +3°C with a minimum adjustment of 6°C above and 3°C below setpoint.
- .5 Snow sensor, 20 A, 120 V with EEMAC 4 enclosure for electrical wiring and relay, arranged for mounting on vertical conduit.
- .6 Acceptable Manufacturer:
  - .1 Raychem, Electromelt System

2.33 **SNOW MELTING SYSTEM (MI CABLE)**

- .1 Heating cables type MI with polyethylene jacket. Cold leads, jacketed, of adequate length for each cable set so entire heated length is in concrete section to be heated.
- .2 Control panel: 120 V AC supply, two-pole contactor, hold-on timer, bypass switch for manual control and status indicators.
- .3 Heat shrink sleeves for watertight connections.
- .4 Slab sensing thermostat.
- .5 Snow sensor arranged for mounting on vertical conduit with integral ambient thermostat.
- .6 Acceptable Manufacturer
  - .1 Pyrotenax: Slab sensing thermostat model 4688-WP, control panel model APS-3 and slab sensing thermostat model 4688-WP.

2.34 **ICE MELTING CABLE SYSTEM**

- .1 System comprises ice melting cable, junction boxes, downspout hangers, heat shrinkable tubes, end seals and thermostat.
- .2 Ice melting cable: Self regulating cable rated ten watts per foot when it contacts ice and five watts per foot in air, 120 volt power supply.
- .3 Junction boxes: Steel, EEMAC type 4 or cast steel fittings.
- .4 Thermostat: 4.5°F (40°F) setpoint, rated 120V, 22A, EEMAC 4x enclosure, three foot capillary tube.
- .5 Acceptable Manufacturers
  - .1 Ice melting cable: Raychem type GM-1X
  - .2 Downspout hangers: Raychem type GMK-DH
  - .3 Thermostat: Raychem type AMC-F5

2.35 **HEAT TRACING CABLE**

- .1 120 volt copper heat tracing cables for installation (inside) (and) (on exterior of) pipes complete with line voltage thermostat with remote sensor and capillary.

- .2 Acceptable Manufacturers:

- .1 Thermon
- .2 Raychem
- .3 Pyrotenax

## 2.36 **PLYWOOD BACKBOARDS**

- .1 Plywood backboards, good one side, 1220 mm x 2440 mm x 19 mm unless indicated otherwise. Treat with primer and two coats of fire retardant paint.
- .2 Mount plywood on vertical strapping, on 40 mm centres to provide 10 mm clearance between wall and rear of plywood. Treat strapping similar to plywood.

## 2.37 **FINISH**

- .1 Equipment enclosure finish: Baked grey enamel, ANSI 49 or ANSI 61.

## 3 **Execution**

### 3.1 **WIRE AND CABLE**

- .1 Install wiring in raceways unless noted otherwise.
- .2 Minimum wire sizes:

- .1 Power and lighting - No. 12 AWG
- .2 Control - No. 14 AWG
- .3 Fire alarm - No. 18 AWG

- .3 Wire and cable application and type:

Application	Type
.1 Lighting branch circuit where connection to luminaire is AC90 cable	T90 nylon
.2 Receptacle branch circuit	T90 nylon
.3 Ceiling boxes to luminaires in suspended ceiling	T90 nylon or AC90 cable
.4 Wiring under raised floor used as plenum	AC90 cable or wire in flexible metal conduit
.5 Wiring inside high temperature equipment	TEW or SEW-2
.6 Branch circuits other than those covered above	RW90
.7 Equipment feeders, circuits	RW90
.8 Underground and under slab raceways, duct banks, direct burial	RWU90

- .4 Type AC90 cable length limitations:

- .1 Ceiling box to luminaire: 1.2 m maximum in non-accessible ceilings;  
1.8 m in accessible ceilings
- .2 Junction box to outlet: 3.6 m maximum
- .5 Load current limitations:
  - .1 Conductors rated for more than 90°C: 90°C (194°F) code ampacity rating
  - .2 Motor connection: 75°C (167°F) code ampacity rating
- .6 EMF-Free Power Cables
  - .1 Install the EMF-free power cable system in complete accordance with the manufacturer's written instructions.
  - .2 Provide a manufacturer's representative on site during installation of the system.
  - .3 At completion of the work, provide a letter from the manufacturer indicating that the system was installed to the manufacturer's satisfaction and that it is ready for use.
  - .4 Provide manufacturer's commissioning report to include the manufacturer's standard readings and specifically the following readings taken at three locations, determined by the Consultant; 1 m from the feeder and distance from the feeder where the EMF is 0.5 micro Teslas.
    - .1 Background AC and steady state (DC) EMF readings (feeder de-energized)
    - .2 EMF readings at full load, balanced  $\pm 5\%$
    - .3 EMF readings near full load with 20%  $\pm 5\%$  unbalance
  - .5 Acceptance Criterion
    - .1 The installation will be deemed not acceptable if the ac EMF is in excess of 0.5 micro Teslas above the background EMF at any point along the feeder not within 2 m of either end for all load conditions

### 3.2 **MODULAR WIRING**

- .1 Install and connect modular wiring.

### 3.3 **CONNECTORS**

- .1 Install compression terminations and splices in accordance with manufacturer's written instructions.
- .2 Make splices in junction boxes.
- .3 Make connections in lighting circuits with twist type splicing connectors.
- .4 Terminate and splice conductors No. 8 and larger at terminal blocks in junction boxes.
- .5 Seal terminations and splices exposed to moisture, corrosive conditions or mechanical abrasions with heavy wall heat shrinkable insulation.
- .6 Install fixture type connectors and tighten. Replace insulating cap.

### 3.4 **MOTOR LEAD CONNECTION KITS, 600 VOLT**

- .1 Install motor lead connection kits for low voltage motors.

### 3.5 **MOTOR LEAD CONNECTION KITS, 5000 VOLT**

- .1 Install motor lead connection kits for 4000 V motors.

### 3.6 **CONDUIT AND EMT - GENERAL**

- .1 Run parallel or perpendicular to building lines.
- .2 Group raceways wherever possible. Support on channels.
- .3 Install expansion joints as required.
- .4 Run raceways in web portion of structural steel columns and beams.
- .5 Do not drill structural members to pass through.
- .6 Locate raceways behind infrared or unit heaters with 1.5 m clearance.
- .7 Locate raceways not less than 125 mm clear where parallel to steam or hot water lines with a minimum of 75 mm at crossovers.
- .8 Do not install horizontal runs in masonry walls.
- .9 Use metallic raceway where temperatures exceed 75°C (167°F) or where enclosed in thermal insulation.
- .10 EMT and non-metallic conduits to contain insulated green ground wire.
- .11 Install 6 mm diameter nylon pull cord in empty raceways.

### 3.7 **CONDUIT AND FITTINGS**

- .1 Minimum conduit sizes:

- |    |                      |                       |
|----|----------------------|-----------------------|
| .1 | Surface installation | 21 trade size conduit |
| .2 | Embedded in concrete | 27 trade size conduit |
| .3 | Directly buried      | 53 trade size conduit |

- .2 Conduit application and type:

- |    | Application   | Type                                   |
|----|---|--|
| .1 | Corrosive areas   | rigid steel corrosion resistant coated |
| .2 | Hazardous areas   | rigid steel                            |
| .3 | Outdoor areas   | rigid steel                            |
| .4 | Embedded in concrete,<br>other than grade slab                                      | rigid steel (PVC)                      |
| .5 | In or below grade slab  | PVC                                    |
| .6 | Exposed in unfinished areas up to<br>3 m above finished floor. Use<br>EMT above 3 m | rigid steel                            |

- .7 Connection to motors and equipment subject to vibration liquid tight flexible steel conduit
- .8 Final connection to dry type transformer flexible steel conduit
- .9 Whip connection to modular furniture non-metallic extra flexible PVC
- .3 Use field threads on rigid conduit of sufficient length to draw conduits up tight.
- .4 Do not bend coated steel conduit. Use elbows for deflections.
- .5 Do not install conduit in or under slab.
- .6 Use factory "ells" where ninety degree bends are required for 27 trade size and larger conduits.
- .7 Bend conduit offsets cold. Do not install crushed or deformed conduits and avoid trapped runs in damp or wet locations. Prevent the entrance of water and lodging of concrete, plaster, dirt, or trash in conduit, boxes, fittings, and equipment during course of construction.
- .8 Where conduit joints occur in damp or wet locations, make joints watertight by applying an approved compound on the entire thread area before assembling. Draw up all conduit joints as tightly as possible.
- .9 Cap exposed empty conduits which do not terminate in outlets, panels, cabinets, etc., with standard galvanized plumber's pipe caps.
- .10 Plug empty conduits which terminate flush with floors or walls with flush coupling and brass plug.
- .11 Install conduit sleeves for all exposed conduits and cables passing through walls, ceilings, or floors, and fill void between sleeve and conduit with caulking. If fire-rated caulking is required by code, use same class as walls, ceilings or floors.
- .12 Terminate conduit stubbed up through concrete floor for connection to free standing equipment with a coupling flush with finish floor, and extend rigid conduit to equipment, except where required, use flexible conduit from a point 150 mm above floor.
- .13 Install double locknuts and bushings on all rigid conduit terminations into threadless openings. Increase length of conduit threads at terminations sufficiently to permit bushing to be fully seated against end of conduit.
- .14 Mechanically bend steel conduit.
- .15 Install sealing condulets in conduits at hazardous area boundaries.
- .16 Conduits in Poured Concrete
  - .1 Locate to suit reinforcing steel. Secure firmly to prevent movement during pour.
  - .2 Clear each conduit with mandrel and brush before concrete sets.
  - .3 Protect conduits from damage where they stub out of concrete.
  - .4 Install sleeves where conduits pass through slab or wall.
  - .5 Provide oversized sleeve before membrane is installed where conduits pass through waterproof membrane. Use cold mastic between sleeve and conduit.

- .6 Encase conduits completely in concrete; provide 50 mm minimum concrete cover.
- .7 Replace with exposed conduit, any conduit run found to be obstructed after concrete sets.

### 3.8 **EMT AND FITTINGS**

- .1 Minimum EMT size: 21 trade size conduit.
- .2 EMT Application
  - .1 Exposed in unfinished areas, above truss level and for drops in column web to 3 m above finished floor. Use rigid steel conduit below 3 m.
  - .2 In block walls and stud partitions.

### 3.9 **CABLE TRAY**

- .1 Install cable tray systems.
- .2 Provide barriers where required by code.
- .3 Support cable trays from structural members. Support cable tray on both sides or on cantilever brackets to provide continuous open access to one side of the tray as required. Coordinate support locations and weight per support with building structure. Provide any additional support fastenings required.
- .4 Provide the following minimum clearances:
  - .1 300 mm vertical between top of tray and equipment or structure above.
  - .2 300 mm vertical between trays.
  - .3 600 mm horizontal on access side of tray.
- .5 Ensure that sharp burrs or projections are removed to prevent damage to cables and injury to personnel.
- .6 Install cables individually.
- .7 Lay cables into cable tray. Use rollers where necessary, to pull cables.
- .8 For maintained spacing, secure cables in cable tray at 3 m centers for horizontal runs with black coloured tie wraps and at 1.5 m centres for vertical runs with aluminum clamps supplied by tray manufacturer.
- .9 Maintain power cables greater than one diameter minimum spacing unless shown otherwise.
- .10 Firestop Fire Barriers (Refer to Section 26 05 01).
  - .1 Frame openings in walls, and floors for width and depth required for cable tray to run through with 50 mm clear all around.

### 3.10 **WIREWAYS**

- .1 Install per manufacturer's recommendations.
- .2 Keep number of elbows, offsets and connections to a minimum.

.3 Install barriers where required by code.

.4 Install gutters to full length of equipment.

### 3.11 **SURFACE RACEWAYS**

.1 Install per manufacturer's recommendations.

### 3.12 **CELLULAR FLOOR SYSTEM**

.1 Install trench duct, preset inserts and activation kits including activation power and data receptacles and telephone jack outlets.

.2 Tack weld trench duct to non-cellular decking, and tack weld trench duct void closures.

.3 Seal voids at preset inserts, cellular raceway butt joints and void closures with sealing compound.

### 3.13 **FASTENINGS AND SUPPORTS**

.1 Provide supports and fastenings for the Work of this division. Do not use supports or equipment provided by other trades.

.2 Equipment fastenings and supports shall conform to manufacturers recommendations.

.3 Do not attach to, or suspend any electrical Product or service from the roof deck, mechanical ductwork or piping.

.4 Do not use wire lashing or perforated strap to support or secure raceways or cable.

.5 Support rods for any suspended item must not be attached to or extended through steel pan type roofs or through concrete slab roofs.

.6 For surface mounting of two or more raceways or cables use channels.

.7 Where there is no wall support for raceways and cables dropped vertically to equipment, provide channel properly secured to floor and structure.

.8 Hang supports from structural members. Where location does not permit direct support from structure provide necessary brackets, frames, channels secured to structural members.

.9 Fasten exposed conduit and cables to building construction or support systems using straps. Use beam clamps on exposed steelwork.

.10 Masonry, tile and plaster surfaces: Use lead anchors.

.11 Poured concrete: Use expandable inserts. Low velocity powder activated fastenings may be used only in poured concrete.

.12 Steel structures: Use clips, spring loaded bolts, cable clamps, designed as accessories to basic channel members.

.13 Do not use powder activated fasteners in, tile, precast concrete or steel structure.

.14 Do not install conduits or cables on the bottom chord of joists or trusses.

.15 Use beam clamps of the two-bolt design and of such type that the rod load is transmitted only concentrically to the beam web centreline. The use of "C" and "I" beam side clamps will not be allowed.

- .16 Where the roof or floor framing consists of open web or long span steel joists and/or trusses, ensure that hangers are located at or within 150 mm of the joist or truss top or bottom chord panel points, otherwise provide additional structural steel as required where hanger spacing does not coincide with joist or truss spacing. Design suspension assembly such that the hanger load is transmitted only concentrically to the supporting joist or truss. The use of "C" and "I" beam clamps, brackets, etc., will not be allowed.
  - .17 Locate secondary structural steel members between joists or trusses at or within 150 mm of top or bottom chord panel points. Where the secondary structural steel member cannot be located at or near a joist or truss panel point, provide additional diagonal structural steel web member/members designed for the applicable load to the nearest panel point in the opposite chord member. Diagonal hangers which will induce lateral stresses in the chord members of the joist will not be permitted. Submit Shop Drawings of the suspension assembly indicating the location of suspension or support points, the maximum load at each suspension point, location and size of hangers, brackets and intermediate framing members when required, and also details of connection to building structure.
- 3.14 **SPLITTER BOXES**
- .1 Install splitters as indicated and mount plumb, true and square to the building lines.
  - .2 Extend splitters full length of equipment arrangement.
- 3.15 **JUNCTION BOXES**
- .1 Install junction boxes in inconspicuous but accessible locations. Secure to structure.
  - .2 Install terminal blocks on mounting rails, for termination of each wire and cable regardless of size.
  - .3 Only one voltage source is permitted in a junction box.
  - .4 Install barriers to separate different auxiliary systems.
- 3.16 **TERMINAL BLOCKS - SURGE SUPPRESSION**
- .1 Install surge suppression terminal blocks.
- 3.17 **PULL BOXES**
- .1 Install pull boxes in inconspicuous but accessible locations. Secure to structure.
  - .2 Install pull boxes so as not to exceed 30 m of conduit run between pull boxes.
  - .3 Only one voltage source is permitted in a pull box.
  - .4 Install barriers to separate different auxiliary systems.
- 3.18 **OUTLET AND CONDUIT BOXES**
- .1 Install conduit outlet boxes for conduit up to 32 mm and pull boxes for larger conduits.
  - .2 Support boxes independently of connecting conduits.
  - .3 Seal boxes during construction to prevent entry of debris, dust and dirt.
  - .4 For flush installations mount plaster rings to box, flush with wall surface to permit wall finish to come within 6 mm of opening.

- .5 Provide correct size of openings in boxes for conduit, armoured cable connections. Reducing washers will not be acceptable.
- .6 Install switches and other controls close to door lock or latch jambs and other openings, maintaining a minimum of 100 mm from trims of doors (except where installed in door frames of metal partitions) check door swings.
- .7 Install 100 mm square or octagonal outlet boxes for lighting fixture outlets.

### 3.19 **MASONRY BOXES**

- .1 In block walls use deep boxes to provide clear space around knockout for AC90 cable entry.

### 3.20 **WIRING DEVICES - SWITCHES**

- .1 Install single throw switches with handle in up position when switch is closed.
- .2 Install switches in gang type outlet box when more than one switch is required in a location.
- .3 Mount toggle switches at height indicated.
- .4 Install switch colours as follows:

	Area	Colour
.1	Gypsum board, plaster or panelled	(white) (ivory) (brown)
.2	Office	(white) (ivory) (brown)
.3	Factory, service	brown (ivory)

### 3.21 **WIRING DEVICES - DIMMER SWITCHES**

- .1 Install each dimmer switch in outlet box at locations indicated.
- .2 Mount dimmer switches at height indicated.

### 3.22 **WIRING DEVICES - RECEPTACLES**

- .1 Install receptacles vertically, use gang type outlet box where more than one receptacle is required in a location.
- .2 Where split receptacle has a portion switched, mount vertically and switch upper portion.
- .3 Coordinate with architectural and interior design drawings for final positioning and mounting heights of power and voice/data receptacles. Where there is disagreement between electrical and architectural drawings, take the architectural drawings as correct.
- .4 Maintain clearances between receptacle outlet boxes and millwork as stipulated on the drawings.
- .5 Align and evenly space outlet boxes that are mounted as a group.
- .6 Install receptacle colours as follows:

	Area	Colour
.1	Gypsum board, plaster or panelled	(white) (ivory) (brown)
.2	Office	(white) (ivory) (brown)

- .3 Factory, service, exterior brown

**3.23 WIRING DEVICES - COVER PLATES**

- .1 Protect stainless steel cover plate finish with paper or plastic film until painting and other work is finished.
- .2 Install suitable common cover plates where wiring devices are grouped.
- .3 Do not use cover plates designed for flush outlet boxes on surface-mounted boxes.
- .4 Provide plaster ring where necessary.
- .5 Install cover plates as follows:

Area	Cover Plate Type
.1 Gypsum board, plaster or panelled	stainless steel (nylon) (white) (ivory)
.2 Factory, service	galvanized steel
.3 Exterior	cast cover

**3.24 WELDING RECEPTACLES**

- .1 Install welding receptacles.
- .2 Ensure that phase rotation is similar for all receptacles.

**3.25 CONTROL DEVICES**

- .1 Install as indicated.

**3.26 SNOW MELTING SYSTEM (SELF-REGULATING CABLE OR MI CABLE)**

- .1 Install cables.
- .2 Where not embedded in concrete, waterproof in-line splices may be used for connections to cold leads. Use heat shrink sleeves or other appropriate method to waterproof splices. Where cables are embedded in concrete, extend heating cables from slab to junction box. Splice to cold leads in junction boxes.
- .3 Secure cables in place with cable straps supplied by cable manufacturer. Maintain indicated spacing.
- .4 Install thermostat sensor, clear of cable, to sense slab temperature.
- .5 Install snow sensor in exposed location on roof well clear of any projection which could obstruct deposit of snow in collector. Mount sensor 600 mm above roof deck.

**3.27 ICE MELTING CABLE SYSTEM**

- .1 Install junction boxes, in suitable protected location, adjacent to start of each ice melting cable installation. Install ice melting cables along complete length of roof drains and downspouts. Install cable end seals at cable terminations at bottom of downspouts. Install downspout hangers where cable enters downspouts and roof drains.
- .2 Install thermostat in electrical room. Extend capillary through exterior wall, provide clamp on outside wall surface to hold coiled capillary with probe clear of wall. Seal wall penetration.

**3.28 HEAT TRACING CABLES**

- .1 Install heat tracing cables where indicated. Measure pipes at site for exact length and verify sizes.
- .2 Secure cable and remote sensor to pipe in accordance with cable manufacturer's recommendation keeping bulb clear of heating cable.
- .3 Install heating cable as per manufacturer's recommendations.
- .4 Wire to thermostat and heater cable in conduit. Provide watertight coupling at heater cable.
- .5 Coordinate with mechanical and sprinkler pipe trades. For exterior applied cable do not energize until insulation has been applied over cable.
- .6 Where installed inside pipes provide watertight gland for installation by pipe fitters.
- .7 Megger test insulation resistance before installation, before addition of thermal insulation and after addition of thermal insulation in accordance with manufacturer's recommendations.
- .8 Install and commission heat tracing system under supervision of manufacturer's representative.

3.29 **PLYWOOD BACKBOARDS**

- .1 Install plywood backboards.

3.30 **FIELD FABRICATED METAL WORK**

- .1 Clean and prime paint field fabricated metal work.
- .2 After fabrication deburr, scrape, grind smooth, wire brush with power brush and degrease metal work.
- .3 Prime paint steel with one coat of CISC/CPMA 2.75 oil alkyd primer.
- .4 Prime paint aluminum as follows: Wash with detergent solution and wipe down with SSPC-SP1 solvent. Apply Glidden #Y-5229 primer to 1.5 mils DFT.
- .5 For brass and bronze alloy materials, prepare as for aluminum but apply one coat of CAN/CGSB-1.40-M zinc chromate primer.

End of Section

- 1 General
  - 1.1 **SUMMARY**
    - .1 Section Includes
      - .1 Labour, Products, equipment and services necessary to complete the Work of this section.
  - 1.2 **GENERAL**
    - .1 Modifications, demolition and installation of services within this building require utmost care due to vital operation of systems involved. Removal and installation of systems require constant communication with Consultant.
  - 1.3 **CO-ORDINATION BETWEEN NEW AND EXISTING INSTALLATIONS**
    - .1 Provide interfacing components between new and existing systems as necessary for proper performance and operation.
  - 1.4 **EXISTING SERVICES**
    - .1 Ensure existing services remain undisturbed and energized except where indicated to be disconnected.
    - .2 Disconnect and remove abandoned wiring materials and devices.
    - .3 Cut raceways flush where embedded in structure.
    - .4 Retain abandoned embedded outlet boxes and close with pressed steel cover plates.
    - .5 Make safe all circuit wiring left for future use.
  - 1.5 **INTERRUPTION OF SERVICES**
    - .1 Obtain Consultant's written approval before interrupting any service. Long outages are not acceptable.
    - .2 Provide temporary services to maintain continuity in the event that services must be interrupted.
  - 1.6 **PREMIUM TIME**
    - .1 Include cost of premium time in Tender Price for work during nights, weekends or other time outside normal working hours necessary to do the Work and maintain electrical services in operation.
- 2 Products
  - 2.1 **USE OF EXISTING MATERIAL AND EQUIPMENT**
    - .1 Unless noted otherwise, existing panels, boxes and wiring materials may be reused if acceptable to inspection authority.
    - .2 Unless noted otherwise, provide additional equipment of same type and manufacture to supplement existing equipment.
    - .3 Reused luminaires: Furnish new lamps.
- 3 Execution

**3.1 EXISTING MATERIAL AND EQUIPMENT**

- .1 Equipment to be reused or relocated: Test for proper operation, and repair as necessary.
- .2 Repair or replace existing equipment which is damaged in process of relocation.
- .3 Reused luminaires: Install lamps, clean fixtures and touch up damaged finish.
- .4 Relocate existing junction, pull or terminal boxes which become inaccessible due to new mechanical ductwork or equipment.

**3.2 DEMOLITION**

- .1 Demolish existing work, where indicated, and remove from site.
- .2 Execute all demolition work so as to create minimum vibration or dust within and outside the building. Obtain Consultant's approval of methods before proceeding.

**3.3 WORK IN EXISTING TENANT FACILITIES**

- .1 Coordinate Work in tenant facilities with tenant. Ensure that no interruptions and/or interferences occur with tenant's normal operation.
- .2 Be responsible for any damage created in existing tenant facilities when installing equipment and materials.

**3.4 PENETRATIONS IN EXISTING STRUCTURE**

- .1 Perform cutting, patching and repairing. Before proceeding obtain Consultant's approval.
- .2 Where necessary to penetrate existing floors, walls, ceiling, roof or structural members provide sleeve and follow Consultant's instructions.
- .3 Restore surfaces to same finish and condition as existed prior to penetration.
- .4 Core Drilling Procedure
  - .1 Examine locations to be core drilled where:
    - .1 Diameter is greater than 25 mm
    - .2 Multiple drillings required and where the distance between centres is less than ten times the diameter of the hole
  - .2 Examine by most suitable method including:
    - .1 X-ray
    - .2 Ferro scan
    - .3 Cable detection
  - .3 Examine from both sides of the structure to be drilled.
  - .4 Examine proposed core drilling locations to determine:
    - .1 Possible interference with
      - .1 Services
      - .2 Structural components

- .2 Possible presence of asbestos tile or other asbestos based material. Report any occurrence or suspected occurrence to the Consultant immediately.
- .5 Select locations as suitable for core drilling and label them:
  - .1 Uniquely number each drilling location and core so that markings will be legible after drilling
  - .2 Mark each core with a north pointing arrow where drilling a slab or upward pointing arrow where drilling a wall
- .6 Without interfering with or damaging any services or structural elements, drill pilot holes sufficient to verify location of potential obstructions or for alignment purposes.
- .7 Use impact drill when drilling holes of 25 mm diameter or less. For holes of greater diameter use core drill.
- .8 Prepare report showing intended core drill locations including printouts, X-ray images. Submit the report for approval, to Consultant, prior to drilling.
- .9 Proceed with core drilling only after approval has been received from Consultant.
- .10 Confine drilling operation to time-of-day as stipulated by Consultant.
- .11 Position suitable warning notices of a type acceptable to Consultant and exercise caution to ensure safety and protection of personnel and property during drilling especially from effects of water, dust damage, or falling objects below the slab or behind the wall being drilled.
- .12 Stop drilling immediately, and report to Consultant, if contact is made with foreign objects such as reinforcing steel (rebar), electrical conduit, water pipes, drainage pipes.
- .13 Cover open holes with secured covers to guard against fall through of objects.
- .14 Provide necessary firestopping, temporary or otherwise, sufficient to firestop holes that would be otherwise open during hours that the location is unattended. Coordinate placement of firestopping with Consultant.
- .15 Store all cores or core fragments on site and make them available for inspection by Consultant. Dispose of the cores or core fragments after permission is received from Consultant.

### 3.5 **SALVAGE MATERIALS**

- .1 Remove from site materials in renovated areas that are not to remain or be reused, unless noted as remaining property of Owner.

End Of Section

(THIS PAGE INTENTIONALLY LEFT BLANK)

- 1 General
  - 1.1 **SUMMARY**
    - .1 Section Includes
      - .1 Labour, Products, equipment and services necessary to complete the Work of this section.
  - 1.2 **APPROVALS**
    - .1 Identification subject to prior approval of Consultant.
- 2 Products
  - 2.1 **WIRE AND CABLE MARKERS**
    - .1 Wire and Cable Diameter Less Than 13 mm
      - .1 Acceptable manufacturer
        - .1 Wieland Z type
    - .2 Cable Diameter 13 mm and Larger
      - .1 Acceptable manufacturer
        - .1 Wieland K type
    - .3 Non-Circular Wire
      - .1 Acceptable manufacturer
        - .1 Raychem Shrinkmark sleeves
  - 2.2 **CONDUIT AND ELECTRICAL METALLIC TUBING MARKERS**
    - .1 Stick-On Marker

	Raceway Size	Minimum Character Height
.1	¾" - 1¼"	15 mm
.2	1½" - 2"	19 mm
.3	Over 2"	32 mm
    - .2 Acceptable Manufacturers
      - .1 Brady, vinyl cloth, black on orange, type B-500
      - .2 Panduit, vinyl cloth, black on yellow, type PCL
      - .3 Wieland, mylar, black on yellow, type NL
  - 2.3 **CABLE TRAY MARKERS**
    - .1 Stick-On Marker
      - .1 Acceptable Manufacturers

- .1 Brady, vinyl cloth, black on orange, 48 mm character height, type B-500
- .2 Safety Supply Canada, conduit and voltage markers, style A, 48 mm character height
- .3 Panduit, vinyl indoor/outdoor, black on yellow, 50 mm character height, type PVL
- .4 Wieland, black on yellow, 50 mm character height, Electrocode NL

## 2.4 **BUSWAY MARKERS**

- .1 Stick-On Marker
  - .1 Acceptable Manufacturers
    - .1 Brady, vinyl cloth, black on orange, 48 mm character height, type B-500
    - .2 Safety Supply Canada, conduit and voltage markers, style A, 48 mm character height
    - .3 Panduit, vinyl indoor/outdoor, black on yellow, 50 mm character height, type PVL
    - .4 Wieland, black on yellow, 50 mm character height, Electrocode NL
  - .2 Laminated plastic, black letters on white background, 75 mm character height.
  - .3 Suspended sign, rigid vinyl, black on yellow, 75 mm character height.
    - .1 Acceptable Manufacturers
      - .1 Panduit
      - .2 Safety Supply Canada
  - .4 Typical identification: "12-1-1, 600A, 3P, 4W".

## 2.5 **PANELBOARD IDENTIFICATION**

- .1 Engraved laminated plastic, black lettering on white background, 6 mm character height.
- .2 Typical two-line identification for lighting panel:
  - "Lighting Panel C, 120/208V, 3 ph, 4W"
  - "Supplied from panel BB"
- .3 Directories: Typewritten identification of breaker number, ampere rating and connected equipment.

## 2.6 **SWITCHBOARD IDENTIFICATION**

- .1 Engraved laminated plastic, black lettering on white background, 15 mm minimum character height.
- .2 Typical identification: "Switchboard AAA, 347/600V, 3 ph, 4 w"; for branch feeders "Power Panel B.

## 2.7 **MOTOR STARTER, CONTACTOR AND DISCONNECT SWITCH IDENTIFICATION**

- .1 Engraved laminated plastic, black lettering on white background, 6 mm character height.

- .2 Typical identification: "Pump S4, 208V, 3 ph".

## 2.8 **MAGLOCK/FIRE ALARM PULL STATIONS IDENTIFICATION**

- .1 Engraved laminated plastic, red lettering on white background, 25 mm character height.
- .2 Identification: "EMERGENCY EXIT UNLOCKED BY FIRE ALARM OR BY SECURITY SYSTEM".

## 2.9 **WARNING SIGNS**

- .1 Outdoor: Metal, porcelain enamel finish. Indoor: Rigid vinyl.
- .2 Typical identification: "Danger - High Voltage".
- .3 Acceptable Manufacturers
- .1 Outdoor: Safety Supply Canada
- .2 Indoor: Safety Supply Canada, Panduit

## 2.10 **MARKER TAPE, SERVICE AND PHASE IDENTIFICATION**

- .1 Acceptable Manufacturer
- .1 3M, Scotch Code Tape, type STD with SDR colour refills or 3M Scotch 35 colour tape.

## 3 Execution

### 3.1 **SYSTEMS IDENTIFICATION**

- .1 Identify outlet boxes for various systems with distinctive paint colour. Apply a small area of paint to inside of outlet, junction and pull boxes and panels. In suspended ceiling areas, apply paint to inside and outside of junction boxes. System colours:

System	Normal	Emergency	UPS
120/208 volt	black	black/red	black/blue
347/600 volt	orange	orange/red	orange/blue
Fire alarm	red		
Intercom	brown		
Low voltage control	black		
PA and sound	light green		

### 3.2 **POWER COMPANY SERVICE IDENTIFICATION**

- .1 Identify service conductors with coloured marker tape as follows:
- .1 Phase A - red
- .2 Phase B - black
- .3 Phase C - blue
- .4 Neutral - white
- .5 Ground - green

### 3.3 **WIRE AND CABLE IDENTIFICATION**

- .1 Identify power, control, lighting and receptacle wires with continuous colouring as follows:
  - .1 Phase A - red
  - .2 Phase B - black
  - .3 Phase C - blue
  - .4 Neutral - white
  - .5 Ground - green
  - .6 Isolating ground - green and yellow
  - .7 Control - red
  - .8 Interlock - yellow
  - .9 D.C. - blue
- .2 For larger wire sizes available only in black, install coloured wire marker tape in accordance with above coding.

### 3.4 **WIRE AND CABLE IDENTIFICATION**

- .1 Cables Bearing Identification Numbers on the Drawings
  - .1 Install identification markers at each end of cable run.
- .2 Control/Indication Conductors
  - .1 Install conductor identification markers at switchgear, motor control centres and motor starter terminal blocks and at remote devices.
  - .2 Identification in accordance with the Drawings and reviewed Shop Drawings.
- .3 Lighting and Receptacle Branch Circuits
  - .1 Install conductor identification markers at panel, outlet box connections to lighting fixtures and device outlet boxes.
  - .2 Typical identification if fixture or device is connected to panel A, circuit 5: A-5.
- .4 Low Voltage Lighting Control
  - .1 Install conductor identification marker at relay phase conductors. Typical identification if connected to panel A, circuit 5: A-5.
  - .2 Install conductor identification marker on conductors between control locations and relay panels. Identify in accordance with reviewed Shop Drawings.
- .5 Data, Voice and Fibre Optic Cables
  - .1 Label horizontally distributed cabling at the following locations:
    - .1 Both ends of cable run
    - .2 Entrance and exit of cable pathway (i.e. cable trays, zone conduits, etc.)
  - .2 Label riser/backbone distribution cables at the following locations:

- .1 Both ends of cable run
- .2 Entrance and exit of cable pathway (i.e. cable trays, zone conduits, etc.)
- .3 1.5 m above finished floor in communication closets and equipment rooms
- .4 At entrance and exit of a sleeve or slot in communication closets and equipment rooms

.3 Use the following colour codes for labels:

Function	Colour
Auxiliary and miscellaneous circuits	Yellow
Common equipment	Purple
Customer side of network interface	Green
First level backbone	White
Horizontal cabling to workstations	Blue
Interbuilding backbone	Brown
Key telephone systems	Red
Network side of network interface	Orange
Second level backbone	Gray

Note: Common equipment refers to PBX equipment, host computer, LANs and multiplexer. Miscellaneous refers to maintenance alarms, security, paging systems, and other system and circuits not an integral part of common equipment. Colour codes to ANSI/TIA/EIA-606.

.6 Fire Alarm and Miscellaneous Systems

- .1 Install identification on conductors at panels, remote devices and system connections. Identify in accordance with reviewed Shop Drawings.
- .2 Install maglock/fire alarm pull station identification adjacent to each door equipped with a maglock.

3.5 **CONDUIT AND ELECTRICAL METALLIC TUBING (EMT) IDENTIFICATION**

- .1 Where Drawings indicate conduit and EMT identification numbers/letters, install identification markers at each end of run and at pull box locations.

3.6 **CABLE TRAY IDENTIFICATION**

- .1 Install markers indicating system, voltage, or voltages for trays with barriers, and identification number at intervals of 20 m maximum, at branches and termination locations.

3.7 **BUSWAY IDENTIFICATION**

- .1 Install stick-on markers indicating busway identification number and rating at cable tap boxes and thereafter at intervals of 30 m maximum.
- .2 Install suspended identification signs at start of run and at intervals of 30 m maximum.

3.8 **PANELBOARD IDENTIFICATION**

- .1 Install identification plates, using adhesive, on outside of panel.
- .2 Install directory.

.3 Identify main bus as follows:

- .1 Phase A - red
- .2 Phase B - black
- .3 Phase C - blue
- .4 Neutral - white
- .5 Ground - green

3.9 **SWITCHBOARD IDENTIFICATION**

.1 Install identification plates for panel and branch feeders.

3.10 **MOTOR STARTER, CONTACTOR AND DISCONNECT SWITCH IDENTIFICATION**

.1 Install identification plates using self-tapping screws.

3.11 **IDENTIFICATION AFTER FINISH PAINTING**

.1 Behind access doors at shaft plenums: identify busways, feeder cables and feeder conduits.

3.12 **EQUIPMENT WARNING SIGNS**

- .1 Install "Danger - High Voltage" signs.
- .2 When equipment is supplied from more than one source install red warning signs to this effect.

3.13 **PATCH PANEL AND FACEPLATE IDENTIFICATION**

- .1 Identify each jack at each wall or furniture outlet with a label supplied by the faceplate manufacturer. Each jack identification designation to match the respective cable identification designation.
- .2 Identify each jack at each patch panel jack with labels, front and back, supplied by the patch panel manufacturer. Each jack identification designation to match the respective cable identification designation.
- .3 In addition to an alphanumeric label use manufacturer's matching colour coded icons, which conform to ANSI/TIA/EIA-606, to identify individual jacks on faceplate and patch panels.

End of Section

- 1 General
- 1.1 **SUMMARY**
  - .1 Section Includes
    - .1 Labour, Products, equipment and services necessary to complete the Work of this section.
- 1.2 **REFERENCES**
  - .1 Canadian Standards Association: CSA
  - .2 C22.3 No. 1
  - .3 C22.2 No. 0.3-M
  - .4 C22.3 No. 2
  - .5 C22.2 No. 04-M
  - .6 C22.2. No. 41
  - .7 American Society for Testing and Materials: ASTM
  - .8 National Electric Testing Association Inc.: NETA
- 1.3 **SUBMITTALS**
  - .1 Submit certified test reports in accordance with Section 26 05 01.
- 2 Products
- 2.1 **MATERIALS**
  - .1 Furnish all materials, instrumentation, etc. required to execute testing and commissioning as specified, including manufacturers testing and commissioning.
  - .2 Calibrate test instruments and for each instrument record identifying numbers, date of calibration and percentage of error (if any) on appropriate test reports.
  - .3 Furnish megger test instruments as follows:

Megger Voltage	System Voltage
500 V	up to 250 V (low voltage)
1000 V	277 V to 1000 V (low voltage)
- 3 Execution
- 3.1 **CO-ORDINATION OF ELECTRICAL PROTECTIVE DEVICES**
  - .1 Following receipt of Shop Drawings, obtain from manufacturers time-current curves of all protective devices.
  - .2 Coordinate setting of relays, rating of fuses and trip elements of circuit breakers, so that the protective device immediately ahead of any fault operates before any upstream protection and establish selective coordination throughout the system.
  - .3 Prepare a complete set of curves showing time current characteristics for all breakers and fuses from main switchboard main circuit down to 208/120 V panels.

### 3.2 PRE-TEST INSPECTION AND CLEANING

- .1 Check that all dust, debris, surplus materials and tools, have been removed from equipment.
- .2 Inspect all parts of the power distribution systems at each voltage level for completeness, check and set circuit protective devices, fuses, breaker relays, trips, and all ancillary devices in accordance with the reviewed coordination studies, approved drawings and manufacturer's instructions.
- .3 Check phase sequence throughout the systems and application of colour codes to equipment and cables.
- .4 Verify all cable sizes, equipment ratings, trip settings conform to Specifications and coordination study.

### 3.3 TESTING GENERAL

- .1 Test the electrical installation including all safety devices as the Work progresses and on completion.
- .2 Without adjustment to the Contract Price:
  - .1 Repair, rework or replace any equipment, material or workmanship which fails specified tests.
  - .2 Perform such additional tests and re-tests as may be directed by the Consultant and/or Owner's Representative.
- .3 Energize each voltage level of the system immediately after testing is complete.
- .4 In case this is not feasible verify all fuse sizes and trip settings and repeat megger tests of each feeder and equipment with circuit breakers and switches open, immediately before energization.
- .5 Distribution Panels and Panelboards
  - .1 Check bolted connections bus to bus, and bus to cable lug with torque wrench, to manufacturer's values. Mark with adhesive tape or label when satisfactory.
  - .2 Measure contact resistance on low voltage fusible and non fusible switches, circuit breakers, contactors and auxiliary equipment. Acceptable values:

	Microhms
Low voltage - up to 250 V	500
Low voltage - 277V to 1000V	500
  - .3 Megger test insulation resistance phase to phase and phase to ground of fusible switches, circuit breakers, contactors, buswork, auxiliary equipment. Acceptable values:

	Megohms
Low voltage, up to 250V	1
Low voltage, 277V to 1000 V	50
Duration of each test: one (1) minute	
  - .4 Check ground bus and ground path for continuity, and connection to all non-current carrying metalwork. Maximum acceptable reading 0.1 ohms.

- .5 Check for physical faults: Damaged or dirty insulators, alignment of contacts, switchblades, operating mechanism, clearances, barriers, mounting.
- .6 Operate circuit breakers, switches, contactors, three times.
- .7 Operate equipment through design functions, including remote control operation, actuation of alarm and indication devices, mechanical and electrical operation and operation from protective relays.
- .8 Check 600V circuit breakers for trip and target operation. Test long time, short time, instantaneous and ground fault trips. Trip settings shall conform to values selected in the coordination study. Verify pickup and time values. Compare actual trip time with manufacturer's specifications and present in tabular form.
- .9 Balance loads on all panelboards. Use Shop Drawing information for all equipment loads.

3.4 **LOW VOLTAGE SWITCHBOARDS UP TO 1000 VOLT SERVICE**

- .1 Visually inspect components and complete assembly, check wiring and interconnections.

3.5 **LOW VOLTAGE STARTERS, CONTACTORS UP TO 1000 VOLT SERVICE**

- .1 Visually inspect components and the complete assembly.
- .2 Check each contactor and starter for switch or breaker operation, fuse or breaker rating, contactor size and operation, auxiliary contact operation.
- .3 Check starter overloads with motor nameplate ratings.
- .4 Check controls and starters and contactors operation on load.
- .5 Check motor rotation.

3.6 **DISTRIBUTION TRANSFORMERS UP TO 1000 VOLT SERVICE**

- .1 Set taps for nominal voltage output from secondary with initial loads applied.
- .2 Check for clear airflow through enclosure.
- .3 Check that connections are not stressed.

End of Section

(THIS PAGE INTENTIONALLY LEFT BLANK)

1 General

1.1 **SUMMARY**

.1 Section Includes

.1 Labour, Products, equipment and services necessary to complete the Work of this section including, but not limited to, the following:

.1 Lighting equipment as per the luminaire schedule and as specified herein.

.2 Refer to architectural reflected ceiling plans for exact location of luminaires.

.3 Check latest ceiling finish schedule in areas where recessed luminaires are specified to ensure that luminaires have suitable ceiling trim for particular ceiling finish.

1.2 **SUBMITTALS**

.1 Submit Shop Drawings in accordance with Section 01 33 00.

.2 Submit certified copies of photometric test data, for each luminaire type, prepared by independent testing laboratory. Photometric data to include total input watts, candlepower summary, candlepower distribution, zonal lumen summary, luminaire efficiency, coefficient of utilization table, lamp type, ballast type and manufacturer, and lumen rating in accordance with IESNA testing procedures.

.3 Submit samples as directed by Consultant for the following luminaire types:

1.3 **REFERENCES**

.1 Refer to the latest issue of the following standards:

.1 CSA C22.2 No. 9-M - General Requirements for Luminaires

.2 CSA C22.2 No. 34-M - Electrode Receptacles, Fittings, and Connectors for Gas Tubes

.3 CSA C22.2 No. 43-M - Lampholders

.4 CSA C22.2 No. 66 - Specialty Transformers

.5 CSA C22.2 No. 74 - Equipment for Use with Electric Discharge Lamps

.6 CSA C22.2 No. 141-M - Unit Equipment for Emergency Lighting

.7 ANSI/IEEE C62.41 - IEEE Recommended Practice on Surge Voltages in Low-Voltage AC Power Circuits

.8 CSA C860 - Performance of Internally Lighted Exit Signs

1.4 **CODES AND STANDARDS**

.1 All wiring to be in accordance with the Ontario Electrical Safety Code.

.2 Provide only equipment bearing a label acceptable to the Electrical Safety Authority (ESA) to indicate that the equipment has been tested to applicable CSA standards.

2 Products

2.1 **LUMINAIRES**

.1 General

- .1 Furnish luminaires in accordance with CSA C22.2 No. 9.
- .2 Furnish medium screw base lampholders of nickel or brass in accordance with CSA C22.2 No. 43.
- .3 Furnish mogul screw base lampholders of porcelain and nickel in accordance with CSA C22.2 No. 43.
- .4 Furnish lamp bases for gas tube lamps in accordance with CSA C22.2 No. 34.
- .5 Luminaire finishes shall resist chipping, crazing, discolouration.
- .6 Luminaires to contain no asbestos.
- .7 Furnish luminaires with flanges and gaskets to eliminate light leaks.

.2 Incandescent Luminaires

- .1 Furnish luminaires with all mounting and installation hardware.
- .2 Furnish accessories (guards, shields, reflectors, etc.) of the same manufacture as the luminaire.

.3 Fluorescent Luminaires

- .1 Fabricate steel luminaires from minimum 22 gauge mild sheet steel with joints securely fastened.
- .2 Do not use pre-painted steel.
- .3 Remove sharp edges.
- .4 Phosphate dip, prime and paint luminaire body, hardware and accessories with two coats of baked enamel, or other finish where indicated, after fabrication.
- .5 Interior baked enamel finish to have a minimum 88% reflectance and a minimum thickness of 1.2 mils.
- .6 Where two-level switching is indicated, furnish two ballasts, separately switched, with one ballast connected to the outer lamps and the other ballast connected to the inner lamp(s).
- .7 Acrylic lens, 100% virgin acrylic, 0.125" nominal thickness, extruded aluminum hinged frame.

.4 HID Luminaires

- .1 Rated for operation over a -30°C to +40°C (-22°F to +104°F) ambient temperature range unless otherwise noted in luminaire schedule.

.5 Exit Light Luminaires

- .1 Aluminum housing, stencil face, knock-out chevrons, unless otherwise noted in luminaire schedule.
- .2 150 mm high red letters.
- .3 Universal ceiling, end-to-wall, surface back-to-wall mounting or recessed mounting if indicated.

- .4 Connection for emergency 12 V source where indicated.
- .5 LED type with diffusing lens.

## 2.2 **BALLASTS**

### .1 Fluorescent

- .1 To CSA C22.2 No. 74.
- .2 Electronic, to operate one or two lamps, integrally mounted in luminaire unless otherwise indicated.
- .3 Rapid start type for normal output lamps unless otherwise indicated.
- .4 Instant start type for high output lamps.
- .5 Totally enclosed containing no polychlorinated biphenyls.
- .6 Rated 60 Hz, voltage as indicated.
- .7 Rated for operation over an ambient temperature range of 10°C to 40°C (50°F to 104°F).
- .8 Maximum case temperature not greater than 25°C (77°F) above ambient temperature.
- .9 Operate at in a frequency range of 25 kHz to 40 kHz.
- .10 Produce no visible flicker.
- .11 Minimum sound rating of Class A.
- .12 Minimum ballast factor of 0.9 unless otherwise noted in luminaire schedule.
- .13 Minimum power factor of 0.95.
- .14 Maximum crest factor of 1.5.
- .15 Maximum input current total harmonic distortion of 15% measured at rated output.
- .16 To withstand line transients as defined by ANSI/IEEE C62.41, Category A.
- .17 Acceptable manufacturers (unless otherwise specified in luminaire schedule):
  - .1 Advance
  - .2 Osram Sylvania
  - .3 Universal

### .2 Metal Halide

- .1 To CSA C22.2 No. 66 and CSA C22.2 No. 74.
- .2 Integrally mounted in luminaire unless otherwise indicated.
- .3 Rated 60 Hz, voltage as indicated.

- .4 Two-winding constant wattage isolated winding (CWI) or three-winding magnetic regulator (Mag Reg) type ballast unless otherwise specified in luminaire schedule.
- .5 Lamp wattage regulation to be  $\pm 10\%$  maximum for a line voltage variation of  $\pm 10\%$  from rated voltage.
- .6 Totally enclosed containing no polychlorinated biphenyls.
- .7 Class 180 insulation.
- .8 Minimum ballast factor of 0.95.
- .9 Minimum power factor of 0.95.
- .10 Maximum crest factor of 1.65 for metal halide and 1.80 for mercury.
- .11 Maximum input current total harmonic distortion of 20% measured at rated output.
- .12 Ballast UL bench top rise temperature code to be suitable for the luminaire in which it is installed.
- .13 Minimum  $-30^{\circ}\text{C}$  ( $-22^{\circ}\text{F}$ ) starting temperature.
- .14 Acceptable manufacturers:
  - .1 General Electric
  - .2 Holophane
  - .3 Universal
  - .4 Advance
- .3 High Pressure Sodium
  - .1 To CSA C22.2 No. 66 and CSA C22.2 No. 74.
  - .2 Integrally mounted in luminaire unless otherwise indicated.
  - .3 Rated 60 Hz, voltage as indicated.
  - .4 Two-winding constant wattage isolated winding (CWI) or three-winding magnetic regulator (Mag Reg) type ballast unless otherwise specified in luminaire schedule.
  - .5 Lamp wattage regulation to be  $\pm 10\%$  maximum for a line voltage variation of  $\pm 10\%$  from rated voltage.
  - .6 Totally enclosed containing no polychlorinated biphenyls.
  - .7 Class 180 insulation.
  - .8 Minimum ballast factor of 0.95.
  - .9 Minimum power factor of 0.95.
  - .10 Maximum crest factor of 1.65.

- .11 Maximum input current total harmonic distortion of 20% measured at rated output.
- .12 Ballast UL bench top rise temperature code to be suitable for the luminaire in which it is installed.
- .13 Minimum -40°C (-40°F) starting temperature.
- .14 Igniter with an automatic shutdown circuit to de-energize the high voltage pulses when an inoperative or missing lamp is detected.
- .15 Acceptable manufacturers:
  - .1 General Electric
  - .2 Holophane
  - .3 Universal
  - .4 Advance

## 2.3 LAMPS

100	ED23.5	Mogul universal	diffuse-2000K	24,000	8800	22

.8 Acceptable lamp manufacturers unless otherwise specified in luminaire schedule:

- .1 General Electric
- .2 Osram Sylvania
- .3 Philips

2.4 **LIGHTING POLES**

- .1 Design poles and arms to withstand wind loading of 160 km/h and gusts of 1.3, without deformation, with designated luminaires installed.
- .2 Furnish poles (square) (round) (octagonal), (tapered) (straight), (steel) (aluminum), finish and colour as shown, designed for mounting on concrete base, height as indicated, complete with base bolt covers, grounding lug, handhole and flush weatherproof cover at base housing fuses and terminal strip.
- .3 Fuseholder, in-line, waterproof, breakaway type with 10 A fuse.
  - .1 Acceptable fuseholder manufacturers:
    - .1 Bussman, Tron fuseholder, HEB series with insulation boot
    - .2 Buchanan/Elastimold, Style 65
    - .3 Gould Shawmut, GEB series with insulating boots

## 2.5 **EMERGENCY BATTERY UNITS**

- .1 Supply voltage 120 (277) (347) V ac.
- .2 Output voltage 12 V dc.
- .3 Batteries: Sealed lead acid calcium alloy grid type sized to operate the lamp load to 91% of initial voltage for thirty minutes unless otherwise specified in luminaire schedule.
- .4 Battery charger: Solid state, multi-rate, voltage/current regulated, sized to restore battery to full charge in twelve hours.
- .5 Low voltage disconnect: Solid state, modular, operates at 80% battery voltage.
- .6 EEMAC 1 code gauge steel housing unless otherwise specified in luminaire schedule.
- .7 Auxiliary equipment:
  - .1 "AC power ON"
  - .2 "Fast charge" pilot light
  - .3 Voltmeter
  - .4 Test switch
  - .5 Five minute time delay relay
  - .6 Cord and plug (120 V only)
- .8 Lamp heads: Mounted as indicated, 360 degree horizontal and 180 degree vertical adjustment, type and wattage as specified in luminaire schedule.
- .9 Acceptable manufacturers: As specified in luminaire schedule.

## 3 Execution

### 3.1 **INSTALLATION - GENERAL**

- .1 Provide supports for luminaires. Support single units from luminaire studs in outlet boxes. For continuous row fluorescent type, provide support for each end plus at least one for each channel section, or additional as required. Swivel mount stems. Provide concrete

- inserts at points of luminaire support in unfinished areas where a concrete slab serves as ceiling. Provide support from concrete floor and roof steel above ceiling as applicable.
- .2 Align luminaires in rows, maintain required heights, and install luminaires clear of other work.
  - .3 Clean and relamp existing luminaires being removed and installed in new locations.
  - .4 Keep luminaires covered and protected from construction dust and debris until building is broom clean and free of suspended dust clouds.
  - .5 Do not lamp luminaires until ready for testing and use. Obtain Owner's approval before lamping. Install lamps in lampholders.
  - .6 When installation is complete, demonstrate operation to satisfaction of Owner.
  - .7 Standard octagonal boxes may be supplied where conduits feeding luminaires in finished areas are exposed on ceiling if hanger canopies entirely cover outlet boxes and are neatly notched for conduit. Otherwise, provide cast conduit outlet boxes with a diameter larger than canopies.
  - .8 Attach boxes or hickeyes directly to poured concrete with 6 mm minimum diameter bolts and lead expansion anchors where luminaires are suspended directly from concrete slabs. Use 8 mm minimum bolts through precast slabs, welded to 100 mm x 100 mm minimum, 3.5 mm plate above slabs.
  - .9 Do not mount luminaires above pipes, ducts or equipment. In event of unavoidable tight locations, provide hangers to clear obstructions. Check layouts of other trades on job and plan cooperatively. Luminaires in any room shall hang at one height. Obtain approval before any changes are made to layouts shown.
  - .10 Provide continuous 12 mm x 38 mm channel above ceiling, where luminaires are suspended or mounted on furred ceilings. Fasten luminaires to channel with two 6 mm minimum diameter studs with minimum 1220 mm on centre.
  - .11 Where two 1220 mm surface or suspended fluorescent luminaires occur in tandem, an 2440 mm body may be used. Where two single lamp luminaires occur in tandem, a common lamp ballast may be used.
  - .12 Verify catalogue number of luminaires with description prior to ordering, and check for final ceiling finish in areas where recessed luminaires are called for in order to provide ceiling trim, flanges and mounting brackets to suit particular construction used where luminaires are installed.
  - .13 Support luminaires in an approved manner to comply with the Ontario Electrical Safety Code and the Ontario Building Code.
  - .14 Provide steel luminaire studs, brackets and hangers. Where luminaires are hung on chain hangers, provide chain of closed link type capable of supporting ten times luminaire weight. Use U-bolts for chain ends; S-hooks are not acceptable.

### 3.2 **INSTALLATION - INDUSTRIAL**

- .1 For industrial luminaires suspended from ceiling outlet boxes, provide 13 mm rigid combination conduit stems, luminaire stud, and self-aligning hangers. In other locations, except as otherwise detailed or required, provide ceiling or wall outlet boxes with 9.5 mm, no-bolt luminaire studs. Provide special hangers for support of any luminaire which weighs more than 23 kg.
- .2 In high vibration areas, mount luminaires with cushion hangers.

- .3 Where specified, provide safety restraint device (safety chain or safety cord) of minimum length as recommended by the manufacturer.
- .4 The manufacturer to certify that the safety restraint device has been drop tested for the actual luminaire and restraint length.

### 3.3 **INSTALLATION - EMERGENCY AND EXIT LIGHTS**

- .1 Exit sign installation shall meet all requirements of the authorities having jurisdiction.
- .2 Install emergency battery units where shown. Support on brackets supplied by manufacturer.
- .3 Aim heads to properly illuminate exit path.

### 3.4 **INSTALLATION - CEILINGS**

- .1 Suspend luminaires mounted from or in a suspended T-bar ceiling directly from building structure, independent of the T-bar system, to ULC, Local Fire Marshal's Office, Ontario Building Code, Electrical Safety Authority (ESA) and Consultant's approval.
- .2 In non-accessible ceilings wire with not more than 1200 mm of AC90 or RW90 XLPE wire in flexible conduit to adjacent outlet boxes placed above finished ceiling within reach of the luminaire openings.
- .3 In accessible ceilings wire with not more than 1.8 m of AC90 or RW90 XLPE wire in flexible conduit to adjacent outlet boxes, locations as shown on the Drawings.
- .4 Provide suitable trim for all luminaires installed in drywall ceilings or within lay-in or snap-in tiles.

### 3.5 **INSTALLATION - POLES**

- .1 Wire down inside of lighting poles with No. 10 AWG RW90 plus No. 10 AWG insulated ground wire and secure to clips. Provide strain relief at the top of the pole so that the weight of the wiring down to the bottom of the pole does not place a strain on the wiring terminations. Install fuse holders and fuses.
- .2 Assemble arms and luminaires securely to pole. Provide lamps in lampholders.
- .3 Erect pole plumb and true on base. Along roadways, orient pole handhole on the side opposite the roadway unless otherwise indicated.
- .4 Connect underground ground wire and pole ground wire at ground lug in pole.
- .5 Leave slack in wires to allow connector and ground wire to be pulled out of handhole 150 mm clear of pole without disconnecting.

### 3.6 **FLOODLIGHTS**

- .1 Aim floodlights at night to satisfaction of Consultant.
- .2 Provide support from the building structure where floodlights are supported from buildings. Make support and wiring penetrations of the building envelope waterproof.

End of Section

265000_LUMINAIRE SCHEDULE				
TYPE	VOLTS	LAMP (QTY)	DESCRIPTION	MFR.TYPE/SERIES
L01	120	LED 3500K, MINIMUM 80 CRI	2' x 4' LED Recessed Ceiling Panel, 4000lm	Peer Lux PNLV Lithonia EPanel Metalux 22FP
L02	120	LED 3500K, MINIMUM 80 CRI	4' LED Wall mount strip light, 160w/lm, 4000lm	Metalux SNLED or equivalent
L03	120	LED 3500K, MINIMUM 80 CRI	1' x 4' LED Recessed Ceiling Panel, 3000lm	Peer Lux PNLV Lithonia EPanel Metalux 22FP
L04	120	LED 3500K, MINIMUM 80 CRI	4 inch LED Recessed Round Downlight, 2000lm, 40 deg	EcoNU4RD-SW-20-35K-80-HE40-120-NC-WH- WH or equivalent
L05	120	LED 3500K, MINIMUM 80 CRI	4' LED Surface Mount strip light, 4000lm, round,clear lens	Metalux SNLED or equivalent
L06	120	LED 3500K, MINIMUM 80 CRI	4' Surface Mount strip light, 2200lm, round, semi frost lens, narrow	Metalux SNLED or equivalent
L07	120	LED 3500K, MINIMUM 80 CRI	2' x 2' LED Recessed Ceiling Panel, 4000lm	Metalux SNLED or equivalent
L08	120	LED 2700K, MINIMUM 80 CRI	6" LED Recessed Downlight. Wet Location. 780lm. 120V.	Lithonia WF6 Downlight or equivalent

265000_LUMINAIRE SCHEDULE				
TYPE	VOLTS	LAMP (QTY)	DESCRIPTION	MFR.TYPE/SERIES
L09	120	LED 4000k, MINIMUM 75 CRI	Wet Location LED, Pendant mounted, Enclosed and gasketed fibreglass reinforced polyester housing with steel eclosed wireway, Corrosion resistant latches, High impact frosted acrylic diffuser, Medium distribution, IP66, 0-10V Dimmable Driver, Total 40 Watts, 4000 Lumens	Lithonia DMW2 4000L MD AFL 40K 80 CRI or equivalent
L10	120	LED 3500K, MINIMUM 80 CRI	Undercabinet striplight, length to suit cabinet geometry. Clip mounting to underside of cabinet. See Architectural typical kitchen millwork detail for mounting geometry. Provide 4 output driver mounted under cabinet near wall plug, "Optimized power setup"	Vode ZipOne 707 or equivalent
L11	120	LED 3000K	2' x 4', Wet location, vandal-reistant lensed troffer. 6400lm.	GRW Wet Location and GRV Vandal LED Troffer or equivalent
L12	120	LED 3000K	Aluminium shade pendant LED. Ivory, matte chrome finish. Hung from ceiling box. Box to include decorative junction box cover. Hung at 2500 AFF	Bruck Classic LLED-30K-90-900-MC-PMC or equivalent
L13	120	LED 400K	Aluminium exterior lighting bollard, up 65, ik08 rating, black 2x12w	Ligman UFRE-10011 Freetown 2 Bollard or equivalent
L14	120	LED3500K	3' 120v 3000k square vanity luminaire, 1300 lumen, wall mount, 26W	Lithonia Contemporary Square Vanity or equal
X01	120	LED	Exit Sign, Aluminum Housing, LED, Single Or Double Face, Back-to-Wall, End-to-Wall, pendant or Ceiling Mounted As Shown on Drawings, Green Running Man Pictogram, White Housing	Lumacell LA Series Beghelli Micra RM Series Aimlite RPALW Series
X02	120	LED	Exit Sign, Aluminum Housing, LED, Single Or Double Face, Back-to-Wall, End-to-Wall, pendant or Ceiling Mounted As Shown on Drawings, Green Running Man Pictogram, White Housing, C/W battery pack and remote heads	Lumacell LA Series Beghelli Micra RM Series Aimlite RPALW Series

265000_LUMINAIRE SCHEDULE				
TYPE	VOLTS	LAMP (QTY)	DESCRIPTION	MFR.TYPE/SERIES
B01	120	6W LED MR16	Emergency Battery Unit, 120 Volt Input, 12 Volt Output, Minimum 100 Watt Capacity For 30 minute for connected load, Enclosed In EEMAC 1 Code Gauge Steel Housing, 10 Year Life, Time Delay Relay, Voltmeter, Two Integral 6 Watt LED MR16 Heads	Lumacell Signature Series LD10 Heads, Lumacell RG12S Series or approved equal

1 General

1.1 **SUMMARY**

.1 Labour, Products, equipment and services necessary to complete the Work of this section including, but not limited to, the following:

.1 Control Devices

.1 Distributed dimming control systems

.2 Central dimming control system

.2 Input Devices

.1 Occupancy, vacancy sensors

.2 Sensor power packs

.3 Daylight sensors

.4 Multi Sensors

.5 Touchscreens

.6 Wallstations

.3 End Devices

.1 Relays

.2 Digital to Analog converters

.3 0-10V to Reverse phase converters

.4 LED drivers

.4 Software and Integration

.1 BMS integration

.2 LAN/VLAN integration

.3 Partition controls

.4 DMX integration

.5 ASCII integration

.6 Programming software

.7 Emergency lighting control (if applicable)

1.2 **REFERENCES**

- .8 National Fire Protection Association (NFPA)
  - .1 701 (2004) Standard Methods of Fire Tests for Flame Propagation

### 1.3 **COORDINATION REQUIREMENTS**

- .1 Coordination
  - .1 Coordinate the placement of lighting control panels
  - .2 Coordinate the placement of sensors, wallstations and other user input devices
  - .3 Coordinate the placement of daylight sensors to achieve optimal daylight dimming
- .2 Prewire meeting: Conducted on-site with lighting control system manufacturers or designated representative prior to commencing work as part of the manufacturer's standard practice and startup services. Manufacturer to review with the installer:
  - .1 Installation of lighting control panels and locations
  - .2 Lighting control network wiring
  - .3 Network IT requirements

- .4 Low voltage wiring requirements
- .5 Lighting control integration requirements
- .6 Lighting control system integration network wiring and connectivity
- .7 Installer responsibilities
- .8 Startup and training schedule and actions

#### 1.4 **SUBMITTALS**

- .1 Submit under provisions of Section 01 33 00.
- .2 Specification Conformance Document: Indicate whether the submitted equipment:
  - .1 Meets specification exactly as stated.
  - .2 Meets specification via an alternate means and indicate the specific methodology used.
- .3 Shop Drawings; include:
  - .1 Load schedule indicating actual connected load, load type, and voltage per circuit, circuits and their respective control zones, circuits that are on emergency, and capacity, phase, and corresponding circuit numbers.
  - .2 Schematic of system.
- .4 Product Data: Catalog specification sheets with performance specifications demonstrating compliance with specified requirements.
- .5 Project Record Documents: Installer to record actual installation location and settings of lighting control panels and components.

#### 1.5 **QUALITY ASSURANCE**

- .1 Manufacturer: Minimum 10 years' experience in manufacture of architectural lighting controls.
- .2 Manufacturer's Quality System: Registered to ISO 9001:2000 Quality Standard, including in-house engineering for product design activities.
- .3 Central dimming control system:
  - .1 Meets UL, cUL, and/or CSA Standards specifically for the required loads. Provide evidence of compliance upon request.

#### 1.6 **PROJECT CONDITIONS**

- .1 Do not install equipment until following conditions can be maintained in spaces to receive equipment:
  - .1 Ambient temperature: 0° to 40° C (32° to 104° F).
  - .2 Relative humidity: Maximum 90 percent, non-condensing.
  - .3 Lighting control system must be protected from dust and sprays during installation.

#### 1.7 **WARRANTY**

- .1 Provide manufacturer's warranty covering 5 year 100 percent parts to repair and replace defective equipment.
  - .1 Systems that do not provide 100 percent parts at no extra charge for the first 5 years of installation shall not be acceptable.
- .2 Provide manufacturer's additional warranty options to customer where required.
  - .1 Provide warranty options beyond initial 5 year period as an additional purchased service.

## 1.8 **COMMISSIONING**

- .1 Provide factory-certified field service engineer to a site visit to ensure proper system installation and operation under following parameters:
  - .1 Qualifications for factory-certified field service engineer:
    - .1 Certified by the equipment manufacturer on the system installed.
  - .2 Make a visit upon completion of installation of central dimming control system:
    - .1 Verify connection of power feeds and load circuits.
    - .2 Verify connection Wallstation controls.
    - .3 Verify proper connection iCAN link.
    - .4 Download system panel data to dimming panels.
    - .5 Check dimming panel load types and currents and remove by-pass jumpers.
    - .6 Verify system operation control by control, circuit by circuit.
    - .7 Obtain sign-off on system functions.
    - .8 User to be trained on system operation

## 1.9 **MAINTENANCE**

- .1 Make ordering spare parts available to end user.
- .2 Make new replacement parts available for minimum of ten years from date of manufacture.
- .3 Provide factory direct technical support hotline.
- .4 Provide on-site service support where required.
- .5 Offer renewable service contract on yearly basis, to include parts, factory labor, and annual training visits to customer if desired.

## 1.10 **DELIVERY, STORAGE AND FIELD CONDITIONS**

- .1 Ensure products are delivered as shipped, including pallet assembly and packaging has not been damaged in shipment.
- .2 Store products in a clean, dry location in manufacturers original packaging.
- .3 Store products in an environment that meets products ambient and storage temperature per products specification sheets.

- .4 Store products in an environment that meets products relative humidity of less than 90 percent, non-condensing as outlined on the product specification sheets.

#### 1.11 **SYSTEM DESCRIPTION AND OPERATION**

- .1 The Lighting Control and Automation system as defined under this section covers the following equipment:
  - .1 Distributed dimming control system – Simplified factory assembled dimming and switching solutions that meet typical applications and simplify low voltage wiring to help a space meet the latest IECC, ASHRAE and Title 24 energy codes.
  - .2 Centralized dimming control system – Factory assembled dimming and switching solutions that allow for applications to scale from small to enterprise while providing simplified low voltage wiring to allow for system completion faster. This system includes third party integration and features to simplify complex application designs.
  - .3 Occupancy Sensors – PIR, DT and ULT Auto adjusting, NEMA WD7 compliant occupancy or vacancy sensors.
  - .4 Wallstations – Smart device that are fully programmable, pre-engraved digital pushbutton wallstations and dimmers.
  - .5 Scene Wallstation – Smart device that are fully programmable, pre-engraved digital pushbutton scene wallstations, dimmers and programmable scene buttons.
  - .6 Daylight Photosensor – Smart device that is a multi-zone open loop daylight sensor with two-way active infrared (IR) communications, which can provide dimming control for daylight harvesting.
  - .7 Touchscreens – Full color touchscreen that can be programmed to control any area on the lighting control network. Shall include multiple screens with templates for simplified programming as well as password protected screen locking features.
  - .8 3rd Party Integration – Interface shall be provided to allows for 3rd party integration via serial or Ethernet into the iLumin Plus lighting system using standard ASCII commands
  - .9 BAS Integration – BACnet interface shall be available to allow BAS systems to detect and control area status.
  - .10 Demand Response – OpenADR or other demand response input shall be connected to one or more iLumin Plus panels. The DR signal will trigger a response to the lighting and is fully programmable based on a single area or the entire network.
  - .11 iLumin Plus communication network – iCANnet CANbus wiring using Belden 1502 or 1502P network wire to create the iLumin Plus system lighting control network.
  - .12 2 wire topology free polarity free low voltage network – 18AWG or 14AWG twisted pair wire (purple and purple) is preferred for connecting user interface devices to the iLumin Plus lighting control panels. This simplifies the design, installation and controls allowing the installer and designer to get off the job faster.

- .2 Minimum lighting control performance required, unless local energy code is more stringent.
  - .1 Occupancy/vacancy requirements - Provide occupancy/vacancy sensors as indicated on drawings and sequence of operation.
  - .2 Daylight Zones – Primary sidelit or toplit areas within an enclosed space shall be controlled separately and automatically by a multi-level photocontrol device.
  - .3 Provide smooth and continuous daylight dimming for areas marked on drawings. Daylighting control system may be designed to dim electric light to the lowest light level.
  - .4 Provide the ability to adjust the high end and low end trim of the dimmers to ensure the lighting automatically provides energy saving even when daylighting calls for full illumination.
  - .5 Provide the ability for the dimmers and the relays to function separately. Systems where the 0-10V dimmers and relays are tied together reduce design capabilities and shall not be acceptable.
  - .6 Provide the ability to provide occupancy status to a Building Automation System.
  - .7 Shall be capable of automatically responding to a Demand Response Signal and adjusting the lighting level. (Required for California Title 24 2013)

## 2 Products

### 2.1 **MANUFACTURERS**

- .1 Acceptable Manufacturers:
  - .1 Cooper Lighting Solutions
  - .2 Douglas Controls
- .2 Basis of design product: Cooper iLumin Plus system or subject to compliance and prior approval with specified requirements of this section, one of the following:
  - .1 Cooper iLumin Plus system
  - .2 Douglas Controls
- .3 Substitutions:
  - .1 No substitution will be accepted prior to award of Contract.
  - .2 All proposed substitutions (clearly delineated as such) must be submitted in writing for approval by the design professional
  - .3 Proposed substitutes must be accompanied by a review of the specification noting compliance on a line-by-line basis.
  - .4 Provide complete engineered shop drawings (including power wiring) with deviations for the original design highlighted in an alternate color to the engineer for review and approval prior to rough-in.

### 2.2 **GENERAL**

- .1 Provide system hardware that is designed, tested, manufactured, and warranted by a single manufacturer.

- .2 Architectural Lighting Controls: Ten-year operational life while operating continually at any temperature in an ambient temperature range of 0° C (32°F) to 40° C (104°F) and 90 percent non-condensing relative humidity.
- .3 Designed and tested to withstand electrostatic discharges up to 12,000 V without impairment per IEC 801-2.

## 2.3 **ILUMIN PLUS PANELS**

- .1 Mechanical:
  - .1 Meets UL, cUL, and/or CSA Standards specifically for the required loads. Provide evidence of compliance upon request.
  - .2 Delivered and installed as a factory assembled panel listed to UL508.
  - .3 Field wiring accessible from front of panel without need to remove dimmer or relay assemblies or other components.
  - .4 Panels passively cooled via free-convection, unaided by fans or other means.
- .2 Electrical:
  - .1 Electrolytic capacitors to operate under the component manufacturer's maximum temperature rating when device is under fully-loaded conditions in 40° C (104° F) ambient temperature.
  - .2 Design and test dimmers/relays to withstand line-side surges without impairment to performance.
    - .1 Panels: Withstand surges without impairment of performance when subjected to surges of 6,000 volts, 3,000 amps per ANSI/IEEE C62.41 and per IEC 61000-4-5 surge requirements.
    - .2 Other power handling devices: Withstand surges without impairment of performance when subjected to surges of 6,000 volts, 200 amps per ANSI/IEEE C62.41.
  - .3 Utilize air gap off, activated when user selects "off" at any control to disconnect the load from line supply.
  - .4 Power failure memory and dimmer/relay recovery:
  - .5 When power is interrupted and subsequently returned, lights will automatically return to same levels (dimmed setting, full on, or off) prior to power interruption.
  - .6 In 3 phase panels loss of power to any phase should not effect operation or control dimmers on any other phase.
- .3 Performance:
  - .1 Shall be UL listed to relevant standards (UL508A, UL916, cULus)
  - .2 Shall be capable of mixed voltages 120/277VAC 50/60Hz
  - .3 Shall be capable of mixed sources including normal and emergency power
  - .4 Shall include a panel SCCR rating of 25kA
  - .5 Shall be capable of providing a mixed module solution panel including relays, dimmers and DALI controls.

- .6 Shall be capable of meeting the latest IECC, ASHRAE and Title 24 energy codes
- .7 Shall support three enclosure sizes
  - .1 Small Enclosure
    - .1 Shall support up to two modules
  - .2 Medium Enclosure
    - .1 Shall support up to four modules and PC connection module
    - .2 Shall include configurations with Ethernet connection to building LAN or VLAN
  - .3 Large Enclosure
    - .1 Shall support up to eight modules and PC connection module
    - .2 Shall include configurations with Ethernet connection to building LAN or VLAN
  - .4 Relay Module: (SCMR1220)
    - .1 Up to 48 relays in large enclosure
    - .2 Each relay module shall support up to twelve 20A fully rated relays
      - .1 Shall include heavy duty 20A @40C relays
    - .3 Rated life of relay: Minimum 1,000,000 cycles.
    - .4 Load switched in manner so that there is no arcing at mechanical contacts when power is applied to and removed from load circuits.
    - .5 Fully rated output continuous duty for inductive, capacitive, and resistive loads.
    - .6 Relay controller shall include the capability for DMX input control with base address
    - .7 Relay controller shall include the capability for DALI input control
    - .8 Relay controller shall include alert dry contact input for hardware override of all relay.
  - .5 Dimmer Module: (SCMH1200)
    - .1 Up to 48 Low Voltage Dimming (0-10V) channels in large enclosure
    - .2 Each dimmer module shall support up to twelve 0-10V channels; Meet following requirements:
    - .3 Capable of controlling any 0-10V source.
    - .4 0-10V dimmers shall include a fail to full output safety feature by default

- .5 Provide isolated 0-10V output signal conforming to IEC 60929.
  - .1 50mA sink current per channel via IEC 60929.
  - .2 50mA source current per channel
- .6 0-10V controller shall include the capability for DALI input control
- .6 DALI: (SCMD4)
  - .1 Up to 16 DALI buses in medium enclosure
  - .2 Each DALI module shall support up to four DALI buses
  - .3 Shall include dedicated test/override buttons for each DALI bus
  - .4 Shall include a separate power supply for each DALI bus
    - .1 Shall provide 16V nominal, 250mA max current per bus
    - .2 Shall support 64 standard DALI devices per bus
  - .5 DALI controller shall include the capability for DMX input control with base address
  - .6 DALI controller shall include the capability for DALI input control
  - .7 DALI controller shall include alert dry contact input for hardware override of all relays
- .7 Ethernet: (EG2)
  - .1 Shall provide a single ethernet port for connection to the building LAN or VLAN
  - .2 Shall be capable of facilitating a LAN or Wi-Fi connection to the iLumin Plus system
  - .3 Shall include an integral web server
  - .4 Shall provide the capability for mobile devices to override the lighting system via scene or channel slider commands
  - .5 Shall provide the capability for 3rd party integration via ASCII control strings
  - .6 Shall provide the capability for bridging the iLumin Plus network across LAN or VLAN connections

## 2.4 INPUT DEVICES

### .1 WALLSTATIONS & TOUCHSCREENS

- .1 Product: DALI Wallstation
  - .1 Electronics:
    - .1 Use 18AWG – 14AWG wiring for low voltage communication to SCMD4 module
  - .2 Functionality:

- .1 Upon button press, LEDs to immediately illuminate.
    - .2 Each button shall be programmable to control any area, scene, channel
    - .3 Color: White
    - .4 Provide color matching faceplates with concealed mounting hardware where specified.
    - .5 Engrave wall stations with appropriate button, zone, and scene descriptions as specified.
  - .2 Product: Ineo Wallstation
    - .1 Electronics:
      - .1 Use iCANnet wiring for low voltage communication to ensure reliable data communication in high electrical noise environments.
    - .2 Functionality:
      - .1 Upon button press, LEDs to immediately illuminate.
      - .2 Each button shall be programmable to control any area, scene, channel
    - .3 Color: White
    - .4 Provide color matching faceplates with concealed mounting hardware where specified.
    - .5 Engrave wall stations with appropriate button, zone, and scene descriptions as specified.
  - .3 Product: [TSC-30]
    - .1 Communication: iCANnet protocol.
    - .2 Power: From the 9V external power supply (included)
    - .3 Connections: Five (5) wires Belden 1502 or 1502P
    - .4 Mounting: Wallbox (included)
    - .5 VGA 320x240 pixel resolution, 65,000 colors available
    - .6 3.5" diagonal backlit LCD touchscreen
    - .7 Shall allow up to 250 pages to be stored in memory
    - .8 Groups: The set of fixtures controlled by a given touchscreen shall be completely configurable through software and can span entire iLumin Plus network.
    - .9 Shall support individual zone level adjustment and save scene controls
- .2 ADDRESSABLE MULTI-SENSOR
  - .1 Product: [MST-6], [MTS-12],

- .1 Communication: DALI protocol.
  - .2 Power: From the DALI bus.
  - .3 Maximum Current Draw: 3.75 mA.
  - .4 Connections: Two (2) wires (16/18AWG, FT6, non-twisted, non-shielded, non-polarized and plenum rated) connected to the DALI communication bus.
  - .5 Sensing Technologies: Occupancy, daylight and temperature.
  - .6 Daylight Sensing Range: 0-400 lux.
  - .7 Daylight Sensing Coverage: Light input within 60° cone.
  - .8 Occupancy Detection Technology: Passive infrared.
  - .9 Occupancy Detection Coverage Area: 600 sq. ft. or 1,200 sq. ft.
  - .10 Occupancy Detection Angle: 360°.
  - .11 Mounting: Junction box or ceiling tile.
  - .12 Groups: The set of fixtures controlled by a given multi-sensor shall be completely configurable through software and can span iLumin Plus network.
  - .13 Timers: All times shall be configurable through the web software and shall not require any manual configuration of settings prior to installation. Timer values can range from 1 second to 24 hours
  - .14 Shall be capable of occupancy forwarding to send occupancy status to other areas within the system
- .2 Product: [NC3-C]
- .1 Communication: iCANnet protocol.
  - .2 Power: From the iCANnet bus.
  - .3 Connections: Five (5) wires Belden 1502 or 1502P
  - .4 Sensing Technologies: Occupancy, daylight
  - .5 Daylight Sensing Range: 0-400 lux.
  - .6 Daylight Sensing Coverage: Light input within 60° cone.
  - .7 Occupancy Detection Technology: Passive infrared.
  - .8 Occupancy Detection Coverage Area: 250 sq. ft.
  - .9 Occupancy Detection Angle: 360°.
  - .10 Mounting: ceiling tile.
  - .11 Groups: The set of fixtures controlled by a given multi-sensor shall be completely configurable through software and can span entire iLumin Plus network.

- .12 Timers: All times shall be configurable through the web software and shall not require any manual configuration of settings prior to installation. Timer values can range from 1 second to 24 hours
- .13 Shall be capable of occupancy forwarding to send occupancy status to other areas within the system
- .14 Capable of sending a command to turn HVAC on and off

.3 ADDRESSABLE SENSOR POWERPACK

- .1 Product: [FLT-SP-MV-DC2], [FLT-SP-MV-DC1], [FLT-SP-347-DC2], [FLT-SP-347-DC1], [FLT-SP-240-DC2], [FLT-SP-24-DC1]
  - .1 Communication: DALI protocol.
  - .2 Power: 347VAC.
  - .3 Maximum Current Draw: 2 mA.
  - .4 Maximum number of sensors: Up to five (5) PIR or DT sensors are connected and report to the system as a single addresss.
  - .5 Connections: Two (2) wires (16/18AWG, FT6, non-twisted, non-shielded, non-polarized and plenum rated) connected to the DALI communication bus.
  - .6 Sensor connections: Five (5) wires (16/18AWG, FT6, non-twisted,non-shielded, non-polarized and plenum rated) connected to sensor for controls and addressing

.4 CEILING MOUNTED SENSORS

- .1 Product: [OAC-DT-2000-R], [OAC-DT-1000-R], [OAC-P-1500-R], [OAC-U-2000-R]
  - .1 Provide all necessary mounting hardware and instructions.
  - .2 Sensors shall be Class 2 devices.
  - .3 Connect up to five (5) sensor to the DALI Powerpack for power and signal back to the iLumin Plus system
  - .4 Device calibration and features:
    - .1 Sensitivity – 0-100% in 10% increments.
    - .2 Time delay – 1-30, self-adjusts to 10 min based on room occupancy.
    - .3 Test mode – Fifteen second time delay.
    - .4 Detection technology – PIR, Ultrasonic or Dual Technology activation and/or re-activation.
    - .5 Walk-through mode.
    - .6 Ultrasonic and Dual Technology Sensors utilize two independent sensor detection circuits simultaneously to ensure optimum performance, regardless of location or proximity to walls and structures.

- .7 Ultrasonic and Dual Technology Sensors utilize Variable Drive Circuitry (VDC) in cases of over saturation from misapplication, which automatically adjusts the volumetric output without reducing detection capability. Systems that reduce detection coverage area shall not be acceptable.
- .8 Automatically and continually self-adjust ultrasonic frequency to ignore specific frequency, continuous noise from airflow to prevent detuning which can lead to inadvertent lights out. Sensors that require detuning shall not be acceptable.
- .5 Device Status LEDs including:
  - .1 PIR Detection
  - .2 Ultrasonic detection
- .6 Manual override of controlled loads
- .7 Where specified, sensor packaging shall be 100% recycled [made entirely from post-consumer waste (100% post-consumer fiber content) as well as, 100% recyclable].
- .8 Sensors shall be RoHS compliant.
- .5 WALL/CORNER MOUNTED SENSORS
  - .1 Product: [OAWC-P-120W-R], [OAWC-P-009L-H-R], [OAWC-DT-120W-R],
    - .1 Provide all necessary mounting hardware and instructions.
    - .2 Sensors shall be Class 2 devices.
    - .3 Connect up to five (5) sensor to the DALI Powerpack for power and signal back to the iLumin Plus system
    - .4 Device calibration and features:
      - .1 Sensitivity – 0-100% in 10% increments.
      - .2 Time delay – 1-30, self-adjusts to 10 min. based on room occupancy.
      - .3 Test Mode – Fifteen second time delay.
      - .4 Detection technology – PIR, Ultrasonic or Dual Technology activation and/or re-activation.
      - .5 Walk-Through Mode.
      - .6 Automatically and continually self-adjust ultrasonic frequency to ignore specific frequency continuous noise from airflow to prevent detuning which can lead to inadvertent lights out. Sensors that require detuning shall not be acceptable.
  - .5 Device Status LEDs including:

- .1 PIR Detection
- .2 Ultrasonic detection
- .6 Manual override of controlled loads.
- .7 Where specified, sensor packaging shall be 100% recycled [made entirely from post-consumer waste (100% post-consumer fiber content) as well as, 100% recyclable].
- .8 Sensors shall be RoHS compliant.

## 2.5 **END DEVICES**

### .1 **ADDRESSABLE RELAYS AND DRIVERS**

- .1 Product: [FLT-DAC-DALI-DC1], [FLT-DAC-DALI-DC2]
  - .1 0-10V Addressable Dimming Modules
  - .2 Communication: DALI protocol.
  - .3 Power: From the DALI bus.
  - .4 Maximum Current Draw: 3.75 mA.
  - .5 Communication Connections: Two wires (16/18AWG, FT6, non-twisted, non-shielded, non-polarized and plenum rated) connected to the DALI communication bus.
  - .6 Power Ratings: Up to 4A Ballast 120/277/347 VAC.
  - .7 Dimming Control: 0-10V, 50 mA max current sink.
  - .8 Mounting: Fixture or conduit (90° elbow and mounting clips included).
  - .9 UL 924 Listed component.
- .2 Product: [FLT-HPRS-DALI]
  - .1 Communication: DALI protocol.
  - .2 Power: From the DALI bus.
  - .3 Maximum Current Draw: 3.75 mA.
  - .4 Enclosure: Standard outlet box or NEMA 250, Type 1, unless otherwise indicated.
  - .5 Communication Connections: Two (2) wires (16/18AWG, FT6, non-twisted,
  - .6 non-shielded, non-polarized and plenum rated) connected to the DALI communication bus.
  - .7 Power Ratings: Up to 20 A at 347 VAC.
  - .8 Field relays shall be capable of controlling plug loads.
  - .9 Mounting: Junction box.

## 2.6 **INTEGRATION AND ACCESSORIES**

.1 BAS INTEGRATION

.1 Product: [FPA-W34-1130] BMSPro 2 - BACnet Interface

- .1 The iLumin Plus network shall permit data protocol translation through a building automation interface Gateway. The BACnet Gateway shall permit BACnet communication protocol to operate individual areas, scenes or channels and read the status. The iLumin Plus network shall respond efficiently to the requested information from the BACnet network.
- .2 The BMSPro2 provides up to 10,000 points of control and can communicate to multiple panel types.
- .3 The BMSPro 2 requires a dedicated EG2 interface for connectivity either installed in an iLumin Plus panel or as a separate accessory.
- .4 Provide PIC list definition and object model to other system manufacturers.

.2 LAN/VLAN INTEGRATION

.1 Product: [EG2-NA] Ethernet Gateway

- .1 Shall provide a single ethernet port for connection to the building LAN or VLAN
- .2 Shall be capable of facilitating a LAN or Wi-Fi connection to the iLumin Plus system
- .3 Shall include an integral web server
- .4 Shall provide the capability for mobile devices to override the lighting system via scene or channel slider commands
- .5 Shall provide the capability for 3rd party integration via ASCII control strings
- .6 Shall provide the capability for bridging the iLumin Plus network across LAN or VLAN connections
- .7 Provide ability for bi-direction communication by means of Ethernet communication to system by means of user-supplied PC, digital audiovisual, or BAS equipment. Control to be located on the same Local Area Network.
- .8 Allow for custom communication command strings to be entered in to software to allow lighting control system to control other devices

.3 SERIAL INTEGRATION

.1 Product: [SI-2-NA] RS232 Interface

- .1 Communication: iCANnet protocol.
- .2 Power: From the iCANnet bus.
- .3 Connections: Five (5) wires Belden 1502 or 1502P
- .4 Mounting: Junction box

- .5 Provide ability for bi-direction communication by means of RS232 serial communication to system by means of user-supplied PC, digital audiovisual, or BMS equipment. Control to be located within 50 feet (15 meters) of RS232 source.
- .6 Allow for custom RS-232 command strings to be entered in to software to allow lighting control system to control any other device
- .4 PARTITION CONTROL;
  - .1 Product: [UIG-NA], [UIM-NA]
    - .1 Communication: iCANnet protocol.
    - .2 Power: From the iCANnet bus.
    - .3 Connections: Five (5) wires Belden 1502 or 1502P
    - .4 Inputs: Four (4) digitally optically isolated inputs
    - .5 Mounting: Junction box
    - .6 partitioning: Shall provide partitioning and room join capabilities using either a button press, input, or IR wall partition sensors
    - .7 Low Voltage Input: Shall provide the capability for contact closures to integrate between lighting controls and other systems.
      - .1 The contact closure input device will accept both momentary and maintained contact closures.
  - .2 Product: [IRTR]
    - .1 Infrared Transmitter & Receiver
    - .2 Provide the ability to sense the presence or absence of partitions.
    - .3 Requires the connection to a UIG-2-NA or UIM-NA
- .5 NETWORK ACCESSORIES
  - .1 Product: [LCNJ]
    - .1 Communication: iCANnet protocol.
    - .2 Power: From the iCANnet bus.
    - .3 Connections: Five (5) wires Belden 1502 or 1502P
    - .4 Mounting: Junction box
    - .5 Shall allow direct access to the iLumin lighting control network while in the space being modified.
  - .2 Product: [BN-2-NA]
    - .1 Network Bridge

- .2 Communication: iCANnet protocol.
- .3 Power: From the iCANnet bus.
- .4 Connections: Five (5) wires Belden 1502 or 1502P
- .5 Mounting: Junction box
- .6 Shall allow the network to extend more than 1000m/3200 feet.
- .7 Shall permit the connection of multiple networks allowing up to 65,000 devices on one system.

## 2.7 SOFTWARE

### .1 ICANsoft Suite

#### .1 Product: [SW-2]

- .1 Software shall support multiple functions to setup entire enterprise iLumin Plus system
  - .1 DALI addressing tool
  - .2 Device editor for system programming and scheduling
  - .3 iCANsoft editor for system programming and scheduling
  - .4 Smartphone configuration tool for mobile applications
  - .5 Touchscreen configuration tool
  - .6 Panel editor for floor plan control
- .2 Software shall support multiple diagnostic tools for troubleshooting the iLumin Plus system
  - .1 Network monitor
  - .2 Flash tool for updating system device firmware
  - .3 Device simulator
- .3 Shall include with user-friendly software suitable for operation on computer workstations which serve as central control stations for the selection and operation of lighting scenes
- .4 Clients shall interface with the software via Eaton Lighting Systems iCANsoft application

#### .2 Execution

## 2.8 INSTALLATION

- .1 Install equipment in accordance with manufacturer's installation instructions.
- .2 Provide complete installation of system in accordance with Contract Documents.
- .3 Define each dimmer's/relay's load type, assign each load to a zone, and set control functions.

- .4 Provide equipment at locations and in quantities indicated on Drawings. Provide any additional equipment required to provide control intent.
- .5 100 digital devices (Source Controllers, User Interfaces, etc) may reside on a single network segment with a network length not to exceed 3000 feet. Additional network segments shall be accomplished by the employment of a network bridge up to 65000 devices. Network segments shall be terminated at the end of each segment.
- .6 Devices to be connected via Daisy Chain topology.
- .7 Network wire recommended is Belden#1502R or 1502P (plenum) or similar. Wire shall meet color code requirements to insure proper installation of the network polarity.
- .8 All panels are "masters" and may be added to the network in any location and any amount as long as network installation guidelines are met.
- .9 Panels are designed to function independently from external control devices.

End of Section

(THIS PAGE INTENTIONALLY LEFT BLANK)

# Electrical

# Lighting Control Sequence

IDEN. No	AREA	CONTROLS	SEQUENCE
1	Corridors	Local low voltage switches Occupancy sensors Low voltage relays Time of day schedule	ON: 50% by time of day schedule; remaining 50% by occupancy sensor when space is occupied  ADJUST: Reduced to 50% when space is not occupied, increased to 100% when occupied  OFF: by time of day schedule  OVERRIDE: local manual switches to override ON when scheduled OFF
2	Washrooms; Janitor Room	Local low voltage switches Low voltage relays Vacancy sensors	ON: manual by local switches  OFF: vacancy sensors
3	Private Offices	Local dimming type wall switch sensor or vacancy sensor & dimming switch as indicated on drawings Photocells where Primary and/or Secondary sidelighting is available Low voltage relay	ON: 100% manual by local wall dimmers/dimming sensor  ADJUST: Local dimmer; photocell where daylighting is available  OFF: vacancy sensor
4	Open Offices; Copy/Print Rooms	Local dimming switches preset for 50% ON, 100% ON, OFF (no additional manual adjustment) Photocells where Primary and/or Secondary sidelighting is available Vacancy sensor Low voltage relays	ON: manual by local dimming switches  ADJUST: Local dimmer (2 levels only); photocell where daylighting is available  OFF: by switch or vacancy sensor
5	Meeting Rooms, Conference Rooms, Multipurpose rooms	Local dimming switches Photocells where Primary and/or Secondary sidelighting is available Vacancy sensor Low voltage relays	ON: manual by local dimmer switches  ADJUST: Local dimmers; photocell where daylighting is available  OFF: vacancy sensor, and manual override by local dimmer switches
6	Mechanical, Electrical, Comms. Rooms	Local low voltage switch Low voltage relay	ON: Manual by local control  OFF: Manual by local control or schedule
7	Lobby, Vestibule	Local low voltage switch Occupancy sensor Photocell where daylighting is available Low voltage relays Time of day schedule	ON: 50% Auto on by schedule; remaining 50% by occupancy sensor when space is occupied  ADJUST: Dimmed to 50% by occupancy sensor when not occupied; dimmed by photocell in response to daylighting  OFF: time of day schedule  OVERRIDE: local manual switch to override ON when scheduled OFF
8	Storage up to 1000 sq ft	Local wall switch or sensor switch Vacancy sensors Low voltage relays	ON: Manual on using local switch;  OFF: Auto off using vacancy sensors when space is not occupied
9	Exterior	photocell Low voltage relays time-of-day schedule	ON/OFF: by time of day schedule and photocell  REDUCE: dimmed by time of day schedule

- 1 General
- 1.1 **SUMMARY**
  - .1 Section Includes
    - .1 Labour, Products, equipment and services necessary to complete the Work of this section.
- 1.2 **ALTERNATE PRODUCTS**
  - .1 Submit a Tender Bid based on the use of Products indicated as base system Products.
  - .2 Voluntarily submit an alternative Bid based on the use of Products indicated as alternative Products. Indicate in the Bid Form, the change in Bid Price by the use of alternative Products. By submitting a Bid based on alternative Products the Bidder accepts responsibility for coordination and interferences that may arise from their use.
- 1.3 **SYSTEM DESCRIPTION**
  - .1 Pathways – Hangers and Supports
    - .1 Supports for structured cabling to segregate cabling from electrical and mechanical sources of interference or sources of potential damage.
  - .2 Open Hook Hangers
    - .1 Open hook hangers (J hooks) permitted only where expressly indicated.
    - .2 Open hook hangers (J hooks) only of the type expressly indicated.
  - .3 Cable Retention Wraps
    - .1 Cable retention wraps permitted only of the type and where expressly indicated.
    - .2 Cable retention wraps permitted only of the type indicated.
    - .3 Hard nylon cable retention wraps (Tiewrap™) or like Products not permitted as communications cable retainers nor permitted to be in direct contact with cable jacket.
  - .4 Pathways – Conduits
    - .1 Comply with Section 26 05 00.
    - .2 Metallic and non-metallic conduit and cable tray to TIA 569.
    - .3 Flexible conduits at building expansion joints, connections from overhead pull-boxes to furniture access poles, and between wall pass-through boxes and modular systems furniture assemblies.
    - .4 Flexible liquid-tight metallic conduit for isolation and protection of communications cables between outlet boxes and enclosed raceways installed below access floors in areas not designated as a computer room.
  - .5 Pathways – Conduit Device Boxes
    - .1 Comply with Section 26 05 00.
    - .2 Metallic and non-metallic device boxes to TIA 569.
    - .3 Device boxes of sufficient depth and width to prevent cable curvature in breach of manufacturer's specification for bending radius.
    - .4 Device boxes of sufficient capacity to permit storage of cable working allowance without interference to outlets and terminations.

- .6 Pathways – Cable Tray and Cable Runway
  - .1 Overhead cable tray in telecommunications rooms and computer rooms where indicated.
  - .2 Overhead cable runway in finished and unfinished areas where indicated.
  - .3 Under floor cable tray in finished areas with access floor where indicated.
- .7 Pathways – Ducts
  - .1 Comply with Section 26 05 53.
  - .2 Underground and buried duct conduit and services to TIA 569.
  - .3 Ducts installed complete with flexible inner-duct sleeving and marked mule tape.
- .8 Grounding and Bonding
  - .1 Comply with CSA C22.1.
  - .2 Grounding and bonding to TIA 607.
  - .3 Comply with Telcordia GR-295-CORE
  - .4 Provide technical single point ground as telecommunications systems ground reference.
    - .1 Grounding and bonding system for telecommunications to achieve an independent electrical grounding and bonding scheme separate and isolated from other grounds including building ground, lightning ground, process and controls ground or grounds, with exception that technical ground and electrical safety ground bonded at single point only, being closest to the source of incoming electrical power or as indicated.
    - .2 Technical grounding bus bars in telecommunications rooms, computer equipment rooms, telecommunications carrier building entrance and service rooms.
    - .3 Main technical grounding bus bar(s).
    - .4 Bonding conductors between technical grounding bus bars and main technical grounding bus bar as indicated using conductor of size whichever is greater of #6 AWG or as required by electrical safety code or as indicated on the Contract Drawings.
    - .5 Bonding between main technical grounding bus bar and electrical safety ground.
    - .6 Computer and communications equipment cabinets bonded to technical ground.
- .5 Common Electrical Ground
  - .1 Overvoltage protection building entrance devices bonded to electrical power safety ground.
  - .2 Communications metallic conduits, cable trays, cable runways, electrical enclosures, raceways bonded to electrical power safety ground.
  - .3 Electrical enclosures with the exception of computer and communications equipment cabinets bonded to electrical safety ground
  - .4 Grounding conductors in buried telecommunications ducts bonded to electrical safety ground.

.6 Pathways

- .1 Communications cable tray, cable runway, bonded to electrical safety ground through continuous minimum 10 AWG copper conductor. Bonding at intervals of 2440 mm or less.

.9 Submittals

- .1 Comply with Section 01 33 00.
- .2 Affix Engineer's seal or RCDD stamp of qualified persons identified herein to all submissions tendered under this division of the work to indicate work submitted has been reviewed by the qualified person. The indicated engineer seal or RCDD stamp in addition to seal or stamp required under provincial law.
- .3 Submit the following:
  - .1 Prepare and submit detailed and dimensioned drawings to describe and illustrate coordination of overhead communications systems, including but not limited to:
    - .1 Overhead support grid and suspension.
    - .2 Overhead cable tray.
    - .3 Overhead cable runway.
    - .4 Insulators.
    - .5 Top of equipment cabinets, frames and racks.
    - .6 Exhaust air containment ducts, flexible and rigid.
    - .7 Ceiling mounted AC units.
    - .8 Lighting fixtures.
    - .9 Overhead power distribution cables.
    - .10 Overhead power distribution busway.
    - .11 Overhead power tap boxes.
    - .12 Overhead optical fibre cable troughs and down drops.
    - .13 Overhead patch panels.
    - .14 Cable entry cable chimney to equipment cabinets.
  - .2 Shop Drawings
    - .1 Submit Shop Drawings for all component types prior to their use on site.
    - .2 Drawing illustrating front elevation of rack layouts prior to assembling said equipment.
    - .3 Drawing illustrating equipment room layouts where different from Contract Drawings. Identify dimensions of clearances to front, rear and sides of floor mounted components.
    - .4 Drawings illustrating cabling identification scheme prior to use on site.
- .4 Working, progress and constructed drawings
  - .1 Site maintained working progress drawings for Consultant's review when requested. Site maintained copy of site instructions, Change Orders,

Change Directives, minutes of site and trades coordination meetings for Consultant's review when requested.

.2 "As-Constructed" Record Drawings.

- .1 Prepare and submit drawings in hard copy format and in electronic machine readable Computer Aided Drafting (CAD) format describing the work as completed. Submit drawings in AUTOCAD format of release level no older than two versions prior to current release. Request copy of standards and conventions for use when creating and maintaining CAD files. Comply with layer conventions as indicated in CAD standards and practices documentation, or use existing layering conventions in existing files when machine readable files are available.
- .2 Where wires or communications raceways are underground or under floor or below finished grade, furnish field dimension with respect to building column lines and inverts with respect to finished floor levels or grades. Indicate inverts at point of penetration of conduits into below-grade hand wells, or below-grade maintenance chambers.
- .3 Record deviations from cable numbers shown on the Contract Drawings.
- .4 Prepare records of interconnecting and cross-connecting wiring between items of equipment including equipment supplied by Owner and under other Specification sections. Provide the records loaded into a data base. Select the data base by mutual agreement with the Consultant.
- .5 Approved data base Products
  - .1 Microsoft Access
  - .2 Microsoft Excel
  - .3 Flat ASCII text file in CSV format
- .6 Prepare drawings clearly identifying routes taken by cable where the cable is not supported along its length by an approved electrical raceway.
- .7 Submit Record Drawings no later than ten days following submitting a claim for Substantial Performance.

.5 Test reports

- .1 Submit test reports within three days of testing.

.6 Manuals

- .1 Submit Operating and Maintenance Manuals.

1.4 **TENDER SUBMISSIONS**

.1 Tender submissions from pre-qualified bidders

- .1 Submit a Tender to undertake work described under this division only if pre-qualified by the Owner.
- .2 Tenders to undertake this work will be accepted from other bidders only if accompanied by written approval from the Owner to have Tender Bid considered.

.2 Tender submissions from bidders at large

- .1 Submit a Tender to undertake work described under this division only if:
  - .1 Fully qualified and certified to undertake the work by the manufacturer(s) of the Product(s) proposed in the Tender;
  - .2 Compliant with bidder qualifications required and outlined herein below.

#### 1.5 **PRE-AWARD SUBMISSIONS**

- .1 On request of the Owner submit the items listed herein before award of Contract as a condition of award. Failure to comply will be justifiable grounds for cancelling the Contract or disqualification of the bid at the sole discretion of the Owner.
- .2 Submit the following items prior to, or no later than ten working days following, the award of Contract.
  - .1 **Personnel**
    - .1 Submit a list of personnel who will be directly involved in overseeing the technical interpretation of the work described in the Contract Documents.
    - .2 Submit a list of personnel who will be directly involved in assessing the quality of the work during execution and in ensuring quality standards are upheld.
    - .3 Submit a statement indicating that the Bidder maintains the minimum number of trained installation technicians to comply with the structured cabling system manufacturer's business partner or certified partner program. Provide information on the manufacturer's requirements.
    - .4 Submit a list of trained personnel who will or may be assigned to the Project. Indicate the degree of training each technician has received and whether training was factory training or in-field. Submit for each person named, a record of factory training credentials issued by the named manufacturer(s) stating training curriculum and date of training applicable to the Products identified.
    - .5 Submit for each person named, professional and/or industry recognized credentials endorsing the ability and competency to undertake quality assurance, overseeing and technical guidance of the work.
  - .2 **Corporate**
    - .1 Submit a list to identify five or more like-sized systems undertaken by the Bidder. Identify the completion date of each. Provide on demand a reference who can and is willing to attest to the quality of the work results for each named project.
  - .3 **Manufacturer**
    - .1 Submit a statement from the manufacturer of the cabling Products proposed for use in this Contract indicating the Bidder's good standing with the manufacturer and the manufacturer's willingness and agreement to underwrite the performance warranty on the final installation.
    - .2 Failure to comply within ten working day following award may result in the disqualification of the bid at the sole discretion of the Owner.

#### 1.6 **CONTRACTOR QUALIFICATIONS**

- .1 At any time before date of award or within ten business days following the date of award of Contract, submit the name of one or more persons who are qualified to undertake the work to implement and oversee the work of this division and described in the Contract Documents.

- .2 Identify one or more persons to fulfil two identified roles. Acceptable for both roles to be fulfilled by one person.
  - .1 Technical design supervisor
  - .2 Site work supervisor
- .3 Acceptable qualifications are:
  - .1 Active member of BICSI and currently registered under BICSI RCDD program. Acceptable form of statement is RCDD certificate expiring no sooner than the date of substantial completion or one full year following the date of award whichever is the later.
  - .2 Active individual member or corporate member of BICSI and licensed within Canada as Professional Engineer with ten years demonstrated practice in the field of design and installation of communications infrastructure. Acceptable form of statement is an image of the signed Professional Engineer seal as cover to a history of work undertaken similar in nature and scope to the work described in the Contract Documents.
- .4 Provide commitment to maintain same personnel or direct and immediate replacements through period of Contract. Acceptable replacements include personnel possessing like credentials for term including construction period.
- .5 Provide commitment that qualified personnel will execute a tenure of commitment expiring no less than one year from the date of award, or a period conterminal with the final completion of the work whichever is the sooner.
- .6 Quality assurance.
- .7 Pre-Installation Meetings
  - .1 Arrange for and attend pre-installation design and construction meetings. Attendees at meetings to include site work supervisor and technical design supervisor.
    - .1 Minimum of one meeting to review the Contract scope of work.
    - .2 Minimum of one meeting to review the proposed execution of the work.
- .8 Site Meetings
  - .1 Arrange for and attend construction progress meetings. Attendees at meetings to include site work supervisor and technical design supervisor.
    - .1 Minimum of two site meetings per month commencing on day of mobilization and running until four weeks after site work completion.
  - .2 These Specifications supplement the Electrical and Electronic Manufacturers Association of Canada, Canadian Standards Association Standards, Electronic Industries Association, Telecommunications Industries Association standards and recommendations. Conditions of the EEMAC, CSA, EIA, TIA and ISO/IEC standards and recommendations apply unless superseded or modified by this Specification.
  - .3 Where requirements of the Specifications exceed referenced standards, the Specifications apply. Where standards differ between authorities, the most stringent applies.
  - .4 Requirements of the Specifications that are substandard to referenced standards should be brought to the attention of Consultant during bidding period in sufficient time to allow suitable action to be taken and addenda issued as necessary.
  - .5 Equipment must be acceptable to electrical inspection authorities.

- .6 Where any part of the Work fails tests, on approval of the manufacturer repair the fault in a manner to prevent recurrence and re-test.
- .7 Where any part of the Work fails tests and that Work is to be built without physical discontinuity, remove the offending material and install new without increase in cost to the Contract.
- .9 Area Classification
  - .1 No area in the Work is classified as hazardous.
- .10 Warranty
  - .1 Comply with the terms of the warranty described in the Contract Documents.
  - .2 All components comprising the structured cabling channel as defined by TIA 568 by one manufacturer only and under the protection of a single installation and performance warranty.
  - .3 Provide Products protected under a single warranty where providing such is of benefit to the Owner. Provide evidence of this benefit.
  - .4 Assemble the cabling system using Products protected by a single warranty of minimum twenty-five years.
  - .5 Warranty to include protection against defective manufacture of Products and guarantee of fit for purpose for present and future uses for cable of stated performance level. Warranty to protect the Owner from defects in Product made evident by long term exposure to operating environment for which the Product is specified.
  - .6 Do not propose the use of Products or to provide contracting services if the manufacturer of the Products proposed will not warrant the Work to the best warranty most beneficial to the Owner.
- 2 Products
  - 2.1 **MANUFACTURERS**
    - .1 Use Products manufactured by stipulated manufacturer where identified.
    - .2 Use Products manufactured by the identified preferred manufacturer as the basis of the Base Bid.
    - .3 Use Products manufactured by identified alternative manufacturers as the basis of voluntary alternative bids. Provide justification for the use of alternative Products.
    - .4 Avoid substitution of Products that are not beneficial to the Contract. Demonstrate benefit to the Contract and obtain approval prior to use of Products not identified in the Contract Drawings.
  - 2.2 **ACCEPTABLE MANUFACTURERS**
    - .1 Submit a Tender that includes only those Products identified in this and related sections in this division of the Specification.
    - .2 All components comprising the structured cabling channel as defined by TIA 568 by one or more manufacturers and under protection of a single installation and performance warranty.
  - 2.3 **PRODUCT VENDORS**
    - .1 Provide Products by a sole stipulated manufacturer where indicated.
    - .2 Provide Products by listed alternative manufacturers where indicated for voluntarily proposed alternates. Acceptable alternative Products are listed within this and other sections comprising this division of the Work.

- .3 Use of Products not identified in this division as substitutes for stipulated or preferred Products is at the risk of the Contractor. At the discretion of the Owner, the Contractor may be called to replace the substituted Products at no cost to the Owner. A claim by the Contractor for a time delay caused by the need to replace substituted Products will be rejected.
- .4 For each alternative Product submit justification for use as alternates indicating benefits to the Owner. Identify if benefits are based on price, delivery, or performance.

2.4

**COMMUNICATIONS GROUNDING AND BONDING**

- .1 Pre-drilled Copper Bus Bar
  - .1 Telecommunications Grounding Busbar (TGB)
    - .1 Type T-250
      - .1 250 mm TGB telecommunications grounding bus bar, 6.5 x 50 x 250 mm, tin plated; four sets holes 6 mm diameter, spaced 16 mm; three sets of 10 mm holes spaced 25 mm, standoff insulators and mounting brackets.
    - .2 Type T-300
      - .1 300 mm TGB telecommunications grounding bus bar, 6.5 x 50 x 305 mm, tin plated; six sets holes 6 mm diameter, spaced 16 mm; three sets of 10 mm holes spaced 25 mm, standoff insulators and mounting brackets.
    - .3 Type T-500
      - .1 500 mm TGB telecommunications grounding bus bar, 6.5 x 50 x 508 mm, tin plated; twelve sets holes 6 mm diameter, spaced 16 mm; three sets of 10 mm holes spaced 25 mm, standoff insulators and mounting brackets.

Table 1 - Telecommunications ground bus bar - by manufacturer

Type	Panduit		
T-250	GB2B0304TPI-1		
T-300	GB2B0306TPI-1		
T-500	GB2B0312TPI-1		

- .2 Telecommunications Main Grounding Bus Bar (TMGB)
  - .1 Type TM-300
    - .1 300 mm TMGB telecommunications main grounding bus bar, 6.5 x 100 x 305 mm, tin plated; twelve sets holes 6 mm25 diameter, spaced 16 mm; six sets of 10 mm holes spaced 25 mm, standoff insulators and mounting brackets.
  - .2 Type TM-500
    - .1 500 mm TMGB telecommunications main grounding bus bar, 6.5 x 100 x 508 mm, tin plated; twenty-four sets holes 6 mm diameter, spaced 16 mm; six sets of 10 mm holes spaced 25 mm, standoff insulators and mounting brackets.

Table 2 - Communications main ground bus bar - by manufacturer

Type	Panduit		
TM-300	GB4B0612TPI-1		
TM-500	GB4B0624TPI-1		

- .3 Two-hole long barrel lug
  - .1 Comply with BICSI/J-STD-607A.
  - .2 Tin plated long barrel with inspection window to confirm cable insertion; two holes according to NEMA size and spacing.

## 2.5 **PATHWAYS FOR COMMUNICATIONS SYSTEMS**

- .1 General
  - .1 Comply with Section 27 11 00 for overhead cable runway.
  - .2 Comply with Section 26 05 00 for rigid overhead cable tray.
  - .3 Supplement approved electrical raceways with items described herein.
- .2 Cable Hangers and Supports
  - .1 Use only where expressly indicated as permitted.
  - .2 Cable supports of open hook construction (J hooks) with 54 mm wide cable bearing surface curved with radius greater than minimum required by supported cable.
  - .3 Listed manufacturers and Products:
    - .1 Panduit: JM2H2-X
    - .2 Ideal
  - .4 Cable retention wraps, soft, reusable hook-and-loop tie, coloured to match colour code indicated. Plenum rated.
    - .1 Panduit: HLTP and HLSP series
  - .5 Nylon cable retention wraps (Tiewraps™) not permitted.
- .3 Conduit Guard
  - .1 Plastic protection press-on bushings to suit EMT and rigid galvanized steel conduit; size to suit conduit to maximum 103 diameter. Suitable for use in air supply or return plenum spaces.
- .4 Flexible Corrugated Non-metallic Conduit
  - .1 Nominal inside diameters 25 mm, 32 mm.
  - .2 Fire ratings FT4, FT6.
  - .3 Manufacturer:
    - .1 Arlington
- .5 Flexible Fabric Thin Wall Inner Duct Sleeve
  - .1 White with colour identification stripe including pull tape in one-, two-, three-cell on micro-cell format.
  - .2 Fire ratings of normal, riser and plenum with optional copper 18 gauge tracing strips.
  - .3 Listed manufacturer and Products:
    - .1 Max cell
      - .1 Three-cell: 103 mm MXC4003XX series
      - .2 Three-cell: 78 mm MXC3456XX series
      - .3 Two-cell: 53 mm MXC2002XX series

- .4 Micro two-cell: 27 mm MXCM3302XX series
- .6 Flexible Liquid-tight Metallic Conduit
  - .1 Corrugated heavy gauge electro galvanized flexible steel strip helically wound conduit with integral copper bonding wire and PVC jacket, colour blue or grey in nominal inside diameter sizes 21 mm, 25 mm, 32 mm, with fire ratings FT4, FT6, to CSA C22.2 No. 0.3.
  - .2 Manufacturers:
    - .1 Delikon, Type YF-604
- .7 Flexible Metallic Conduit
  - .1 Corrugated heavy gauge electro galvanized flexible steel strip helically wound conduit with integral copper bonding wire in nominal inside diameter sizes 21 mm, 25 mm, 32 mm.
  - .2 Manufacturers:
    - .1 Delikon, Type YF-504
- .8 Cable Trays for Communications Systems
  - .1 Rigid ladder tray
    - .1 Comply with Section 26 05 00 and Section 26 05 33.
  - .2 Rigid solid bottom cable tray
    - .1 Comply with Section 26 05 00 and Section 26 05 53.
  - .3 Open wire mesh cable tray
    - .1 Form
      - .1 Tray formed of circular or ovaloid steel wire welded to form grid pattern of nominal 50 mm x 100 mm
      - .2 Folded sides to provide longitudinal structural support
      - .3 Widths ranging from nominal 200 mm to nominal 600 mm
      - .4 Fixed or snap-on cable retention side wall depths ranging from 50 mm to 150 mm
      - .5 Standard lengths of nominal 3 m
    - .2 Finishes:
      - .1 Painted black, white
      - .2 Zinc electroplated
    - .3 Certifications
      - .1 ULc or UL Canada or Certification acceptable to the AHJ
      - .2 CSA 22.2 No 126.1 Metal Cable Tray Systems
      - .3 NEMA VE 1
    - .4 Accessories
      - .1 Accessories as required
        - .1 Splicing kit
        - .2 Edge hanger

- .3 Cantilever brackets
- .4 Underfloor C bracket
- .5 Split bolt grounding lug and clamp
- .6 Divider
- .7 Radius drop
- .8 Side bracket
- .9 Radius control side wall brackets
- .10 Vertical radius bracket
- .11 Conduit bracket
- .12 Solid liner insert
- .13 Side supported cable hanger brackets

.5 Manufacturer

- .1 CPI Chatsworth
- .2 T&B Thomas and Betts
- .3 Legrand
- .4 Panduit

2.6 **UNDERGROUND DUCTS AND RACEWAYS FOR COMMUNICATIONS**

- .1 Comply with Section 26 05 00 and Section 26 05 53.
- .2 Rigid PVC Conduit
  - .1 Rigid PVC conduit manufactured to CSA C22.2 No. 211.2
  - .2 Rigid PVC fittings, long sweep bend
- .3 Rigid Ferrous Metal Conduit with PVC Coating
  - .1 Rigid ferrous metal conduit to CSA C22.2 No. 45-M with PVC coating to nominal thickness of 1.02 mm conforming to NEMA publication RN1-1998
  - .2 Matching rigid ferrous metal PVC coated fittings and couplings; matching long sweep bends
- .4 Underground Enclosure
  - .1 Precast polymer concrete underground enclosure
  - .2 Precast polymer concrete enclosure reinforced with glass fibre, to 9072 kg loading application, open base, tamperproof cover locks
  - .3 Width: 305 mm square; depth: 457 mm, 609 mm, 913 mm
  - .4 Manufacturers:
    - .1 Synertech

3 Execution

3.1 **DIMENSIONS AND QUANTITIES**

- .1 Dimensions shown on Drawings are approximate. Verify dimensions by reference to Shop Drawings and field measurement.
- .2 Quantities or lengths indicated in any of the Contract Documents are approximate only.

- .3 Make necessary changes to routing of cables and the like to accommodate structural, mechanical, electrical and architectural conditions. Coordinate with other trades and make allowance for conditions that will arise from work in progress under separate contract.
- .4 Plan cable pathway routing to ensure compliance with cable performance specifications, reference standards, and to avoid electromagnetic interference effects.
- .5 Report to the Engineer immediately upon identification of any condition that may result in the performance criteria of the cabling being compromised.
- .6 Install measuring tape for full length of communications pathways in those pathways approaching cable performance distance limits. Measure length and confirm that distance limits are not exceeded.
- .7 Mark up areas on communications rooms backboards to indicate locations for installation and mounting of communications terminal blocks, security related devices and electronic equipment, public address and paging related equipment and terminal blocks and areas allocated for public carrier for overvoltage protection devices, demarcation terminal blocks and CATV distribution and amplification devices. Use removable tape to prepare proposed layout for Consultant's review. Overlay with black permanent marker after review by Engineer.

3.2

**COMMUNICATIONS GROUNDING AND BONDING**

- .1 General
  - .1 Install grounding and bonding to comply with Ontario Electrical Safety Code and all applicable codes.
  - .2 Install inside grounding cables and conductors in electrical raceways, cable trays, cable runways, or in rigid PVC conduits as indicated. Install outside grounding cables and conductors in PVC rigid conduit or direct buried as indicated.
  - .3 Install inside grounding to comply with BICSI/JSTD-607-A, TIA-607 and BICSI published Telecommunications Design Methods Manual.
  - .4 Install outside grounding to comply with BICSI published Customer Owned Outside Plant Manual (latest edition).
- .2 Bus Bars
  - .1 Mount bus bars insulated from building ground and in locations and at elevations indicated.
  - .2 Mount horizontally with fasteners able to resist axial pull of 50 kgf.
  - .3 Ensure clearance of 50 mm from other metallic objects including components of dissimilar grounding systems.
- .3 Enclosures
  - .1 Bond communications enclosures only to telecommunications ground bus bar. Do not bond directly to electrical safety ground.
  - .2 For arrays of four or fewer communications cabinets, connect individual #6 grounding cables between technical grounding bus bar and individual communications cabinets.
  - .3 For arrays of five or more communications cabinets, connect individual #6 grounding cables between individual cabinets and a common #2 AWG insulated aisle ground cable using crimp taps. Connect aisle ground cable to technical ground bus bar using two-hole long barrel lug with window.
- .4 Communications Shields

- .1 Bond communication shields to technical ground at both terminations when sharing a common single point ground system. Bond communications shield to technical ground at termination distant from work area outlets when terminations do not share a common ground system.
- .2 Make grounding connections to telecommunications cable conductive shields as indicated, using components designed for purpose and following manufacturer's instructions.
- .3 Protect finished communications grounding against making unwanted connections to dissimilar grounding systems.
- .5 Flexible Conduits
  - .1 Bond armour and bonding wire to ground through manufactured conduit accessories.
- 3.3 **ELECTRICAL SAFETY GROUND**
  - .1 Bond electrical conduit for telecommunications, cable trays for telecommunications, cable runways directly to electrical safety ground. Do not bond directly to technical ground.
  - .2 Bond main technical ground bus bar to electrical safety ground.
- 3.4 **PATHWAYS FOR COMMUNICATIONS SYSTEMS**
  - .1 General
    - .1 Pathways laid out and installed to comply with latest release of ANSI/TIA 569.
    - .2 Pathways run lengths to comply with latest release of ANSI/TIA 568. Notify Engineer in event of any inside path length exceeding 90 m.
    - .3 Inside pathways installed parallel or perpendicular to building lines.
    - .4 Submit drawings of proposed installation, and indicating deviation from cable routing shown on drawings to the Engineer for review prior to commencing installation.
    - .5 Maintain minimum clearances measured from any point of the communications system to any point on the outer container of electrical and heat sources.
 

.1	Unit substations	10 m
.2	Power transformers enclosure (greater than 30 kVA)	10 m
.3	Transformers enclosures (up to 30 kVA)	1.2 m
.4	Motors casings (greater than 1 HP)	10 m
.5	Motors casings (up to 1 HP)	1.2 m
.6	Switch gear enclosures (greater than 600V)	10 m
.7	Feeder cable / conduit (600V and above)	1 m
.8	Distribution cable / conduit (less than 600V)	750 mm
.9	EMT conduit (enclosing 30A branch circuits)	300 mm
.10	ENT conduit (enclosing 30A branch circuits)	450 mm
.11	AC90 cable (enclosing 30A branch circuits)	450 mm
.12	EMT conduit (enclosing 20A branch circuits)	75 mm
.13	ENT conduit (enclosing 20A branch circuits)	150 mm
.14	AC90 cable (enclosing 20A branch circuits)	150 mm

- |     |   |        |
|-----|---|--------|
| .15 | EMT conduit (enclosing 15A branch circuits) | 65 mm  |
| .16 | ENT conduit (enclosing 15A branch circuits) | 100 mm |
| .17 | AC90 cable (enclosing 15A branch circuits)  | 100 mm |
| .18 | Control cabling (in separate conduit)       | zero   |
| .19 | Control cabling (exposed)                   | 100 mm |
| .20 | Class 2 wiring (in separate conduit)        | zero   |
| .21 | Class 2 wiring (exposed)                    | 100 mm |
| .22 | Conduit (all others)                        | 75 mm  |
| .23 | Fluorescent luminaires                      | 600 mm |
| .24 | Pipes (gas, oil, water, etc.)               | 300 mm |
| .25 | HVAC (equipment, ducts, etc.)               | 150 mm |
- .2 Cable Protection
- .1 Provide protective cable sleeving to prevent damage to cables at transition from cable tray, conduit, pull box, junction box, maintenance hole, pull point. Provide sleeve to reduce friction, bending and crushing forces. Install split sleeve where impracticable to install solid.
- .3 Cable Hangers and Supports
- .1 Where expressly indicated, support cables by use of cable hangers. Space hangers at maximum 1 m separation.
- .2 Limit cables to twenty-four per hanger.
- .3 Apply cable retention wraps without causing tension, pressure or other deformation of cable and cable bundles. Complete wrap with 100 mm overlap. Spacing between wraps not more than 1.2 m except for cables in horizontal cable tray. Avoid wrapping cables in bundles in horizontal sections of cable tray. Secure cables in bundles in vertical portion of cables tray with supports at spacing of not more than 600 mm. Place and secure cables in tray to prevent edges pressing against cable jacket.
- .4 Do not use nylon cable retention wraps (Tiewraps™) for cable retention.
- .4 Conduit
- .1 Extend distribution and backbone conduit to cable tray.
- .2 Form field-formed raceway to comply with TIA 569 specifications.
- .3 Fit conduit guard bushings on each exposed entrance to conduit raceway.
- .4 Field form "gooseneck" bends in conduit where surface run conduit changes direction to penetrate a wall or partition at ninety degrees. Assume the gooseneck bend includes one hundred eighty degrees of bending.
- .5 Innerduct Sleeving
- .1 Provide and install flexible corrugated non-metallic conduit for protection against abrasion and bending, and as protection of optical fibre cables in open cable tray. Colour: Orange except black or grey where indicated; inside diameter: 25 mm except 32 mm where indicated; fire ratings: FT6 except FT4 where indicated.
- .2 Provide and install flexible fabric low friction pre-lubricated inner duct sleeve in all backbone conduits and in conduits intended to carry backbone cabling, and in all

conduits below grade and also where indicated. Colour coded, with pre-installed pulling tape; electrically traceable where indicated.

- .1 Three-cell construction for installation in 103 conduits
- .2 Three-cell construction for installation in 78 conduits
- .3 Two-cell construction for installation in 54 conduits
- .4 Micro two-cell construction for installation in 27 conduits

.6 Flexible Metallic Conduit

- .1 Flexible non-combustible metallic liquid-tight conduit permitted below access flooring as pathway between communications raceways and individual outlet device boxes.
- .2 Install conduit of trade size as indicated on the drawings or described in the Specification or 21 mm diameter whichever is the greatest.

.7 Flexible Non-metallic Tubing

- .1 Flexible non-metallic tubing not permitted in damp or wet locations.
- .2 Flexible non-metallic cable not permitted between locations separated by greater than 150 m.
- .3 Flexible non-metallic electrical tubing not permitted where aggregated bending exceeds one hundred eighty degrees.
- .4 Acceptable use of flexible non-metallic tubing as replacement for rigid non-metallic conduit when minimum of one trade size larger than required size of indicated rigid conduit.
- .5 Flexible non-metallic tubing permitted if maximum permitted pull tension of installed cable is not exceeded. Provide pull tension reports to the Engineer on request.
- .6 Flexible non-metallic tubing installed complete with colour identified and measured mule tape.
- .7 Mule tape incorporating copper tracing conductor for use in non-metallic tubing.

3.5 **UNDERGROUND DUCTS AND RACEWAYS**

.1 General

- .1 Clean out each section of duct by pulling a steel wire brush and mandrel of the correct size through the duct before pulling cables.
- .2 Notify the Engineer if immovable obstructions are encountered when cleaning existing ducts.
- .3 Protect cable at entry and exit from ducts by flexible corrugated non-metallic conduit.
- .4 Install pull string with length markers ("Mule tape") in each duct and in each inner-duct where applicable.
- .5 Conduit ducts below concrete slab on grade at minimum 300 mm below finished concrete floor or 100 mm below lowest elevation of concrete, whichever dimension is the greater.

.2 Cable Placement in Underground Ducts

- .1 Pull cables in underground ducts in continuous length, without splicing.

- .2 Install cables in lower ducts first, leaving upper ducts for future; install cables in inner-ducts where provided.
- .3 Apply only manufacturer recommended or approved lubricant to cables to reduce friction between the cable and the duct.
- .4 Apply cable grips with ball bearing swivel to the cable sheath or strength members to avoid applying tensile force directly to conductors or fibres when pulling cables.
- .5 Station personnel at each access point to observe and lubricate the cables during pull.
- .6 Provide cable slack at manholes for expansion and contraction; mount with clips to prevent sagging.
- .7 Submit tension pulling calculation prior to installation of cables to Consultant for review.
- .8 Monitor cable pull tension during installation. Do not exceed maximum tensile rating of cables.
- .9 Avoid bending cables to a radius less than manufacturer's recommendation, or ten times the cable outside diameter, whichever is the greater.
- .10 Where cable is pulled through a distance of greater than 30 m or through a pathway containing more than one ninety degree bend, use a dynamometer to record installation tension and a tension limiting device to prevent exceeding the maximum pulling tension specification during installation. Set the tension limit at or below the manufacturer's maximum limit. Take up the cable at intermediate pulling points with an intermediate cable take-up device reviewed by the Consultant.
- .11 Make cable pulls continuous and steady between pull points. Avoid interruptions to the pull unless necessitated by excessive tension on the cable.
- .12 Seal duct entrance into buildings with duct sealing compound to prevent the ingress of moisture, foreign materials and rodents.
- .13 Deem exposed any cable portion which is in a buried raceway and extends 1 m or more beyond the building curtain perimeter and provide over-voltage protection at each terminal.

### 3.6 **MANUFACTURER'S ATTENDANCE AND REPORT**

- .1 Provide manufacturer's representatives to verify installation practices for each part of the Work relevant to components including wiring and terminations.
- .2 Provide a construction review report prepared and signed by a representative of the manufacturer of wiring and terminations describing summary assessment for acceptability to meet warranty terms and conditions of work in progress for work described in this section and related sections affecting the Work. Submit a construction review report to accompany the first progress claim to include 50% of the Work by installed value. Submit second report on Substantial Completion of Work.
- .3 Manufacturer's report is an essential component of the Work and must be submitted to the Engineer before Consultant's Project deficiency review.

### 3.7 **FIELD INSPECTION**

- .1 Provide field technician for inspection and certification of cables, connectors, and associated equipment and accessories during installation, testing and commissioning as required. Provide a field technician possessing industry recognized credentials. Submit the technician's credentials as a Shop Drawing within five days of receiving a request from the Engineer or within five days of award of Contract, whichever is the sooner.

- .2 Acceptable credentials include certificates of qualifications issued or assessed by a registered telecommunications industry association, a registered college or university, a registered training institution, a registered labour union, or a certificate of installer training issued by the manufacturer of the Products in use for the Work.

1 General

1.1 **SUMMARY**

.1 Section Includes

- .1 Labour, Products, equipment and services necessary to complete the Work of this section.

1.2 **SYSTEM DESCRIPTION**

.1 General

- .1 Comply with TIA 606.
- .2 Use identification schema parameters identified on Contract Drawings.
- .3 Identification of cables, cabinets, electrical raceways, grounding conductors, communications outlets, faceplates, firestops, by use of printed alphanumeric labels and colour coding markers as further described on the Contract Drawings and herein.

.2 Standard Colours

- .1 Coloured marking using standardized colours consisting of the following Pantone reference colours or the indicated commercial equivalent:

.1 Red: Pantone 186C or 184C

- .1 Benjamin Moore: 133-20

- .2 Armourcoat: Fire Red 98-4748-6

.2 Blue: Pantone 300C or 291C

- .1 Benjamin Moore: 133-33

- .2 Armourcoat: Commodore Blue 98-4745-2

.3 White: Pantone White C

- .1 Benjamin Moore: 133-01

- .2 Armourcoat: Gloss White

.4 Orange: Pantone 166C or 150C

- .1 Benjamin Moore: 007

- .2 Armourcoat: Zesty orange

.5 Yellow: Pantone Yellow C or 101C

- .1 Benjamin Moore: 133-12

- .2 Armourcoat: Holland Yellow

.6 Green: Pantone 336 or 353C

- .1 Benjamin Moore: 133-40

- .2 Armourcoat: Shutter Green
- .7 Brown: Pantone 478C or 465C
  - .1 Benjamin Moore: 133-60
  - .2 Armourcoat: Havana Brown
- .8 Black: Pantone Black C
  - .1 Benjamin Moore: 133-80
  - .2 Armourcoat: Gloss Black
- .9 Purple: Pantone 257C or 264C
  - .1 Benjamin Moore: 1396
  - .2 Armourcoat: N/A
- .10 Grey: Pantone 422C
  - .1 Benjamin Moore: Not specified
  - .2 Armourcoat: Not specified

### 1.3 **SUBMITTALS**

- .1 Prepare a sample printed copy of the identification labels and submit to the Consultant for review.

## 2 **Products**

### 2.1 **MANUFACTURERS**

- .1 Furnish or install Products manufactured by stipulated manufactures where so indicated on the Contract Documents.

Avoid use of Products by manufacturers not stipulated on the Contract Documents.

Occurrence of Products in these Specifications other than those stipulated for use is not to be interpreted as authorization to use such Products.

### 2.2 **WRAP-AROUND COLOUR IDENTIFICATION MARKERS**

- .1 Coloured Metallic Cable Ties
  - .1 Coloured aluminum cables ties
    - .1 Width: 8 mm
    - .2 Lengths: 140 mm, 201 mm, 362 mm to suit cable or conduit diameters of 25 mm, 51 mm, 102 mm
    - .3 Colours: Blue, green, red, yellow, black, clear aluminum
  - .2 Listed manufacturers and representative Products:
    - .1 Panduit: MLT1H-LPAL, MLT2H-LPAL, MLT4H-LPAL etc
- .2 Coloured Hook and Loop Non-Metallic Cable Ties
  - .1 Coloured non-metallic cables ties, adjustable and reusable, hook-and-loop material, -18°C to +104°C

- .1 Widths: 8.4 mm, 13 mm, 19 mm
      - .2 Lengths: 150 mm, 300 mm, 457 mm
      - .3 Colours: Black, red, orange, yellow, green, blue, grey, white
    - .2 Listed manufacturers and representative Products:
      - .1 Panduit: HLT2I-X0 etc
    - .3 Electrical Colour Coding Tape
      - .1 PVC backing, 0.178 mm thick indoor outdoor suitable, pressure sensitive rubber adhesive, coloured, fade resistant, abrasion and weather resistant, to CSA C22.2 No 197-M1983
        - .1 Widths: 13 mm, 19 mm
        - .2 Colours: Black, brown, red, orange, yellow, green, blue, grey, white, violet
      - .2 Listed manufacturers and representative Products:
        - .1 Scotch 35 vinyl electrical colour coding tape
- 2.3 **LABELS**
- .1 General
    - .1 Comply with TIA-606A and CSA-T528.
    - .2 Prepare labels by use of machine printing.
    - .3 Avoid use of handwritten labels.
    - .4 Manufacturer: Same as original equipment Supplier, otherwise Panduit.
  - .2 Cable Labels
    - .1 Self-adhesive, self-laminating material, white engrave area.
    - .2 Minimum two times full wrap-around cable.
  - .3 Faceplate Labels
    - .1 Labels to suit selected faceplate.
  - .4 Grounding Bus Bars
    - .1 Self-adhesive, white engraved areas, minimum size 25 x 50 mm, characters minimum height 12 mm.
  - .5 Patch Panels
    - .1 Self-adhesive, white engraved areas to suit selected patch panel or termination strip.
  - .6 Rack and Cabinets
    - .1 Self-adhesive, white engraved areas, minimum size 50 x 75 mm, characters minimum height 12 mm.

2.4 **PAINT**

- .1 Comply with Section 09 91 00; otherwise treat as shop primed ferrous metal - alkyd finish.
  - .1 One coat alkyd, paint code 48, gloss enamel.
  - .2 Paint code: 48 - interior alkyd gloss enamel: Conforming to CAN/CGSB-1.60-M; Benjamin Moore 133, ICI Devoe 4308 Series, Para 400, PPG 6-282, Sherwin Williams B35-200 Series or Sico 888-111.

3 Execution

3.1 **COLOURS**

- .1 Use components in the colour as indicated.

3.2 **LABELLING**

- .1 General
  - .1 Identify conduits, electrical raceways, pullboxes, junction boxes, for communications according to the colour scheme indicated on the Contract Drawings and herein.
  - .2 Identify cables, outputs, faceplates, jacks, grounding components and cabinets for communications according to the labelling and identification scheme indicated in the Contract Drawings and herein.
  - .3 Use cables, jacks, cords, icons, manufactured in the colours identified in the Contract Drawings and herein.
  - .4 Use the identification scheme as indicated.
  - .5 Apply labels so that the printed information may be read without the need to disturb the cables.
  - .6 Apply labels on cables as close to the end of the cable jacket as practicable, and no closer than 10 mm and not concealed by obstructions.
  - .7 Apply labels on jacks, faceplates and patch panels in the manner prescribed by the original equipment manufacturer.
  - .8 Apply more than one label where immediate obstructions may prevent ease of reading the prescribed label.
  - .9 Apply a label on the inside of the electrical device outlet box corresponding to each cable terminated on the faceplate mounted on the device box.
  - .10 Use only approved cable marking materials.
  - .11 Clearly identify all outlets, patch-panels, patch-cords, cables, racks enclosures, spaces, closets, conduit, and raceways according to the administration system shown on the Contract Drawings.
  - .12 Use only machine printed labeling for outlets.
  - .13 Use only engraved plastic plates for the labeling of enclosures and racks.

.2 Horizontal Distribution Cabling

.1 Use the identification scheme as stipulated in the Contract Documents or herein.

.3 Backbone Cabling

.1 Use the identification scheme as stipulated in the Contract Documents or herein.

3.3 **LABELLING AND IDENTIFICATION SCHEMA**

.1 Schema H: Industrial

.1 General

.1 Schema applicable to large scale multiple level industrial premises.

.2 Horizontal distribution cables defined by alpha-numeric full definition of cabling termination hub, followed by cable family, followed by cable medium, followed by cable ordinal.

.3 Backbone cables defined by alpha-numeric full definition of cabling termination hub of source termination point, followed by destination termination point, followed by cable family, followed by cable medium, followed by cable ordinal.

.4 Prefix terms omitted where all cables share common term.

.5 Outlet defined.

.2 Scheme

.1 Comply with proxy values indicated on the Contract Drawings.

.2 Scheme consisting of the following terms

.1 Region identifier

.1 Example: Country

.2 Alpha: Two characters

.3 Proxy: RR

.2 Facility identifier

.1 Example: City

.2 Alpha: Two characters

.3 Proxy: CC

.3 Premises / area / building identifier

.1 Example: Production plant

.2 Alpha-numeric: Two characters

.3 Proxy: AA

.4 Floor / level identifier

.1 Indicates floor of cabling hub

- .2 Example: Mezzanine
  - .3 Alpha-numeric: Two characters
  - .4 Proxy: FF
- .5 Cabling hub identifier
  - .1 Example: Telecom enclosure
  - .2 Alpha-numeric: One to six characters
  - .3 Proxy: hhhhhH
- .6 Cable family
  - .1 Example: Production network
  - .2 Alpha: One character
  - .3 Proxy: G
- .7 Medium type
  - .1 Example: Optical fibre
  - .2 Alpha: One character
  - .3 Proxy: M
- .8 Cable ordinal
  - .1 Example: Numeric value
  - .2 Numeric: Four character, zero filled, right justified
  - .3 Proxy: NNNN
- .3 Horizontal distribution format
  - .1 Fully defined form
    - .1 RR-CC-AA-FF-hhhhhH-G-M-NNNN
  - .2 Abbreviated form for cables within a sole region
    - .1 CC-AA-FF-hhhhhH-G-M-NNNN
  - .3 Abbreviated form for cables within a sole facility
    - .1 AA-FF-hhhhhH-G-M-NNNN
  - .4 Abbreviated form for cables within a sole premises
    - .1 FF-hhhhhH-G-M-NNNN
  - .5 Abbreviated form for cables within a sole premises and within a sole family
    - .1 FF-hhhhhH-M-NNNN
  - .6 Abbreviated form for cables within a sole premises and within a sole family and of a single medium

- .1 FF-hhhhhH-NNNN
- .4 Horizontal distribution format examples:
  - .1 Administration network copper Category 6 distribution cables on grade level terminating at communications enclosure at grid reference WA/11
    - .1 01-WA/11-A-C-0001.....01-WA/11-A-C-9999
  - .2 Production network copper Category 6 distribution cables on grade level terminating at communications enclosure at grid reference WA/11
    - .1 01-WA/11-P-C-0001....01-WA/11-P-C-9999
  - .3 Production network multimode optical fibre distribution cables on grade level terminating at communications enclosure at grid reference WA/11
    - .1 01-WA/11-P-M-0001....01-WA/11-P-M-9999
  - .4 Administration network copper Category 6 distribution cables on 2<sup>nd</sup> floor terminating at communications enclosure in telecom room 201.
    - .1 02-201-A-C-0001.....02-201-A-C-9999
- .5 Back bone format
  - .1 Fully defined form
    - .1 RR-CC-AA-FF-hhhhhH-AA-FF-hhhhhH-G-M-NNNN
  - .2 Abbreviated form for cables within a sole region
    - .1 CC-AA-FF-hhhhhH-AA-FF-hhhhhH-G-M-NNNN
  - .3 Abbreviated form for cables within a sole facility
    - .1 AA-FF-hhhhhH-AA-FF-hhhhhH-G-M-NNNN
  - .4 Abbreviated form for cables within a sole premises
    - .1 FF-hhhhhH-FF-hhhhhH-G-M-NNNN
- .6 Backbone cabling format examples
  - .1 Administrative network copper multi-pair Category 6 backbone cables originating at second floor main telecom room #201, terminating at equipment enclosure WA/11 on grade level
    - .1 02-201-01-WA/11-A-C-0001
  - .2 Production network single mode optical fibre multi strand originating at second floor main telecom room #201, terminating at equipment enclosure WA/11 on grade level
    - .1 02-201-01-WA/11-P-S-0001

- .3 Production network single mode optical fibre multi strand originating at grade level equipment enclosure WP/15, terminating at equipment enclosure WA/11 on grade level
      - .1 01-WP/15-01-WA/11-P-S-0001
  - .7 Outlet numbering format
    - .1 Fully defined form
      - .1 RR-CC-AA-FF-hhhhhH-G-M-NNNN
    - .2 Typical usage
      - .1 hhhhhhH-G-M-NNNN
  - .8 Outlet numbering format examples
    - .1 Administration network copper Category 6 distribution cables on grade level terminating at communications enclosure at grid reference WA/11
      - .1 WA/11-A-C-0001
    - .2 Administration network copper Category 6 distribution cables on 2<sup>nd</sup> floor terminating at communications enclosure in telecom room 201.
      - .1 201-A-C-0001
- .2 Scheme A: Consecutive Numbering – Single Data Outlet
- .1 General
    - .1 Use this scheme where an outlet is indicated on the Contract Drawings as data.
  - .2 Identifier Scheme
    - .1 Scheme template: DxxxTyyy where
      - .1 D (fixed, literal) indicates DATA cable
      - .2 XXX (variable, ordinal) indicates building floor of outlet
      - .3 T (variable) indicates the telecommunication room in which the cable is terminated
      - .4 YYY (variable, ordinal) indicates cable count ordinal
      - .5 Use full scheme for labels affixed to cables and jacks. Do not abbreviate.
  - .3 Floor Ordinal
    - .1 Use the numeric value of the floor on which the work area outlet is situated, padded left to three characters using zero as the pad character. Use numbers for floors above grade, prefix floors below grade with B or character to suit local conditions, use M to indicate mezzanine levels. In North America avoid the value “000”.

- .2 Example:
  - .1 Floor 12: 012
  - .2 Basement 3: 0B3
  - .3 Concourse 2: 0C2
  - .4 Mezzanine 2: 0M2
  - .5 Ground floor: 001
- .4 Termination Identifier
  - .1 Use a sequential alphabetic identification character to indicate in which telecommunications room the cable is terminated: Match to existing convention such as N (North), S (South) otherwise use A, B, C etc.
- .5 Telecommunications Room Horizontal Cable Patch Panel Termination
  - .1 Select the lowest numeric value as the starting value in an ordinal series to avoid duplication of identification with existing cabling, padded left to three characters using zero and the pad character.
  - .2 Label the data termination field beginning at the upper most and left most jack position, starting with the lowest ordinal, advancing horizontally left to right, and progressing vertically as each row of jacks is completed. Example 001, 002, etc.
  - .3 Label the cable at the patch panel with the same identification as the jack to which the cable is connected.
- .6 Cable Count Ordinals
  - .1 Select the lowest numeric value as the starting value in an ordinal series to avoid duplication of identification with existing cabling, padded left to three characters using zero and the pad character.
  - .2 Example: Cable 32: 032.
- .7 Work Area Outlet
  - .1 Label the jacks at the work area outlet faceplate with the same identification as the cable connecting to the jack.
  - .2 Install voice and data jacks with the same numeric ordinal on a common faceplate where local conditions permit.
- .3 Scheme B: Basic Numbering
  - .1 General
    - .1 Where an outlet is indicated on the Contract Drawings designate each jack as a communications jack suitable for data or voice or other services, with the following exceptions.
      - .1 Where an outlet is tagged on the Contract Drawings as "T", designate the jack for convenience telephone service.
      - .2 Where an outlet is tagged on the Contract Drawings as "P" designate the cable for payphone service.

- .3 Where an outlet is tagged on the Contract Drawings as “M”, designate the cable for monitored line service.
  - .4 Where an outlet is tagged on the Contract Drawing as “I”, designate the cables for intercom service.
  - .5 Where an outlet is tagged on the Contract Drawing as “C”, designate the cables for special communications service.
- .2 Facility Prefix
- .1 Prefix all identifies with a building identifier. Default this field to blank if there is only one building.
  - .2 Prefix all identifiers with a numeric value indicating the floor within the premises or facility for the telecommunications room where the cable is terminated.
    - .1 Example: Floor 2: 02; basement: B1; ground floor: 01
  - .3 Follow the prefix with a hyphen separator and an alpha character and a hyphen separator to identify the specific telecommunications room where there is more than one to any floor.
  - .4 Reserve the special value of “Z” to indicate a building entrance service room.
    - .1 Example: First and only telecom room: -A-; second telecom room on common floor: -B-; building entrance room: -Z-
- .3 Numeric Ordinals
- .1 Select the lowest numeric value as the starting value in an ordinal series to avoid duplication of identification with new or existing cabling.
- .4 Communications Cables
- .1 Identify cables as nnn where nnn is a unique numeric ordinal beginning at 001 to 999.
    - .1 Example: Cable #1: 001; cable #50: 050
- .5 Telephone Cables
- .1 Identify telephone cables as Tnnn where nnn is a unique numeric ordinal beginning at 001 to 999 and T is a literal value.
    - .1 Example: Telephone cable #1: T001; telephone cable #50: T050
- .6 Pay Phone Cables
- .1 Identify payphone cables as Pnnn where nnn is a unique numeric ordinal beginning at 001 to 999 and P is a literal value.
    - .1 Example: Pay phone cable #1: P001; pay phone cable #2: P002
- .7 Monitored Line Cables
- .1 Identify monitored line cables as Mnnn where nnn is a unique numeric ordinal beginning at 001 to 999 and M is a literal value.

- .1 Example: Monitored line cable #1: M001; monitored line cable #2: M002
- .8 Intercom Cables
  - .1 Identify intercom line cables as Innn where nnn is a unique numeric ordinal beginning at 001 to 999 and I is a literal value.
    - .1 Example: Intercom line cable #1: I001; intercom line cable #2: I002
- .9 Work Area Outlet
  - .1 Label the jacks at the work area outlet faceplate with the same identification as the cable connecting to the jack.
- .10 Telecommunications Room Horizontal Cable Patch Panel Termination
  - .1 Label the jacks at the patch panel with the same identification as the cable connecting to the jack.
  - .2 Label the communications cable termination field beginning at the upper most and left most jack position, starting with the lowest ordinal, advancing horizontally, left to right, and progressing vertically as each row of jacks is completed. Example: 001, 002, 003, etc.
    - .1 For each non-generic cable, label the termination field beginning at the upper most and left most jack position, starting with the lowest ordinal, beginning a new row for each non-generic type.
    - .2 Example  
P001, P002, P003, P004 ....  
T001, T002, T003, T004, ....  
M001, M002, M003, M004, ....  
C001, C002, C003, C004, ....
- .11 Cable Identification Examples
  - .1 A-01-A-001: Building A, floor 01, room A, cable 001
  - .2 A-B1-Z-P001: Building A, basement B1, room Z (entrance room), pay phone 001
- .4 Scheme M: Modular Numbering
  - .1 General
    - .1 Where an outlet is tagged on the Contract Drawings as "V/2D", designate one jack as voice, the other two jacks as data.
    - .2 Where an outlet is tagged on the Contract Drawings as "V/D", designate one jack as voice, the other jack as data.
    - .3 Where an outlet is tagged on the Contract Drawings as "T" or "T1", designate the jack for convenience telephone service.
    - .4 Where an outlet is tagged on the Contract Drawings as "P" or "P1", designate the cable for payphone service.

- .5 Where an outlet is tagged on the Contract Drawings as “M”, designate the cable for monitored line service.
- .6 Where an outlet is tagged on the Contract Drawing as “I” or “I1”, designate the cables for intercom service.
- .2 Facility Prefix
  - .1 Prefix all identifiers with a numeric value indicating the floor within the premises or facility for the telecommunications room in which the cable is terminated.
  - .2 Follow the prefix with an alpha character to identify the specific telecommunications room where there is more than one to any floor.
  - .3 Separate the prefix from the alphanumeric identifier with a hyphen separator.
- .3 Numeric Ordinals
  - .1 Select the lowest numeric value as the starting value in an ordinal series to avoid duplication of identification with existing cabling.
- .4 Voice Cables
  - .1 Identify voice cables as V-rr-pp-jj where
    - .1 “rr” is a unique two character numeric ordinal identifying the rack on which the cable is terminated beginning at 01.
    - .2 “pp” is a consecutive two character numeric ordinal, unique in any rack or cabinet, identifying the patch-panel on which the cable is terminated, commencing at 01 at the uppermost patch panel in the rack.
    - .3 “jj” is a consecutive two character numeric ordinal, unique in any one patch panel, identifying the jack on which the cable is terminated, commencing at 01 at the uppermost, left most jack position in the panel.
    - .4 “V” is a literal value.
- .5 Data Cables
  - .1 Identify data cables as D-rr-pp-jj where
    - .1 “rr” is a unique two character numeric ordinal identifying the rack on which the cable is terminated beginning at 01.
    - .2 “pp” is a consecutive two character numeric ordinal, unique in any rack or cabinet, identifying the patch-panel on which the cable is terminated, commencing at 01 at the uppermost patch panel in the rack.
    - .3 “jj” is a consecutive two character numeric ordinal, unique in any one patch panel, identifying the jack on which the cable is terminated, commencing at 01 at the uppermost, left most jack position in the panel.
    - .4 D is a literal value.

.6 Telephone Cables

.1 Identify telephone cables as T-rr-pp-jj where

- .1 "rr" is a unique two character numeric ordinal identifying the rack on which the cable is terminated beginning at 01.
- .2 "pp" is a consecutive two character numeric ordinal, unique in any rack or cabinet, identifying the patch-panel on which the cable is terminated, commencing at 01 at the uppermost patch panel in the rack.
- .3 "jj" is a consecutive two character numeric ordinal, unique in any one patch panel, identifying the jack on which the cable is terminated, commencing at 01 at the uppermost, left most jack position in the panel.
- .4 T is a literal value.

.7 Pay Phone Cables

- .1 Identify payphone cables as Pnnn where nnn is a unique numeric ordinal not occurring in the existing Pay phone cabling beginning at 001 to 999 and P is a literal value.

.8 Monitored Line Cables

- .1 Identify monitored line cables as Mnnn where nnn is a unique numeric ordinal not occurring in the existing monitored line cabling beginning at 001 to 999 and M is a literal value.

.9 Intercom Cables

- .1 Identify intercom line cables as Innn where nnn is a unique numeric ordinal not occurring in the existing intercom cabling beginning at 001 to 999 and I is a literal value.

.10 Work Area Outlet

- .1 Label the jacks at the work area outlet faceplate with the same identification as the cable connecting to the jack.

.11 Telecommunications Room Horizontal Cable Patch Panel Termination

- .1 Label the jacks at the patch panel with the same identification as the cable connecting to the jack.
- .2 Label the voice termination field beginning at the upper most and left most jack position, starting with the lowest ordinal, advancing horizontally, left to right, and progressing vertically as each row of jacks is completed. Example: V001, V002, V003, etc.
- .3 Label the data termination field beginning at the upper most and left most jack position, starting with the lowest ordinal, advancing horizontally in A and B pairs, left to right, and progressing vertically as each row of jacks is completed. Example D001A, D001B, D002A, D002B, etc.

.5 Scheme C: Consecutive Numbering

.1 General

- .1 Where an outlet is tagged on the Contract Drawings as "V/2D", designate one jack as voice, the other two jacks as data A and data B respectively.
- .2 Where an outlet is tagged on the Contract Drawings as "V/D", designate one jack as voice, the other jacks as data A.
- .3 Where an outlet is tagged on the Contract Drawings as "T" or "T1", designate the jack for convenience telephone service.
- .4 Where an outlet is tagged on the Contract Drawings as "P" or "P1", designate the cable for payphone service.
- .5 Where an outlet is tagged on the Contract Drawings as "M", designate the cable for monitored line service.
- .6 Where an outlet is tagged on the Contract Drawing as "I" or "I1", designate the cables for intercom service.
- .2 Facility Prefix
  - .1 Prefix all identifiers with a numeric value indicating the floor within the premises or facility for the telecommunications room where the cable is terminated.
  - .2 Follow the prefix with an alpha character to identify the specific telecommunications room where there is more than one to any floor.
  - .3 Separate the prefix from the alphanumeric identifier with a hyphen separator.
- .3 Numeric Ordinals
  - .1 Select the lowest numeric value as the starting value in an ordinal series to avoid duplication of identification with existing cabling.
- .4 Voice Cables
  - .1 Identify voice cables as Vnnn where nnn is a unique numeric ordinal beginning at 001 to 999 and V is a literal value.
- .5 Data Cables
  - .1 Identify one data cable to an outlet as DnnnA where nnn is a unique numeric ordinal beginning at 001 to 999 and D and A are literal values.
  - .2 Identify the second data cable to an outlet as DnnnB where nnn is a unique numeric ordinal beginning at 001 to 999 and D and B are literal values.
- .6 Telephone Cables
  - .1 Identify telephone cables as Tnnn where nnn is a unique numeric ordinal beginning at 001 to 999 and T is a literal value.
- .7 Pay Phone Cables
  - .1 Identify payphone cables as Pnnn where nnn is a unique numeric ordinal beginning at 001 to 999 and P is a literal value.
- .8 Monitored Line Cables

- .1 Identify monitored line cables as Mnnn where nnn is a unique numeric ordinal beginning at 001 to 999 and M is a literal value.
- .9 Intercom Cables
  - .1 Identify intercom line cables as Innn where nnn is a unique numeric ordinal beginning at 001 to 999 and I is a literal value.
- .10 Work Area Outlet
  - .1 Label the jacks at the work area outlet faceplate with the same identification as the cable connecting to the jack.
  - .2 Install voice and data jacks with the same numeric ordinal on a common faceplate.
- .11 Telecommunications Room Horizontal Cable Patch Panel Termination
  - .1 Label the jacks at the patch panel with the same identification as the cable connecting to the jack.
  - .2 Label the voice termination field beginning at the upper most and left most jack position, starting with the lowest ordinal, advancing horizontally, left to right, and progressing vertically as each row of jacks is completed. Example: V001, V002, V003, etc.
  - .3 Label the data termination field beginning at the upper most and left most jack position, starting with the lowest ordinal, advancing horizontally in A and B pairs, left to right, and progressing vertically as each row of jacks is completed. Example D001A, D001B, D002A, D002B, etc.
- .6 Scheme D: Ottawa City
  - .1 General
    - .1 Where an outlet is tagged on the Contract Drawings as "VV/DD", the outlet is served by two cables; cable A dedicated to a data jack, designated as DATA 1; cable B split between three jacks, designated as VOICE 1, VOICE 2, DATA 2.
    - .2 Where an outlet is tagged on the Contract Drawings as "T", the outlet is served by one cable and is for convenience telephone service.
    - .3 Where an outlet is tagged on the Contract Drawings as "P", the outlet is served by one cable and is for payphone service.
    - .4 Where an outlet is tagged on the Contract Drawings as "M", the outlet is served by one cable and is for monitored line service.
    - .5 Where an outlet is tagged on the Contract Drawing as "I", the outlet is served by one cable and is for intercom service.
  - .2 Jack Colours
    - .1 Jack colours and position in faceplate:
      - .1 Data 1 colour: Grey: Position - lower left
      - .2 Voice 1 colour: Blue: Position - upper left
      - .3 Voice 2 colour: Beige: Position - upper right

- .4 Data 2 colour: Orange: Position - lower right
- .3 Facility Prefix
  - .1 Maintain records in an electronic data file. Prefix all alpha-numeric identifiers with an alpha-numeric character string indicating the site reference.
  - .2 For city of Ottawa sites, use the following site identifiers:
    - .1 Dispatch building: D
    - .2 Garage: G
    - .3 Bylaw building: B
- .4 Termination Room Identifiers
  - .1 Use a room identifier to identify the telecommunications rooms as follows:
    - .1 "1": Telecom room, dispatch building, 2<sup>nd</sup> floor
    - .2 "2": Telecom and equipment room, garage
    - .3 "3": Telecom enclosure, office mezzanine
    - .4 "4": Telecom room, garage, tire bay
    - .5 "5": Telecom room, garage entrance
    - .6 "6": Telecom enclosure, garage mezzanine
    - .7 "9": Telecom room, bylaw building
- .5 Distribution Cable Identifications
  - .1 Label each end of every distribution cable. Label each cable with a unique identifier. Use the same identifier at each end of each respective cable.
  - .2 Use a cable identifier to identify the various distribution cable purposes as follows:
    - .1 Data jack (D1): Cable type A
    - .2 Hybrid (V1 V2 D2): Cable type B
    - .3 Voice only (V): Cable type V
    - .4 Wireless access: Cable type W
    - .5 Express POTS: Cable type P
    - .6 Building ECMS: Cable type E
  - .3 Identify the cables comprising the pair of cables to a MIXED USE outlet as follows, where "b" is facility prefix: "n" is terminating room identifier, "xxx" is the cable ordinal, and "A" or "B" to identify the respective cables. Use the same cable ordinal for the two cables terminating at a common outlet.

- .1 Cable to data 1: b-n-A-xxx
  - .2 Cable to voice 1, voice 2, data 2: b-n-B-xxx
- .4 Identify the cable to a single use outlet as follows, where “b” is facility prefix: “n” is terminating room identifier, “xxx” is the cable ordinal, and “C” or “D” or “E” or “F” to identify the respective cables.
  - .1 Cable to voice: b-n-V-xxx
  - .2 Cable Wireless Access Point (WAP): b-n-W-xxx
  - .3 Cable to POTS outlet: b-n-P-xxx
  - .4 Cable to building EMCS: b-n-E-xxx
- .6 Numeric Ordinals
  - .1 Select the lowest numeric value as the starting value in an ordinal series to avoid duplication of identification with existing cabling.
  - .2 Two cables terminating at a common faceplate to carry the same ordinal.
  - .3 Cable ordinals for all cables types to begin at 001, restarting at 001 for each cable type at each telecom room.
- .7 Telephone Cables
  - .1 Treat telephone cables as single purpose voice cables (above).
- .8 Payphone Cables
  - .1 Treat pay telephone cables as single purpose (POTS) cables (above).
- .9 Monitored Line Cables
  - .1 Treat power utility monitoring cables as single purpose (POTS) cables (above).
- .10 Intercom Cables
  - .1 Not specified
- .11 Work Area Outlet
  - .1 Label single use and mixed use outlets according to the respective schemes described below.
  - .2 Label the faceplate at a mixed use outlet as follows where “b” is facility prefix, “n” is terminating room identifier, “xxx” is the cable ordinal of the two cables terminating at the outlet
    - .1 b-n-xxx
  - .3 Label the jacks at the MIXED USE work area outlet faceplate
    - .1 Upper left: Voice 1
    - .2 Upper right: Voice 2
    - .3 Lower left: Data 1

- .4 Lower right: Data 2
- .4 Install voice (V1, V2) and data (D1, D2) jacks with the same numeric ordinal on a common faceplate.
- .5 Label the faceplate at a single use outlet as follows where "b" is facility prefix, "n" is terminating room identifier, "X" is replaced with "V" or "W" or "P" or "E" to identify the respective cables type and "xxx" is the cable ordinal of the cable terminating at the outlet.
  - .1 b-n-X-xxx
- .12 Telecommunications Room Horizontal Cable Patch Panel Termination
  - .1 Label each patch panel with facility prefix and room identifier as indicated above, where "b" is facility prefix, "n" is terminating room identifier
    - .1 b-n
  - .2 Label the jacks at the patch panel with the same identification as the cable connecting to the jack
    - .1 Jack connected to Cable A: A-xxx
- .13 Telecommunications Room Horizontal Cable Wall Mounted Panel Termination
  - .1 Label each wall mounted panel with facility prefix and room identifier as indicated above, where "b" is facility prefix, "n" is terminating room identifier
    - .1 b-n
  - .2 Label the terminations at the termination panel with the same identification as the cable connecting to the termination
    - .1 Termination for Cable B: B-xxx
    - .2 Termination for Cable V: V-xxx
    - .3 Termination for Cable W: W-xxx
    - .4 Termination for Cable P: P-xxx
    - .5 Termination for Cable E: E-xxx
  - .3 Label terminations beginning at the upper most and left most position, starting with the lowest ordinal, advancing horizontally, left to right, and progressing vertically as each row of jacks is completed. Example: B-001, B-002, B-003, etc.
  - .4 Terminate cables of only a single type on a termination block.
- .7 Scheme E
  - .1 Generic Horizontal Cabling
    - .1 Use this scheme for converged horizontal systems with separate CCTV.
    - .2 Identifier scheme template: ITx-nnn or ITx-Cppp
      - .1 IT: Literal to indicate IT room or enclosure.

- .2 X: Ordinal from 0 through 6 to indicate different communication wiring hubs as shown on the layout drawings.
- .3 Nnn: Consecutive cable ordinals to identify each cable with a unique identifier. Series resets to 001 at each IT room or enclosure.
- .4 C: Identifier to distinguish cables for CCTV camera connections.
- .5 Ppp: Three digit identifier to uniquely distinguish each camera. Same ordinal used to identify cable to the camera.
- .3 Telecommunications Room Horizontal Cable Patch Panel Termination
  - .1 Label the data termination field beginning at the upper most and left most jack position, starting with the lowest ordinal, advancing horizontally left to right, and progressing vertically as each row of jacks is completed.
  - .2 Repeat for CCTV. Segregate CCTV cables from other cables.
  - .3 Label the cable at the patch panel with the same identification as the jack to which the cable is connected.
- .4 Cable Count Ordinals
  - .1 Select the lowest numeric value as the starting value in an ordinal series to avoid duplication of identification with existing cabling, padded left to three characters using zero and the pad character.
- .5 Work Area Outlet
  - .1 Label the jacks at the work area outlet faceplate with the same identification as the cable connecting to the jack.
- .2 Presto horizontal cabling
  - .1 Use this scheme for cables specific to Presto systems
  - .2 Identifier scheme template:
    - .1 Label each cable as indicated on the riser diagram and layout drawings.
    - .2 Cable identification strings:  
SPAAC  
TPT-P  
DRD-P  
SPOS-P  
DSC-P  
SPOS-T1 through SPOS-T2  
WP-1 through WP-9
    - .3 Cabinet identification strings:  
CC-P1 through CC-P3  
DC-P  
CC-T

- .4 Telecommunications room horizontal cable patch panel termination.
      - .5 Label the data termination field beginning at the upper most and left most jack position.
      - .6 Label the cable at the patch panel with the same identification as the jack to which the cable is connected.
    - .3 Work Area Outlet
      - .1 Label the jacks at the work area outlet faceplate with the same identification as the cable connecting to the jack.
- .8 Scheme U: Unified Numbering – Single Outlet
  - .1 General
    - .1 Use this scheme where an outlet is indicated on the Contract Drawings as data, or IP phone, or POTS, or red phone.
  - .2 Identifier Scheme
    - .1 Scheme template: DxxxTTTTTcccYYY where
      - .1 D (literal) indicates DATA cable; P (literal) indicates POTS telephone.
      - .2 XXX (variable, ordinal) indicates building floor of outlet.
      - .3 TTTTT (variable) indicates the telecommunication room in which the cable is terminated.
      - .4 Ccc (variable, ordinal) indicates cabinet/panel identification.
      - .5 YYY (variable, ordinal) indicates cable count ordinal.
      - .6 Use full scheme for labels affixed to cables and jacks. Do not abbreviate.
  - .3 Floor Ordinal
    - .1 Use the numeric value of the floor on which the Work area outlet is situated, padded left to three characters using zero as the pad character. Use numbers for floors above grade, prefix floors below grade with B or character to suit local conditions, use M to indicate mezzanine levels. In North America avoid the value “000”.
    - .2 Example:
      - .1 Floor main at grade: 001
      - .2 Floor 2 above grade: 002
      - .3 Mechanical mezzanine: BM1
      - .4 Mechanical main: B01
      - .5 Transformer level: B02
      - .6 Cabling level: B03

- .4 Termination Identifier
  - .1 Use a sequential alphanumeric identification to indicate which telecommunications room the cable is terminated: Use full room number.
  - .2 Example:
- .5 Telecommunications Cabinet/Panel
  - .1 Use a sequential alphanumeric identification to indicate which telecommunications cabinet/panel the cable is terminated.
  - .2 Example
- .6 Telecommunications Room Horizontal Cable Patch Panel Termination
  - .1 Select the lowest numeric value as the starting value in an ordinal series to avoid duplication of identification with existing cabling, padded left to three characters using zero and the pad character.
  - .2 Label the data termination field beginning at the upper most and left most jack position, starting with the lowest ordinal, advancing horizontally left to right, and progressing vertically as each row of jacks is completed.
  - .3 Example 001, 002, etc.
  - .4 Label the cable at the patch panel with the same identification as the jack to which the cable is connected.
- .7 Cable Count Ordinals
  - .1 Select the lowest numeric value as the starting value in an ordinal series to avoid duplication of identification with existing cabling, padded left to three characters using zero and the pad character.
  - .2 Example: Cable 32: 032.
- .8 Work Area Outlet
  - .1 Label the jacks at the Work area outlet faceplate with the same identification as the cable connecting to the jack.
- .9 Backbone Cabling
  - .1 General Scheme
    - .1 Designate backbone multi-pair copper cables as MC//01//02//nnn, where 01 designates the terminal in or nearest to the building entrance room, 02 designates the next telecommunications room and nnn is a unique numeric ordinal beginning at 001 to 999. The ordinal is maintained unique throughout this cable type; it does not revert to 001.
      - .1 Example  
MC/A-B1-Z/A-01-A/001  
Multi-pair copper cable, from: building A, basement B1, entrance room (Z); to building A, floor 01, room A; cable number 001
    - .2 Designate backbone optical fibre multimode cable as OM-01-02-nnn where 01 designates the terminal in or nearest to the building entrance room, 02 designates the next telecommunications room and nnn is a

unique numeric ordinal beginning at 001 to 999. The ordinal is maintained unique throughout this cable type; it does not revert to 001.

- .3 Designate backbone optical fibre single mode cable as OS-01-02-nnn where 01 designates the terminal in or nearest to the building entrance room, 02 designates the next telecommunications room and nnn is a unique numeric ordinal beginning at 001 to 999. The ordinal is maintained unique throughout this cable type; it does not revert to 001.
- .4 Designate backbone crossover copper 4-pair cable as Xnnn where nnn is a unique numeric ordinal beginning at 001 to 999 and X is a literal value. The ordinal is maintained unique throughout this cable type; it does not revert to 001.

.2 Multi-Pair Copper Backbone Cables

- .1 Label the termination field with the identification of the cable that terminates thereon.

.3 Optical Fibre Backbone Cables

- .1 Label the optical fibre termination patch field with the identification of the cable that terminates thereon.

.4 Backbone Crossover Cables

- .1 Label the crossover termination field beginning at the upper most and left most jack position, starting with the lowest ordinal, advancing horizontally, left to right, and progressing vertically as each row of jacks is completed. Example: X001, X002, X003, etc.

.5 Scheme D: Ottawa City

- .1 Use “facility prefix” and “termination room identifiers” as indicated above for horizontal distribution cabling.
- .2 Identify backbone cables as lying between the far-end facility and near-end facility where the near-end is closest to the work area.
- .3 Label each end of every backbone cable. Label each cable with a unique identifier. Use the same identifier at each end of each respective cable.
- .4 Label each cable within each pull box or maintenance hole.
- .5 Identify each cable indicating the media type, shown below as “MMM”, as follows:
  - .1 Optical fibre: Multi mode: OM1
  - .2 Optical fibre: Multi mode: OM2
  - .3 Optical fibre: Multi mode: OM3
  - .4 Optical fibre: Single mode: OS1
  - .5 Copper unshielded: Cat 1: UT1
  - .6 Copper unshielded: Cat 3: UT3
  - .7 Copper unshielded: Cat 5e: UT5

- .8 Copper shielded: Cat 1: ST1
- .9 Copper shielded: Cat 3: ST3
- .10 Copper shielded: Cat 5e: ST5
- .11 Copper armoured: Cat 1: AT1
- .12 Copper armoured: Cat 1: AT3
- .13 Copper armoured: Cat 5e: AT5
- .6 Multi-pair backbone copper cables
  - .1 Label the termination field with the identification of the cable that terminates thereon.
  - .2 Identify each cable as follows, where “F” facility prefix for far-end facility, “f” is terminating room identifier at the far end, “N” is the facility prefix for the near end, “n” is the termination room identifier at the near end, “MMM” indicates the media type, indicates “ppp” indicates the number of pairs, left padded with zero, “xxx” is the cable ordinal, left padded with zero
    - .1 F-f -N-n-MMM-ppp-xxx
- .7 Multi-strand optical fibre cables
  - .1 Label the optical fibre termination patch field with the identification of the cable that terminates thereon.
  - .2 Identify each cable as follows, where “F” facility prefix for far-end facility, “f” is terminating room identifier at the far end, “N” is the facility prefix for the near end, “n” is the termination room identifier at the near end, “MMM” indicates the media type, indicates “ppp” indicates the number of strands, left padded with zero, “xxx” is the cable ordinal, left padded with zero
    - .1 F-f -N-n-MMM-ppp-xxx
- .8 Backbone ordinals
  - .1 Number all copper cables with a common far-end identifier using unique consecutive ordinals beginning at 001.
  - .2 Number all optical fibre cables with a common far-end identifier using unique consecutive ordinals beginning at 001.
- .6 Scheme E:
  - .1 Generic backbone cabling
    - .1 Identifier scheme template: ITx-ITy-M-nnn
      - .1 IT: Literal to indicate IT room or enclosure.
      - .2 X: Ordinal from zero through six to indicate different communication wiring hubs as shown on the layout drawings. (x) is always numerically less than (y).

- .3 M: Identification of medium:  
O to indicate optical fibre,  
C to indicate copper
        - .4 Nnn: Consecutive cable ordinals to identify each cable with a unique identifier.
      - .2 Presto optical fibre backbone cabling
        - .1 Identifier scheme template: DCP-Px-M-nnn
          - .1 DCP: Literal to indicate main Presto panel
          - .2 P: Literal to indicate Presto panel
          - .3 X: Ordinal from one through three to indicate different Presto panels
          - .4 M: Identification of medium:  
O to indicate optical fibre,  
C to indicate copper
          - .5 Nnn: Consecutive cable ordinals to identify each cable with a unique identifier.
- .10 Connecting Cords
  - .1 Do not label connecting cords.
  - .2 Identify each connecting cord with a label affixed at each end within 50 mm of the jack
    - .1 Label each cable as follows where "LL" is length expressed in meters, left padded with zero, "xxx" is cord ordinal, left padded with zero, beginning at 001. Ordinal does not reset for different values of LL
      - .1 LL-xxx

### 3.4 COMMUNICATIONS PATHWAY IDENTIFICATION

- .1 General
  - .1 Identify only those communications conduits used for backbone cabling.
  - .2 Identify communications ducts.
- .2 Mark surface mounted metallic or non-metallic conduit raceways by use of combination of coloured couplers and painted stripes, electrical identification plastic tape, or wrap-around markers.
- .3 Do not identify surface raceways mounted below ceiling line in finished areas. Do not apply colour code identifier markings to outlet faceplates.
- .4 Identify raceways at termination of raceway and transition to other raceways or enclosures. Apply markings on each side of transit through architectural partitions or floors or ceilings.
- .5 Employ system colours as indicated in table below.
- .6 Apply a small area of paint to inside of outlet, junction and pull boxes.

- .7 Apply identifying mark as paint to full surface of junction box and pull box cover panels for boxes of 150 mm x 150 mm or smaller.
- .8 Apply identifying mark as stripe for junction and pull boxes greater than 150 mm x 150 mm.
- .9 Use wrap around identification bands to identify conduit where painting is impracticable or prohibited or has potential to damage cabling or adjacent materials. Avoid obscuring labels. Avoid obscuring inspection windows.
- .10 Use wraparound identification bands to identify exposed communications cabling according to system where indicated on the Drawings.
- .11 Apply one or more markings per the table below as indicated in the Contract Drawings. Refer also to Section 25 05 54. Where the Specifications differ, Section 25 05 54 will prevail.
- .12 Apply a base mark of minimum 19 mm wide. Where indicated, apply stripes of minimum 8 mm maximum 12 mm each. Apply marking with separation of 12 mm to 20 mm between adjacent bands. Apply the base marking band nearest to the junction of the conduit with the junction box, outlet box or pull box.

- .13 Use the following system colours

System	base colour	1 <sup>st</sup> stripe	2 <sup>nd</sup> stripe
Communications	blue		
Communications – backbone	blue	blue	
Communications – backbone – copper (public)	blue	blue	green
Communications – backbone – copper (private)	blue	blue	blue
Communications – backbone – fibre (public)	blue	blue	orange
Communications – backbone – fibre (private)	blue	blue	yellow
Communications – distribution	blue	green	
Communications – distribution – copper	blue	green	green
Communications – distribution – fibre	blue	green	orange
Security	green		
Security – access control	green	yellow	
Security – intrusion detection	green	yellow	green
Security – CCTV	green	blue	
Security – magnetic locks	green	red	
Security – duress alarms	green	red	green
Fire alarm	red		
Fire alarm – speakers	red	white	
Fire alarm – telephone	red	blue	

Distributed communications	white		
Distributed communications – intercom	white	brown	
Distributed communications – PA	white	white	
Distributed communications – AV	white	white	green
Distributed communications – radio	white	green	
Distributed communications – CATV	white	blue	
End of Section			

1 General

1.1 **SUMMARY**

.1 Section Includes

- .1 Labour, Products, equipment and services necessary to complete the Work of this section.

1.2 **REFERENCES**

- .1 Telecommunications Industry Association ([www.tiaonline.org](http://www.tiaonline.org))  
.2 Building Industry Consulting Services International (BICSI) ([www.bicsi.com](http://www.bicsi.com))  
.3 International Electrical Testing Association Inc. ([www.netaworld.org](http://www.netaworld.org))

1.3 **SUBMITTALS**

- .1 Submit test reports for review by Consultant. Include in Operating and Maintenance Manual. Comply with Section 01 33 00.  
.2 Submit test data in a machine readable format approved by the Consultant. Submit a "reader" program designed and as required for use with the test data file.  
.3 Submit a hard copy version of each test report. Use two-sided printing where practicable.  
.4 Submit a PDF® (portable document format) version of each test report.  
.5 Submit a summary report for each copper cable indicating pass/fail and length for each cable tabulating each result by cable number.  
.6 Submit a summary report for each optical fibre strand indicating insertion loss for each strand tabulating each result by cable sheath and strand number.  
.7 Submit detailed test results for all copper and optical fibre cables including backbone and distribution communications cables.  
.8 Deliver the reports in a media format selected from the following:  
.1 CD-ROM  
.2 DVD/R-RW  
.9 Within thirty days of award of Contract but no later than ten days before site mobilization of forces, submit evidence from each third party warranting performance guarantees of any part of the cabling system of their agreement that testing and site inspection procedures are fit for the purpose of upholding the warranty.  
.10 Submit test and field reports before submitting claim for Substantial Performance.

1.4 **TEST REPORTS**

- .1 For each check and test performed prepare and submit a test report, signed by the test Engineer, and where witnessed, by the Consultant.  
.2 Test reports to include a record of all tests performed, methods of calculation, date and time of test, ambient conditions, names of testing company, test Engineer and witnesses, also calibration record of all test instruments used together with manufacturers name, serial number and model number.

- .3 Calibration record to include performance level of test equipment.
- .4 Tests performed with instruments that have not been calibrated or certified as Fit For Purpose within twelve months preceding the date of use may be rejected at sole discretion of the Owner.
- .5 Undertake either full or sample testing daily and have reports available for review by the Consultant as an assurance that standards of working practices are being maintained.
- .6 Complete test records and certification of such records prior to Project cutover or beneficial use of the facility by Owner.
- .7 Configure the test equipment according to the cable under test. Install Product specific parameters.

1.5 **MANUFACTURER'S ATTENDANCE**

- .1 Provide manufacturer's representatives to verify installation practices for each part of the Work as may be relevant to all components including wiring and terminations.

1.6 **FIELD INSPECTION**

- .1 Provide field Engineer for inspection and certification of facilities during installation, testing and commissioning as required.
- .2 Concurrent with testing, perform visual inspection of all exposed cable to verify compliance with bend radius protection, sheath protection and protection against harsh environment.
- .3 Perform visual verification that all cables, outlets, jacks and patch cords are labelled according to this Specification. Confirm that cable numbers and jack numbers align.
- .4 Prepare and submit to the Consultant, summary report attesting to the findings of the field inspection.

1.7 **QUALITY ASSURANCE**

- .1 These Specifications supplement the Electrical and Electronic Manufacturers Association of Canada, Canadian Standards Association standards, Electronic Industries Association, Telecommunications Industries Association standards and recommendations. Conditions of the EEMAC, CSA, EIA, TIA and ISO/IEC standards and recommendations apply unless superseded or modified by this Specification.
- .2 Where requirements of the Specifications exceed referenced standards, the Specifications apply. Where standards differ between authorities, the most rigid applies.
- .3 Requirements of the Specifications that are substandard to referenced standards should be brought to the attention of Consultant during bidding period.
- .4 Where any part of the Work fails tests or fails visual inspection, replace the defective material.
- .5 Where any part of the Work fails tests and that Work is to be built without physical discontinuity, remove the offending material and install new without increase in cost to the Contract.
- .6 Identify and indicate in the test results, the type/style/category/product number of cables under test.

- .7 At the reasonable discretion of the Engineer, replace cable or cabling components that fail performance tests, or fail to comply with work practices described in TIA and BICSI published standards and with practices published by the vendor of cabling used on the Project. Make these replacements at no cost to the Project, not in material cost, nor labour charges, nor in delays incurred to make such replacements.

## 2 Products

### 2.1 **TEST INSTRUMENTS**

- .1 Use only one style of test instrument for all measurements; use instruments of only one manufacturer for all measurements.
- .2 Use instruments manufactured by one of the following:
  - .1 Agilent
  - .2 Fluke

## 3 Execution

### 3.1 **MATERIAL ACCEPTANCE**

- .1 Before installing any cable on site, perform the following material acceptance tests:
  - .1 Perform OTDR and flux loss measurements on optical fibre cable after delivery to site and before installation. Prepare summary report and submit as a Shop Drawing to the Engineer for review. Reject material which fails performance tests or appears physically damaged.
  - .2 Perform visual inspection tests on communications cables after delivery to site and before installation. Reject material which fails performance tests or appears physically damaged.
  - .3 Perform full performance testing on samples removed from each spool of communications cable after delivery to site and before installation. Submit the test results to the Engineer for review as a Shop Drawing. Record the manufacturer's production data as imprinted on the cable sheath. Use a cable sample of physical length 50 meters  $\pm$  500 mm. Retain sample for further testing until after Shop Drawings are returned as "Reviewed as Submitted".

### 3.2 **VISUAL AND MECHANICAL INSPECTION**

- .1 Immediately following installation of cables and connector hardware, perform the following visual and mechanical inspections:
  - .1 Compare cable, connectors and splice data with Drawings and Specifications.
  - .2 Inspect cable and connectors and connections for physical and mechanical damage.
  - .3 Verify that all connectors and splices are correctly installed.
  - .4 Verify colour and marking identification is correctly installed.

### 3.3 **ELECTRICAL TESTING**

- .1 Test horizontal and backbone copper cables according to the following criteria:

- .1 Cable length measurement and construction defect inspections.
- .2 Connector integrity tests.
- .3 Cable and connector attenuation and performance testing.
- .4 For cables up to and including Category 3, test all pairs of each horizontal and backbone cables for continuity, short circuits, open circuits, continuity to ground, correct polarity, length, attenuation and near end crosstalk to a minimum of 16 MHz. Perform tests in accordance with TIA 568B.
- .5 For Category 5, and 5e cabling, test all pairs for continuity, short circuits, open circuits, continuity to ground and correct polarity. Test each cable for length, attenuation, near end crosstalk, far end cross talk, delay, delay skew to a minimum of 350 MHz. Perform tests in accordance with TIA 568B.
- .6 For Category 6 cabling, test all pairs for continuity, short circuits, open circuits, continuity to ground and correct polarity. Test each cable for length, attenuation, near end crosstalk, far end cross talk, delay, delay skew to a minimum of 650 MHz. Perform tests in accordance with TIA 568B.
- .7 For Category 6A cabling, test all pairs for continuity, short circuits, open circuits, continuity to ground and correct polarity. Test each cable for length, attenuation, near end crosstalk, far end cross talk, delay, delay skew to a minimum of 1000 MHz. Perform tests in accordance with TIA 568B.
- .8 For Category 6A cabling, and on request of the Engineer, conduct tests to 1000 MHz for alien cross talk measurements on an audit basis as per TIA 568 B2-10 on two samples of six-around-one cable sets selected by the Engineer.
- .9 Test coax cabling for center conductor continuity, shield continuity, impedance (75 ohms), attenuation to limits dependent on the application as described in TIA 942-1.
- .2 Test optical fibre cable according to the following:
  - .1 Cable length measurement, fibre fracture inspection and construction defect inspections using an Optical Time Domain Reflectometer (OTDR).
  - .2 Connector and splice integrity tests using an OTDR.
  - .3 Cable attenuation and loss measurements using an optical power loss test set.
  - .4 Test every fibre of each cable with an OTDR for length and attenuation. Include a hard copy chart recording with the test documentation.
  - .5 Test every fibre of each cable with a power meter/light source combination in both directions. Tabulate and include test results with the test documentation.
  - .6 Multi Mode Fiber
    - .1 Perform factory tests for loss measurements at 850 nm and 1300 nm in both directions using a source and power meter calibrated at these wavelengths. Perform the tests using an LED source. Comply with procedures described in FOTP-171 Methods A1 or D1, or FOTP-34 Method A2. Archive measurement results electronically showing pass/fail results measured using limits provided in TIA 568-C.3 and deliver with viewer/reporting software.

- .2 Perform testing with an optical time domain reflectometer using a launch fiber at both ends. Submit OTDR trace data along with a viewer program. Submit OTDR event table showing reflective events with an absolute value less than 50 dB return loss and non-reflective events with a loss value greater than 0.1 dB.

.7 Single Mode Fiber

- .1 Perform tests for loss measurements at 1310 nm and 1550 nm in both directions using a source and power meter calibrated at these wavelengths. Comply with procedures described in FOTP-171 Methods A3 or D3, or FOTP-34 Method B. Measure against limits provided in TIA-568-C.3. Archive measurement results electronically and show pass/fail results delivered with viewer/reporting software.
- .2 Perform testing with an OTDR using a launch fiber at both ends. Submit OTDR trace data along with a viewer program. Submit OTDR event table showing reflective events with an absolute value less than 50 dB return loss and non-reflective events with a loss value larger than 0.1 dB.
- .3 For single mode fiber runs longer than five km deployed for 10 Gbps or higher rates, measure chromatic dispersion showing absolute dispersion at 1550 nm and polarization mode dispersion. Record and submit results for these fibers in addition to the tests above.

.3 Test Values

- .1 Assemble test results and submit to the Engineer in a timely manner.
- .2 Analyze the results and repair or replace cabling so that the Work results comply with the Specifications.
- .3 Verify that the installed cabling conforms to the manufacture`s Specifications.

3.4 **REPAIRS**

- .1 Replace defective or damaged cables and components and re-execute tests.
- .2 Replace defective cables without splicing where splicing is not permitted.

### 1.3

#### **DEFINITIONS**

- .1 Accept the following definitions of terms used within this document
  - .1 Approved sole equivalent. A single Product proposed by the Bidder to displace a named Product as being beneficial to the Contract and which has been reviewed and accepted by the Owner as suitable and acceptable as the only substitute to the named Product.
  - .2 Sole manufacturer: One only manufacturer of indicated Products to the exclusion of all other manufacturers.

### 1.4

#### **ABBREVIATIONS**

- .1 Not specified

### 1.5

#### **SYSTEM DESCRIPTIONS**

- .1 Structured Cabling – Outside Plant
  - .1 Extensions of existing outside plant facilities to new locations in doors.
  - .2 Interception, modification, expansion and improvements to existing incoming carrier pathways where previous pathways exist.
- .2 Structured Cabling – Architecture
  - .1 Organized system of information systems extra low voltage power limited copper cabling arrayed as individual communications channels between end point device connections.
  - .2 Communications channels indicated as *network channels* to operate at 1 Gbps data transfer rate consisting of 8 conductor small gauge copper conductors arranged as four-independently twisted pairs in a common unshielded flame spread rated plastic sheath.

- .3 Organized systems of information systems extra low energy optical fibre cabling arrayed as individual communications channels between end point device connections.
- .4 Communications channels indicated as *network channels* to operate at up to 10 Gbps consisting of two strands of multimode optical fibre in a common sheath sometimes shared with other like fibre strands.
- .5 Network subscribing field devices arrayed in the work area each attached to a network channel outlet jack by work area equipment patch cord.
- .6 Network energizing equipment aggregated in centrally located telecommunications spaces.
- .7 Network energizing equipment attached to network channels by equipment patch cords.
- .8 Network terminations aggregated on common rack mounted patch panels in centrally located telecommunications spaces.
- .9 Work area network outlet terminations mounted on work area faceplates individually, or shared with other like outlet terminations.
- .10 Work area network outlets mounted on faceplates mounted on furniture outlet mounts, electrical conduit wall and surface mounted enclosures.
- .11 Network channels terminated at each end with a connector firmly attached to the fabric of the premises or firmly attached to a faceplate within furniture and fixed to the premises.
- .3 Communications Pathways
  - .1 Comply with TIA 569.
  - .2 Avoid exceeding cable pathway occupancy density of 40% measured by cross section area. Report to the Consultant occurrences where occupancy density exceeds 40% in cable trays or cable runways or optical fibre overhead raceways.
  - .3 Communications pathway infrastructure complying with this document and Division 26 of this Specification.
  - .4 Cables fully enclosed by continuous conduits or continuous cable tray or optical fibre containment raceways or within electrical utility rooms or combination to achieve a fully protected cable distribution system.
  - .5 Optical fibres in medium to large telecommunications rooms or communications equipment rooms in dedicated fibre management raceways with controlled cable entry and descent pathways.
  - .6 Optical fibre cables in cable trays protected by flexible thin wall non-metallic electrical inner duct conduit.
  - .7 Optical fibre cables exposed in cable tray in airborne oil environments installed in protective flexible liquid tight conduit.
  - .8 Communications pathways supplemented with multi-cell pre-lubricated flexible cloth detectable innerduct.
  - .9 Route diversity established by use of two separate and distinct conduits or cable trays or combination within 50 m of distribution point.
- .4 Communications Equipment Room Fittings
  - .1 General

- .1 Entrance protection devices to reduce damage due to overvoltage and over-current conditions on exposed cabling.
- .2 Communications cabinets racks, frames and enclosures and overhead supporting structures and associated components.
- .3 Cabling termination blocks, patch panels, as components of a structured cabling installation.
- .4 Runway mounted cable management systems.
- .5 Termination blocks for multi-pair copper cables.
- .6 Patch panels for 4-pair copper UTP network distribution cables.
- .7 Termination panels for optical fibre cabling.
- .8 Rack mounted cable management systems.
- .2 Cabinets racks, frames and enclosures
  - .1 Cabinets, racks, frames and enclosures as secure and managed spaces to support structured cabling components and network energizing equipment communications equipment, computer equipment, communication cabling terminations and power distribution strips, bars and accessories including inside mounting rails, vertical cable management accessories, air exhaust chimney, doors, side panels, air dams, door locks, with grounding bar securing and bracing brackets all by a sole manufacturer.
  - .2 Communications rack mounted power distribution, protection and power strips.
- .3 Air management and containment systems
  - .1 Overhead supported air management system of panels and supports and doors as supplement to equipment cabinets to create hot / cold air containment system.
- .4 Copper medium termination blocks
  - .1 Termination blocks and patch panels for structured cabling systems manufactured by a sole vendor furnished under a single manufacturer's warranty.
- .5 IDC termination blocks and patch panels
  - .1 IDC termination blocks
    - .1 Wall or backboard mounted insulation displacement wire termination strips in multiples of fifty pins (twenty-five pair) per strip, for 22-26 AWG conductor, inserted in wall mounted panels in assemblies of increments of 300 pairs, in "110" or "BIX" format as indicated; wall or backboard mounted wire management rings, troughs and accessories to match
  - .2 Communications patch panels
    - .1 Panels mounted on flat vertical surfaces, or rails within racks or frames supporting individual or modules of multiple cable terminations
    - .2 Panels supporting individual cable termination jacks
    - .3 Panels supporting cassettes of pre-terminated cable jacks
    - .4 Panels supporting individual optical fibre termination connectors

- .5 Panels supporting cassettes of preterminated optical fibre connectors
- .6 Communications cable management and ladder racking
  - .1 Rack mounted lateral cable retention strips; vertical rack mounted cable troughs; to retain and manage cables within a rack or enclosure.
  - .2 Cable runway supported overhead as open pathway for communications cabling and as support for cable, cable patch panels and power distribution conduits.
  - .3 Cable raceway supported overhead as protected covered pathway for optical fibre cabling, patch cables, providing support and escort into communications racks.
- .7 Communications distributed enclosures
  - .1 Custom surface mounted enclosures to accommodate DIN rail mounted cabling terminations and DIN rail mounted network energizing equipment including DIN rail cabling termination blocks, patch panels, as components of a structured cabling installation, DIN rail mounted termination panels for optical fibre cabling, DIN rail rack mounted cable management systems. Components to support structured cabling components and network energizing equipment.
  - .2 Overhead ladder racking cable runway support including fittings, structural supports, braces, rods and brackets necessary for suspension, attachment or support of communications cabinets, racks, frames and enclosures. Cable management guides and retainers, support brackets, section joining elements, horizontal bends, vertical inside/outside bends, wall support brackets, and ground bonding links all by a sole manufacturer.
  - .3 Rack mounted power distribution and power protection strips for in-rack power distribution, monitoring and control. Mounted vertically and horizontally.
- .5 Communications Copper Backbone Cabling
  - .1 Multi-pair copper pair cabling installed between termination panels within premises and between premises of common owner.
    - .1 Applications
      - .1 Voice frequency band telemetry
      - .2 Voice communications
      - .3 Data network 10 Mbps -100 Mbps,
    - .2 Exposed copper backbone cable protect against overvoltage conditions.
- .6 Communications Copper Backbone Terminations
  - .1 Multipair termination strips, wall or panel or surface mounted.
- .7 Communications Optical Fibre Cabling
  - .1 Multi-strand optical fibre cable.
    - .1 Multi-strand optical fibre of various types as indicated in the contract drawings.
    - .2 Multi-strand optical fibre cables to suit environmental conditions including
      - .1 Physical environments including

- .1 Indoor,
    - .2 Indoor/outdoor, and
    - .3 Outdoor
  - .2 Chemical / Climate conditions including
    - .1 Indoor – dry
    - .2 Indoor – damp
    - .3 Outdoor – damp
  - .3 Multi-strand optical fibre cables of various forms of construction including combinations of OFNP, OFNR, OFNG, loose tube, loose tube with water blocking barrier, tight buffer, tight buffer with water blocking barrier, steel armour, aluminum armour, steel armour with plastic outer jacket, aluminum armour with plastic outer jacket.
  - .4 Multi-strand field terminated and pre-terminated single mode and multimode optical fibre cable assemblies installed between termination panels within premises and between premises of common owner in support of the following applications:
    - .1 Data networking Ethernet: 1 Gbs, 10 Gbs,
    - .2 Data networking carrier: OC-3, OC-12, OC-48, OC-192
- .8 Communications Optical Fibre Terminations
  - .1 Multi-strand optical fibre terminations and couplers
    - .1 Optical fibre terminations of various types as indicated in the Contract Drawings.
    - .2 Factory terminated factory polished cable multi strand assemblies.
    - .3 Field terminated factory polished mechanical attached single strand connectors.
    - .4 Optical fibre termination adapters.
    - .5 Optical fibre field splicing tray and cassettes.
    - .6 Optical fibre rack mounting accessories.
    - .7 Optical fibre fan out cassettes.
- .9 Communications Optical Fibre Termination Enclosures
  - .1 Rack or wall or surface mounted enclosures or trays to accommodate optical fibre terminations, splice trays, and cable loops
  - .2 Accommodation for connector mounting faceplate adapter panels.
- .10 Communications Horizontal Distribution Cabling
  - .1 Four-pair shielded or unshielded copper cabling installed between termination panels and work area outlet in support of the following applications:
    - .1 Voice frequency band telemetry.
    - .2 Voice communications.
    - .3 Data network 10 Mbps, 100 Mbps, 1 Gbps, 10 Gps.
    - .4 Elevator communications intercom.

- .2 Multiple conductor cabling installed between termination panels or field devices and other field devices in support of the following applications:
  - .1 Building management systems.
  - .2 Premises security systems.
  - .3 Premises access and gate controls.
- .3 Modular connectors as terminations of horizontal distribution cables.
- .4 Multi-strand single mode or multimode field terminated or pre-terminated optical fibre cable installed between termination panels and work area terminations in support of the following applications:
  - .1 Data networking Ethernet: 1 Gbs, 10 Gbs, 40 Gpbs, 100 Gpbs.
- .5 Coaxial cables installed between termination panels and work area terminations in support of the following applications:
  - .1 Radio antenna connections.
- .6 Single pair copper cabling installed between termination panels and field devices in support of the following applications:
  - .1 Public address speaker distribution.
- .11 Work Area Faceplate
  - .1 Modular faceplate adapter for mounting on conduit box enclosures to mount single or multiple fixed or modular work area outlets for copper or optical fibre horizontal distribution cables and for audio / visual cable terminations.
- .12 Communications Connecting Cords, Devices, and Adapters
  - .1 Network cords installed between devices and cabling terminations to form or complete a communications channel:
    - .1 Copper medium
      - .1 Copper four-pair, unshielded patch cords of various lengths and colour
    - .2 Optical medium
      - .1 Optical fibre two-strand optical fibre single and multi-mode patch cords of various lengths; duplex LC to duplex LC connector polarity field adjustable A-A and A-B
      - .2 Optical fibre twelve-strand, single mode and multi-mode patch cords of various length
      - .3 Common cord for configuration of 40-GBASE channels using either Method A and Method B or a combination of cabling arrangements compliant with TIA-568-C.0 by manual and non-intervention manipulation of in-field setting of connector pinning polarity and key polarity without need of tools
- .13 Antennas Communications Horizontal Cabling
  - .1 Network wireless access points
    - .1 Horizontal distribution cabling connection from wireless access point to network active device in telecommunications room or enclosure.
    - .2 Wireless access point
      - .1 Comply with Section 27 20 00

## 1.6 **SHOP DRAWINGS SUBMITTALS**

### .1 General Instructions

- .1 Comply with Specification Section 01 33 00.
- .2 Shop Drawings issued and reviewed before construction.
- .3 Retain the services of a person accredited by BICSI as a Registered Communications Distribution Designer (RCDD) to review and stamp shop drawings submitted under this division of work to attest to compliance with contract specifications.

### .2 Shop Drawings

#### .1 Submit Shop Drawings for field installations

- .1 Telecommunications rack equipment elevations for telecommunications rooms, data centre, and AV systems indicating outlet placement and identification of cable terminations by type and by administration labels.
- .2 Wall elevations for telecommunications rooms, data centre, AV equipment spaces.
- .3 Wall elevations and floor layout for carrier entrance rooms.
- .4 Spreadsheet file indicating location on patchpanel the termination of backbone cables and cabling with terminations in the equipment server room and telecom rooms.

#### .2 Submit Shop Drawings for communications systems Products

- .1 Cables and connectors.
- .2 Termination panels, patch panels, termination blocks.
- .3 Work area faceplates and outlet connectors.
- .4 Manufactured items.
- .5 Enclosures and panels.
- .6 Cable runway and racking.
- .7 Optical fibre raceway systems and accessories
- .8 Cable management accessories.

#### .3 Submit Shop Drawings to justify and explain proposed deviations from the design depicted in the Contract Documents.

#### .4 Submit Shop Drawings for manufactured assemblies

- .1 Telecommunications industrial wall mount enclosures.
- .2 Overhead heat containment baffles.

### .3 Samples

- .1 Submit test results of cable samples.
- .2 Comply with Specification Section 27 08 00.

### .4 Manufacturer's Field Reports

- .1 Provide manufacturer's representative to prepare pre-installation report on communications cabling infrastructure as pre-construction condition in support of manufacturer's warranty. Submit copy of report for Owner's review four weeks before installation commences.

- .2 Obtain statement from manufacturer attesting to fulfillment of terms of manufacturer's warranty. Submit copy of statement for Owner's review four weeks before installation commences.
  - .3 Provide services of manufacturer's representative to conduct periodic site reviews and prepare summary reports of work in progress. Submit each report for Owner's review within two days of observation on site.
  - .5 Close Out Submittals
    - .1 Comply with Section 01 10 00.
    - .2 Submit as-constructed drawings indicating any deviation of cabling, cable administration, and routing from as shown on Contract Drawings.
- 1.7 **QUALITY ASSURANCE**
- .1 Qualifications
    - .1 Comply with requirements of Section 27 05 00.
  - .2 Certifications
    - .1 Comply with requirements of Section 27 05 00.
  - .3 Field Samples
    - .1 Provide minimum of one field sample of each colour and type of component for use in the Work. Submit samples for Owner's review with sufficient lead time to allow modification of Product at Owner's discretion and with a minimum of two weeks before commencement of installation.
    - .2 Provide representative sample of factory manufactured cable assemblies. Submit samples for Owner's review with sufficient lead time to allow modification of Product at Owner's discretion.
  - .4 Pre-Installation Meetings
    - .1 Arrange for and attend pre-installation design and construction meetings. Attendees at meetings to include site work supervisor and technical design supervisor.
      - .1 Minimum of one meeting to review the Contract scope of work.
      - .2 Minimum of one meeting to review the proposed execution of the work.
  - .5 Site Meetings
    - .1 Arrange for and attend construction progress meetings. Attendees at meetings to include site work supervisor and technical design supervisor.
      - .1 Minimum of two site meetings per month commencing on day of mobilization and running until four weeks after site work completion.
- 1.8 **DELIVERY, SHIPPING, HANDLING AND UNLOADING**
- .1 Acceptance at Site
    - .1 Examine Products delivered to site.
    - .2 Reject Products that appear damaged or unfit for use.
    - .3 Verify quality of components. Comply with requirements of Section 27 08 00.
  - .2 Storage and Disposal
    - .1 Maintain a sufficient supply of components to execute and complete the Work.
    - .2 Store and protect the supply of components against loss or damage.

- .3 Make good losses or damages without penalty to the Owner.
- .4 Comply with conditions of site housekeeping and waste removal in the Specifications.

1.9 **WARRANTY**

.1 General Terms

- .1 Provide best warranty available from component vendor; provide as a minimum a warranty as described in the Project Specifications.
- .2 Perform the Work according to the terms dictated by the manufacturer to obtain the best warranty offered by the manufacturer.
- .3 Submit the manufacturer's warranty declaration to the Owner.
- .4 Arrange for the Owner to receive documents to support the manufacturer's extended warranty.

1.10 **COMMISSIONING**

- .1 Execute testing and compliance measurements to comply with Section 27 08 00.
- .2 Submit results to the Owner for review.

1.11 **MAINTENANCE**

- .1 Clean and inspect all optical fibre connections before handing over the installation.
- .2 Provide inspection reports including photographic images of all optical fibre terminations optical mating surfaces.

2 Products

2.1 **MANUFACTURERS**

.1 Manufacturers – General

.1 Manufacturers - Stipulated

- .1 Products by stipulated manufacturer or manufacturers where identified on the contract drawings without substitution.

.2 Manufacturers – Equal

- .1 Products by manufacturer or manufacturers where manufacturer's products are approved as equal and as acceptable substitution expressly by the Owner or Owner's appointed representative.

.3 Manufacturers- Equivalent

- .1 Products by manufacturer or manufacturers where manufacturer's products are functionally and materially identical or superior to the specified product.
- .2 Proof or evidence of equivalence submitted on demand by the Owner.
- .3 Contractor accepts financial and temporal risks on failure of products to meet conditions of equivalency determined at the sole discretion of the Owner or the Owner's appointed representative.

.4 Manufacturers - Voluntary

- .1 In absence of an indicated manufacturer, a sole manufacturer in common with manufacturer of specified copper cabling components.

- .2 In absence of an indicated manufacturer or manufacturer of specified copper cabling products, a sole manufacturer selected from list of recognized manufacturers listed by class of product.
- .5 Manufacturers – Recognized
  - .1 Manufacturers identified in the sections below by class of product.
- .6 Manufacturers - Substitution
  - .1 Acceptable as substitution of products by a sole manufacturer are products supplied by a business joint venture between a cable manufacturer and component manufacturer represented by either party as a sole provider and furnished under a single manufacturer's warranty where such substitution is of demonstrable material or performance benefit to the Owner. Substitution conditional on express approval by the Owner or Owner representative.
- .2 Communications Equipment Room Fittings
  - .1 Equipment racks – floor mounted
    - .1 Hammond
  - .2 Equipment frames – floor mounted
    - .1 Not specified
  - .3 Equipment cabinets – surface mount
    - .1 Hammond
  - .4 Industrial enclosures – surface mount
    - .1 Hammond
  - .5 Power distribution strips
    - .1 Liebert
  - .6 Termination blocks and patch panels
    - .1 Copper cabling termination blocks
      - .1 Belden – BIX series
    - .2 Copper cabling patch panels
      - .1 Panduit
    - .3 Optical fibre cabling system components
      - .1 Comply with 271000.1
  - .7 Overhead cable runway and accessories
    - .1 Chatsworth Products Inc.
    - .2 Cooper Industries
    - .3 Middle Atlantic
- .3 Communications Optical Fiber Cabling
  - .1 Sole manufacturer
    - .1 Optical fibre cabling of double- or multi- strand, single mode or multimode, field terminated or pre-terminated, panel mounted coupling connectors, termination panels, pre-terminated cable assemblies, work area patch

- cables, telecommunications room equipment patch cables, by a sole manufacturer of optical fibre products.
- .2 Termination housings and enclosures, work area outlet, work area outlet faceplate compatible with optical fibre products
- .2 Manufacturers
  - .1 Optical fibre cables, terminations and accessories
    - .1 Corning Cabling
  - .2 Comply with 271000.1
- .4 Communications Copper Backbone Cabling
  - .1 Sole manufacturer
    - .1 Sole manufacturer in common with copper distribution cabling and cabling components
  - .2 Manufacturers
    - .1 Copper – single pair
      - .1 Copper conductor 12 ga to 20 ga insulated to 300 V
        - .1 Comply with Division 26
    - .2 Copper – multiple conductor non-pair
      - .1 Copper conductors 12 ga to 24 ga insulated to 300 V
        - .1 Comply with Division 26
    - .3 Copper – multi pair, with pair count greater than four.
      - .1 General Cable
      - .2 Belden
      - .3 Comply with 271000.1
- .5 Communications Coaxial Cabling
  - .1 Manufacturers
    - .1 Match to existing
- .6 Communications Coaxial Splicing and Terminations
  - .1 Coaxial cable terminations, patch panels
    - .1 Panduit
- .7 Audio-Video Communications Cabling
  - .1 Shielded pair and multi pair
    - .1 Belden
- .8 Paging Communications Cabling
  - .1 Copper one pair 10 ga to 20 ga, insulated 300V
    - .1 Product and manufacturer
      - .1 Not specified
- .9 Antennas Communications Cabling
  - .1 Coaxial type, multi conductor, pre-terminated and connectorized

- .1 Match to existing
    - .2 Wireless access points cabling and accessories
      - .1 Horizontal cabling to comply with section on communications copper distribution cabling
  - .10 Communications Copper Distribution Cabling
    - .1 Copper category four-pair unshielded cable, panel mounted connectors, termination panels, pre-terminated cable assemblies, work area outlet, work area outlet faceplate, work area patch cables, telecommunications room equipment patch cables, all products by a sole manufacturer
      - .1 Manufacturers
        - .1 General Cable
        - .2 Comply with 271000.1
  - .11 Communications Faceplates and Connectors
    - .1 Wall faceplates
      - .1 Same manufacturer as specified for horizontal data cabling.
    - .2 Furniture adapter faceplates, system furniture adapters, modular furniture adapters
      - .1 Same manufacturer as specified for modular and systems furniture.
  - .12 Communications Connecting Cords, Devices, and Adapters
    - .1 Communications copper patch cords
      - .1 Same manufacturer as specified for copper distribution cabling.
    - .2 Communications optical fibre patch cords
      - .1 Same manufacturer as specified for optical fibre distribution or backbone cabling.
- 2.2 **COMPONENTS**
  - .1 Communications Equipment Room Fittings
    - .1 Communications cabinets racks frames and enclosures
      - .1 General
        - .1 Cabinets, racks, frames and equipment enclosures consisting of equipment cabinets, inside mounting rails, inside power distribution strips, vertical cable management accessories, air exhaust chimney, doors, side panels, air dams, door locks, securing and bracing brackets all by a sole manufacturer
        - .2 Wall mounted optical fibre termination enclosures
        - .3 Grounding bar and grounding jumpers installed in each
          - .1 Wall mounted open frame
          - .2 Communications cabinet enclosure or
          - .3 Any other form of equipment enclosure
      - .2 Wall, pole and surface mount industrial enclosures
        - .1 Provide enclosure of Type ID indicated on Contract Drawings

- .2 Comply with 271000.1
- .3 Network communications / server cabinet enclosure
  - .1 General
    - .1 Provide cabinet enclosure equipment rack of Type ID indicated on drawings possessing characteristics drawn from table below for same Type ID.
    - .2 Comply with 271000.1.
    - .3 Communications floor mounted free standing cabinet for mounting network equipment and cabling terminations on 483 mm panels.
    - .4 Frame grounding lug to CAN/CSA C22.1; grounding connection to frame from grounding lugs on removable elements.
  - .2 Cabinet fixtures
    - .1 Quick release removable side panels; Solid roof plate secured to prevent removal from outside the cabinet.
  - .3 Door style
    - .1 Two sets keys milled to Owner specified combination.
    - .2 Single front ventilated door with reversible hang and
    - .3 Split rear ventilated doors;
    - .4 Quick release hinges; opening range greater than 180 degrees;
    - .5 Effective ventilation ratio of 85% by area for front, rear and roof;
    - .6 Frame grounding lug to CAN/CSA C22.1; grounding connection to frame from grounding lugs on removable elements.
    - .7 Metal parts powder coat painted otherwise chrome or cadmium plated.
    - .8 Colour: Industrial light grey (RGB 215-215-215) RAL 7035.
    - .9 Flammability of plastic components to UL94V-1.
    - .10 Safety to IEC 60950.
  - .4 Door lock
    - .1 Keyed lock on front and rear keyed alike to side panel release;
    - .2 Two sets keys milled to Owner specified combination.
  - .5 Cabinet accessories
    - .1 Levelling feet; four casters.
    - .2 Vertical mounting rails adjustable without use of tools; Front and side mounting flange surface vertical mounting rails machine threaded 10-32 at spacing to EIA-310

- .3 Front and rear equipment mounting rails adjustable forward and backward for front and optional rear support; minimum setback of 75 mm from inside surface of front door, minimum offset of 38 mm between side rails and side panels; calibrated and marked in units of 44.45 mm.
- .4 Kit of sixty captive insert cage nuts M6 with washers and mounting bolts.
- .6 Air management
  - .1 Front panel blanking kit; plastic front mounting panels, full height in 1RU increments, black plastic
- .7 Instrumentation
  - .1 SNMP/Ethernet/IP monitor module to measure, report and alarm on open door, high temperature.
  - .2 Mounting for intrusion detector alarm switch.
  - .3 Door open detector switch on front and rear doors.
- .8 Server cabinets attributes
  - .1 Provide cabinets indicated as "SERVER" with components possessing the following change of attributes
  - .2 Change: Vertical mounting rails machine threaded 10-32 at spacing to EIA-310  
 Replace with: Vertical mounting rails surface square punched at spacing to EIA-310;
  - .3 Kit of sixty captive insert cage nuts M6 with washers and mounting bolts.
- .4 Cable management channel - inrack
  - .1 Four vertical cable management channels within equipment enclosures and outside equipment space
  - .2 Inside cable openings of 75 mm diameter minimum and outside cable openings of minimum two 100 mm x 100 mm and three 100 mm x 200 mm openings fitted with grommets on each side.
- .2 Products
  - .1 Provide Products indicated in table below corresponding to Type ID and approved manufacturer.
  - .2 Provide approved equivalent.

Table 1 - Network Communications Cabinet Enclosure – By Properties

Type ID	IP rating	NEMA	Rail width	Width	Depth	RU
E751-44	IP21	1	483mm"	762mm	1067mm	44

Type ID	HP	Panduit	Rittal	WrightLine	
EC032-44				Paramount side cable chase 44RU x 12 x 42	

- .6 Rack grounding bar
  - .1 General
    - .1 Grounding bar kit, rack mounted, 483 mm long, tin plated, predrilled to accept twenty thread forming installed 12-24 screws spaced at 15.9 mm, two cage nut bonding screws, four bonding nuts, to C22.2 No 41-13, UL 467, EIA-310.
    - .2 Two bolt grounding jumper kit, #6 AWG ground bonding conductor, compression lug terminated one end.
  - .2 Product
    - .1 Panduit RGRB19CN
- .7 Optical fibre enclosures-Interior
  - .1 Wall or surface mount metallic enclosures identified by Type ID below
  - .2 Accommodate optical fibre termination connector couplers, splice tray, loop storage
  - .3 Provide all accessories to complete fibre splice and connector terminations
  - .4 Swing door, exterior door lock
  - .5 IP / NEMA ratings
    - .1 NEMA 1
  - .6 Independent compartments for optional patch cords
  - .7 Accommodate splice trays by same or other manufacturer
  - .8 Accommodate coupler connectors by same or other manufacturer
  - .9 Styles with capacities of
    - .1 12 to 192 LC terminations in increments of 12
    - .2 Inline splice trays
  - .10 Accessories
    - .1 Splice tray with heatshrink splice protectors
    - .2 Coupler mounting plates
  - .11 Products
    - .1 Products and fibre splice & connector accessories by sole manufacturer

- .2 Approved Product by sole manufacturer of optical fibre cabling system products.
- .3 Approved manufacturer identified on contract drawings.
- .8 Optical fibre enclosures – interior/exterior
  - .1 Wall or surface mount metallic enclosures identified by Type ID below
  - .2 Stainless steel construction
  - .3 Accommodate optical fibre termination connector couplers, splice tray, loop storage
  - .4 Provide all accessories to complete fibre splice and connector terminations
  - .5 Swing door, exterior door lock
  - .6 IP / NEMA ratings
    - .1 NEMA 4X
  - .7 Accommodate splice trays by sole manufacturer
  - .8 Styles with capacities of
    - .1 144 inline splices connections
  - .9 Accessories
    - .1 Splice tray with heatshrink splice protectors
  - .10 Products
    - .1 Products and fibre splice & connector accessories by sole manufacturer
    - .2 Approved Product by sole manufacturer of optical fibre cabling system products.
    - .3 Approved manufacturer identified on contract drawings.

.2 Communications Terminal Blocks, Terminations, Connectors and Patch Panels

.1 Copper paired cables termination block strips

- .1 Termination of unshielded twisted pair copper multipair cables.
- .2 Termination blocks as fixed wall or surface or rack mounted terminations of backbone or distribution cabling.
- .3 Insulation displacement terminations for solid copper conductors between 24 AWG – 20 AWG.
- .4 Termination of shielded twisted pair copper multipair cables with grounding bar.
- .5 Termination strips or wafers panel mounted in groups of fifty through three hundred terminations in increments of fifty.
- .6 Strips in industry format “110” type or “BIX” type.
- .7 Flat wall mount panels for support of multiple BIX wafers; panels in multiples of 250 or 300 terminations; cable dressing spacers between adjacent panels.
- .8 Flat wall mount support for single or multiple 110 type strips.
- .9 Match performance of termination block to performance of cable being terminated.

.2 UTP 4-pair cable termination rack mount patch panels

- .1 Patch panels consisting of multiple single position 8P8C (RJ45) jacks or six-position modules of preformed 8P8C (RJ45) jacks, 22-26 AWG IDC connection block for solid or stranded wire to TIA 568B pinning, panel format with lands for individual port identification labels and panel identification label, forming panels of twelve, twenty-four, or forty-eight or seventy-two ports per panel. Cable retention bar and back-of-panel cable support and strain relief bracket to secure cable perpendicular to panel; colour: Black.

.2 Products

- .1 Products of the type ID indicated on the Contract Drawings and manufactured by approved manufacturer listed in the table following.

Table 11 - Termination Patch Panels - UTP 8P8C - By Properties

.4 Copper medium jacks

.1 UTP and STP 2-pair 4P4C jack – non-keyed

- .1 Modular plastic formed telecommunications four-pin four-conductor outlet jack non-keyed, comply with ANSI/TIA/EIA 568 specification and CSA T529, compatible with flush- and surface-mount telecommunications outlet faceplates, modular furniture faceplate adapters, utility service pole adapter plates, floor box adapter plates, conduit poke-through adapter plates for termination of unshielded and shielded twisted pair cables.

.2 Colour: Black or as indicated on the drawings.

.3 Products

.1 Provide Products of the type ID indicated on the Contract Drawings and manufactured by approved manufacturer listed in the table following.

.2 Comply with 271000.1

.5 Optical fibre termination connectors

.1 Field installed discrete connectors as terminations for optical fibre strands in single or multi-stranded cable assemblies

.1 For installation on fibres of 250 micron, 900 micron tight buffer, 2 mm jacketed, 3 mm jacketed

.2 Type LC, LC duplex, SC, SC duplex, and ST

.3 Multimode OM1, OM2, OM3, OM4 performance: Insertion loss maximum 0.5 dB, typical 0.2 dB, return loss minimum 25 dB

.4 Single mode OS1, OS2 connectors

.1 Finished to UPC (Ultra Physical Contact) with insertion loss maximum 0.5 dB, typical 0.3 dB, return loss minimum 50 dB

.2 Finished to APC (Angled Physical Contact) with insertion loss maximum 0.5 dB, typical 0.3 dB, return loss minimum 60 dB

.2 Field fusion splice connector pigtail assemblies as terminations of single, dual and multi-stranded optical fibre cable assemblies

.1 For installation on fibres of 250 micron, 900 micron tight buffer, 2 mm jacketed, 3 mm jacketed

.2 Type LC, LC duplex, SC, SC duplex, and ST

.3 Multimode OM1, OM2, OM3, OM4 performance: Insertion loss maximum 0.5 dB, typical 0.2 dB, return loss minimum 25 dB

.4 Single mode OS1, OS2 connectors

.1 Finished to UPC (Ultra Physical Contact) with insertion loss maximum 0.5 dB, typical 0.3 dB, return loss minimum 50 dB

.2 Finished to APC (Angled Physical Contact) with insertion loss maximum 0.5 dB, typical 0.3 dB, return loss minimum 60 dB

.5 Single pigtails

.1 900 micron tight buffered

.2 2 mm and 3 mm zip interconnect cable

.3 LC terminated in kit of 12 TIA colour coded

.6 Duplex pigtail

.1 900 micron tight buffered

.2 2 mm and 3 mm zip interconnect cable

- .7 Twelve-fibre ribbon pigtails formed and made ready to mass fusion terminate twelve strand ribbon
  - .1 Jacketed or not jacketed
  - .2 MPO terminated 250 micron loose
  - .3 LC terminated in kit of twelve TIA colour coded
- .8 Products
  - .1 Provide Products of the type ID indicated on the Contract Drawings and manufactured by approved manufacturer listed in the table following.
  - .2 Comply with 271000.1

OFMA-6-LD	CCH-CP12-E4			

.2 Optical fibre termination cassette

.1 Not specified

.3 Communications Cable Management and Ladder Rack

.1 Rack mounted cable management devices and accessories. High capacity cable managers for horizontal mounting in 483 mm racks, cabinets or frames, complete with removable dual hinged covers, cable management fingers, front and optional rear pathways, suitable for cables of diameter 8.0 mm, manufactured of plastic with optional removable covers of metal or plastic, channel depth greater than 150 mm, colour black

.2 Cable managers in modular units of one, two, three or four rack units.

.3 Overhead ladder racking cable runway and accessories

.1 Cable runway

- .1 UL classified 38.1 deep tubular side stringer, 25.4 x 12.7 rails, welded, spaced at 230, steel, 300 mm wide.
- .2 Length 2959 mm.
- .3 Radius bend connecting section ninety degrees vertical, external and internal.
- .4 Radius e-bend section ninety degrees horizontal.
- .5 Radius cable drop.
- .6 Radius corner bracket.
- .7 Colour: gold over zinc.

.2 Cable runway accessories

- .1 Support "C" clips, couplers, to match and by same manufacturer as runway.

.3 Products

- .1 Chatsworth Products: 11275-012
- .2 Approved sole equivalent

Table 28 - Ladder Racking Runway - By Manufacturer

	CPI	Cooper	Middle Atlantic		
Tubular stringer	11275-012	SB17T			
Solid stringer					

.4 Racking accessories

- .1 Front of rack mounted shelving, 380 mm deep, ventilated, support capacity 23 kg one or two rack units high.
- .2 Products
  - .1 Same manufacture as for equipment cabinets

.4 Rack Mounted Power Distribution Strip

.1 General

- .1 Power distribution strips fully compatible with equipment cabinets and racking
- .2 Power strips with flexible connection whips terminated with lockable twist lock plugs of length sufficient to reach power distribution outlets

.2 Monitoring

- .1 Provide distribution strips with integrated power monitoring where indicated
- .2 Metered units with digital RMS current monitoring, local display, with SNMP reporting and alarm indication

- .3 Power strips formats
  - .1 30A 230V L6-30P; 42 x IEC C13, Metered

- .5 Communications Copper Backbone Cabling
  - .1 General
    - .1 Provide CMP rated Backbone cables except where expressly indicated otherwise.
    - .2 Provide CMP or CMR rated backbone cables where no portion of the entire length of cable is exposed to air contact within an air supply or air return plenum or air within an enclosed space.
    - .3 Provide CMP or CMR rated backbone cables where cables are contained within electrical communications utility rooms possessing a fire rating of one-hour or continuous electrical raceway or combination.
    - .4 Avoid using cables outdoors if characterized for inside use
    - .5 Comply with 271000.1
    - .6 Provide cable of the type ID indicated on the Contract Drawings possessing the attributes and characteristics indicted by the table below
  - .2 Copper backbone cable - Inside
    - .1 Multi-pair powersum 24 AWG solid annealed copper twisted pair 100 Ω characteristic impedance cable per ANSI/EIA/TIA 568 in identified binder groups, formed as compact core, covered by dual polyolefin/polyvinyl chloride insulation and an Alplast sheath, cable jacket
  - .3 Apply the following definitions to the terms appearing in the table:
    - .1 Type ID: The cable designation as it appears in the Contract Documents
    - .2 Pair: The number of twisted pairs of conductors in a common sheath
    - .3 Form:
      - .1 U designates unshielded cable;
      - .2 S designates cable protected by an overall electromagnetic shield;
      - .3 F designates cable or individual pairs protected by individual foil electromagnetic shielding.
    - .4 Cat: The performance of the cable further defined within TIA-568 as the performance category of cable
    - .5 Outdoor: Indicates the cable construction is suitable for use outdoors

- .6 Armour: The cable is protected by an outer protective armoured casing
- .7 Blocked: The cable is protected against ingress of water
- .8 Bury: The cable is suitable for direct burial applications
- .4 Manufacturer
  - .1 Use products where specifically identified by Manufacturer in the tables below

Table 31- Unshielded Copper Backbone Cabling – By Properties

Type ID	Pair	Form	Cat	Outdoor	Armour	Blocked	Bury
C52	25	U/UTP	3	No	No	No	No

Table 32 - Unshielded Copper Backbone Cabling – By Manufacturer

Type ID	Belden	Panduit	Systemax	General Cable
C52	DPLN25			2131505

- .6 Communications Optical Fibre Backbone Cabling
  - .1 General
    - .1 Cable of type indicated Contract Drawings possessing characteristics identified in tables below.
  - .2 Manufacturer
    - .1 Use products identified by Manufacturer in the tables below
    - .2 Use products manufactured by Corning to exclusion of all others.
  - .3 Fire rating
    - .1 Cable jacket rated OFNP or OFCP.
    - .2 Cable jacket rated OFNR or OFCR or OFNG or OFCG where permitted by local electrical and building safety codes, unless specifically excluded in this contract.
  - .4 Comply with Section 27 10 00.1

Table 33 - Multimode Fibre, Indoor/Outdoor (Service) by Strand Count, Performance

Type ID	Strand	Env	Purpose	Construction	Armor	dia		Core	Perf	Term

Table 34 - Mutlimode (Service) Type Cable - By Manufacturer

Type ID	Belden	Corning	Panduit	
MS1241		012T8P-31190-A3		

- .7 Communications Optical Fibre Trunk cabling: modular terminated
  - .1 General
    - .1 Ribbon cable assemblies of twelve or twenty-four strand factory made consisting of multi-strand cable factory terminated with multi-fibre push-on pull-off (MPO) connecto(s) at two ends
    - .2 Pigtail assemblies, saem as ribbon assembly with one end not terminated
    - .3 LC Duplex break out cables, same as Ribbon assemblies with near end MPO termination, far end LC Duplex
  - .2 Cable
    - .1 Ribbon cable

- .1 Jacket diameter, nominally 2 mm, 3 mm
- .2 Performance type OM3, OM4, OM5, OS2
- .3 12 or 24 Strand
- .2 Fibre cable assembly with modular connector terminations of type ID indicated in table below
- .3 Terminations
  - .1 MPO style
  - .2 Polished to PC, UPC, APC.
  - .3 Multi strand with Polarity Maintenance
  - .4 Pinned (Male) or Not pinned (Female) and Gender field adjustable
  - .5 Not termination (pigtail)
  - .6 LC Duplex termination
  - .7 Fibre cable assembly termination of type modifier indicated in tables below
- .4 Polarity Maintenance
  - .1 Array trunk cabling using Method B polarity maintenance. Comply with TIA 568.0
  - .2 Multimode cable using Type B terminations with UPC polish
    - .1 Couplers using Type B (key up/Key up)
    - .2 Cassettes using Method B (Key up)

Table 35 - Optical Fibre Trunk Cables: Modular Connector Termination

Type ID+MODIFIER	Strand	Near Connector	Far Connector	Fibre Type

- .8 Audio-Visual Communications Horizontal Cabling
  - .1 HDMI extension cabling
    - .1 Cables of length less than 10 m, Factory made cable preterminated HDMI connectors on multi conductor copper cable.
    - .2 Cables of length greater than 10 m, Factory made cable preterminated with active HDMI transducers on optical fibre cable assembly.
- .9 Paging Communications Horizontal Cabling
  - .1 Comply with manufacturer's installation instructions for 70 V PA distribution.

- .2 2-#12 copper 300V insulated in flexible metallic armour.
- .10 Communications Horizontal Distribution Cabling
  - .1 Cable
    - .1 Four-pair twisted copper 24-23 AWG cables of characteristic impedance 100Ω; Fire rating to CMR (FT4) or CMP (FT6); performance to category class defined by TIA 568; additional EMI protection by conductive foil or metallic shield.
    - .2 Provide cables of type ID possessing characteristics drawn from the table below
      - .1 Outdoor cables
      - .2 Water blocked cables
      - .3 Armoured
      - .4 Direct bury
      - .5 Other
        - .1 HT: High tensile strength
    - .3 Category cables characterized to bandwidths
      - .1 Category 6A: 625 MHz
    - .4 Colour
      - .1 Select cable from tables below to qualify performance criteria.
      - .2 Select cable with same performance criteria and with jacket of colour to match requirements indicated in section on Administration and Identification.
      - .3 Where not indicated otherwise, select the following colours
        - .1 CAT-6A general purpose data cabling: BLUE
    - .5 Products
      - .1 Provide Products of type ID indicated on the Contract Drawing and by the indicated manufacturer.
      - .2 Provide Products same or better than Products identified below.
    - .6 Comply with Section 27 10 00.1A

Table 37 - Copper Horizontal Distribution Cabling - By Properties

Type ID	Form	Cat	EMI	Placement	Waterblock	Armour	Bury	other

- .2 Modular jacks
  - .1 Modular jacks mounted as a component of patch panels located in telecommunications equipment rooms:
    - .1 Comply with section "communications terminal blocks and patch panels"
  - .2 Modular jacks mounted on work area faceplate

- .1 Comply with section "communications faceplates and connectors"
- .3 Comply with 271000.1A
- .11 Communications Faceplates and Connectors (Jacks)
  - .1 Wall faceplates
    - .1 Comply with 271000.1
    - .2 Plastic faceplate, as cover to single or multi position electrical conduit outlet box, with capacity of one, two, three, four, six, ten outlets with flat or sloping face, to suit snap-in jack.
      - .1 Colour to match electrical faceplate, or else white if not specified.
      - .2 Blank cover plate to match.
      - .3 Manufacturer same as snap in jack.
    - .3 Stainless steel faceplate, as cover to single or multi position electrical conduit outlet box, with capacity of one, two, three, four, six, ten outlets with flat or sloping face, to suit snap-in jack.
      - .1 Blank cover plate to match.
      - .2 Manufacturer same as snap in jack.
    - .4 Stainless steel faceplate, with two phone mounting lugs, as cover to single position electrical conduit outlet box, with capacity of one outlet with flat face, to suit single keystone snap-in jack.
      - .1 Blank cover plate to match.
      - .2 Manufacturer same as snap in jack.
    - .5 Plastic faceplate, as cover to single position electrical square faced decorator style conduit outlet box, with capacity of one, two, three, four outlets with flat or sloping face, to suit snap-in jack
      - .1 Blank cover plate to match.
      - .2 Manufacturer same as snap in jack.
    - .6 Comply with manufacturer specified for horizontal data cabling.
  - .2 Furniture adapter faceplates, system furniture adapters, modular furniture adapters
    - .1 Plastic faceplate, as snap in mounting plate for single position furniture mounting plate of capacity of one, two, three outlets with flat or sloping face, to suit snap-in jack.
    - .2 Plate form compatible with furniture snap in mounting bracket.
      - .1 Colour to match electrical faceplate, or else black if not specified.
      - .2 Manufacturer same as snap in jack.
    - .3 Same manufacturer as specified for modular and systems furniture.
  - .3 Modular jack
    - .1 Modular jacks, 8P8C, 6P6C, 4P4C suitable for mounting in all faceplates identified, including flush- and surface-mount telecommunications outlet faceplates, modular furniture faceplate adapters, utility service pole adapter plates, floor box adapter plates, conduit poke-through adapter

- plates, rack mount modular patch panels, compatible with shielded panel and shielded cable options.
- .2 Comply with Specification and manufacturer for modular jacks described in section “communications terminal blocks and patch panels”.
- .3 Jacks with colour coded removable identification icon, and modular cable strain relief.
- .12 **Communications Connecting Cords, Devices, and Adapters**
  - .1 **Communications copper patch cords**
    - .1 Factory manufactured and tested patch cords of stranded copper conductor 24 or 28 ga, Unshielded Twisted Pair (UTP), solid or stranded, construction terminated in factory installed RJ45 plugs, of category equal to category of horizontal distribution cabling, of manufacturer equal to manufacturer of horizontal distribution cabling, cords of various length, and colour; diameter 3.8 mm.
    - .2 Patch cord supplied complete with factory test report detailing at least NEXT and electrical length (m)
    - .3 Performance to ANSI/TIA/EIA-1096A, IEC 60603-7, UL1863, CSA C22.2, IEEE 802.3af, 802.3at, temperature range of -40 °C to 60 °C. Polycarbonate housing toUL94V.
    - .4 Manufacturer equal to manufacturer of copper distribution cabling.
    - .5 Provide products as indicated by Type ID on the construct drawings drawn from the table below.

Table 39 - Copper Patch Cords - By Performance

Type ID	Shield	Category	Cond	AWG	Jacket	Pinning	Length (m)
U5-ST24-B-R-210	UTP	5E	stranded	24	CMR	568-B	2.10

- .2 **Communications optical fibre patch cords**
  - .1 Factory manufactured and tested optical fibre patch cords, two-strand terminated duplex LC – duplex LC, cord diameter 1.6 mm, of various lengths and colours. Connectors of low connector insertion / withdrawal force, and high cable retention force; to TIA/EIA-568-c.3, TIA-604-10, ISO/IEC 1101.
  - .2 Factory manufactured and tested optical fibre patch cords, twelve-strand terminated MPO-MPO cord diameter 3 mm, of various lengths and colours. Connectors of low connector insertion / withdrawal force, and high cable retention force; connectors field modified to be male/female, key-up/key down. TIA/EIA-568-c.1, TIA-604-5, ISO/IEC 1101.
  - .3 Performance to OM3, OM4, OS1, or OS2 equal to performance of fixed link cabling.
  - .4 Manufacturer equal to manufacturer of optical fibre distribution or backbone cabling.
- 3 **Execution**
  - 3.1 **PREPARATION**
    - .1 Protect cabling during installation against damage caused by later construction or by activities by others.
    - .2 In areas exposed to welding, protect cabling against damage due to weld fragments.

### 3.2 **INSTALLATION**

- .1 Communications Equipment Room Fittings
  - .1 Communications terminal blocks and patch panels
    - .1 Install patch panels in racking.
    - .2 Install jacks and connectors in panels.
    - .3 Mount wall mounted components on walls as indicated following manufacturer's recommendations.
    - .4 Protection
      - .1 Install protection modules.
      - .2 Install protection devices on exposed copper communication cables, following manufacturer's recommendations. Bond protection grounding terminal to building ground or electrical safety ground. Do not bond to telecommunications bond.
  - .2 Equipment enclosures
    - .1 Install cabinets, racks, and enclosures. Adjust location on site to align with building, fixtures, flooring. Relocate any cabinet, rack, frame or enclosure within the same room by a horizontal distance of up to 3 m from the location shown without adjustment to Contract Price.
    - .2 Install power distribution strips in cabinets.
  - .3 Communications cable management and ladder rack
    - .1 Suspend overhead cable runway at spacing of supports of 1.5 m or less; use only manufactured accessories; avoid the use of trapeze type supports; finish exposed cut ends with end caps; finish exposed rods with acorn nuts; paint all damaged areas with matching paint.
    - .2 Install cable management accessories; follow manufacturer's recommendations.
- .2 Communications Cabling
  - .1 General
    - .1 Cables and cable pathways run parallel or perpendicular to building lines.
    - .2 Avoid scraping, denting, crushing, twisting, kinking or otherwise damaging cables before, during, or after installation. Contractor to replace damaged cables without additional compensation.
    - .3 Install all cables in accordance with manufacturer's specifications ensuring that proper installation techniques are observed and that the cable maximum pull-force and minimum bend radius specifications are adhered to.
    - .4 Utilize all indicated and available cable pathways such as slots, sleeves, conduits, cable trays, ducts, raceways and furniture system channels except where otherwise noted to route cable vertically and horizontally through the building. Exercise caution when pulling cables in such pathways to avoid damage to any existing cables and follow manufacturer's maximum pull-force and minimum bend radii.
    - .5 Where cables are exposed to risk of being damaged by sharp edges of furniture, cabletray, raceway, etc., protect cables by feeding them through a length of flexible plastic conduit.

- .6 Neatly bundle, secure and wrap all cables. Use only flat, soft hook-and-loop fastening tape. Ensure cable wraps do not deform the cable jacket.
- .7 Where cables are terminated on a patch panel, bundle and dress cables in groups of twelve or twenty-four, each group consisting of cables from a single twelve or twenty-four port patch panel.
- .8 Where cables are terminated on a cross-connect field, bundle and dress cables in groups of twelve or twenty-four, each group consisting of cables from a single cross-connect panel.
- .9 Do not maintain bundles for distances greater than 1 m in cable trays.
- .10 Maintain clearances as indicated in Section 27 05 00.
- .11 Place cable only in conduits and cable tray and other designated cabling pathways. Do not place cable in crevices, cracks or other gaps in the building infrastructure not expressly intended for cabling. Do not run cables on the outside of conduits or piping or building supports or anything not intended expressly for communications cables. Use only protected cable pathways such as formed slots, formed sleeves, conduits, cable trays, ducts, raceways and furniture system channels.
- .12 Avoid scraping, denting, crushing, twisting, kinking or otherwise damaging cables before, during, or after installation. Replace damaged cables without cost to the Contract.
- .13 Pull cables in a continuous run. Do not splice horizontal cables.
- .14 Install cables in accordance with manufacturer's specifications. Ensure proper installation techniques are observed and cable maximum pull-force and minimum bend radius specifications are adhered to.
- .15 Protect cables against risk of damage at edges of furniture, cable tray, raceway, etc. Install cable in flexible plastic conduit.
- .16 Protect cable at pathway transitions by use of flexible plastic conduit or manufactured "waterfall" elements.
- .17 Neatly bundle and secure cables. Use light pressure soft wraps.
- .18 Bundle and dress cables in groups of twelve or twenty-four, at patch panels and within cabinets. Dress cables neatly and orderly within cabinets. Follow manufacturer's recommended practices to ensure performance compliance.
- .19 Support cables within cabinets at rear of patch panel and at intervals of 450 mm.
- .20 Support vertically placed cables by attaching to a support, firmly attached to the building fabric, at intervals of 600 mm.
- .21 Separate voice and data cables. Separate copper and optical fibre cables.
- .22 Maintain cable clearances as described in Section 27 05 00.
- .23 Do not maintain bundles for distances greater than 1 m in cable trays.
- .24 Pass cables at backboard terminations from behind, through holes positioned in the center of the termination mount.
- .25 Do not exceed manufacturer's recommended bending of cable. Maintain a radius of four times cable diameter or 25 mm for copper UTP or FTP or STP, whichever is the greater. Maintain a radius of ten times cable diameter or 30 mm for optical fibre cables.

- .26 Do not untwist exposed pairs at terminations for more than 13 mm.
- .27 Bond to ground all metallic cable strength members and metallic sheaths to manufacturer's specifications.
- .2 Identification
  - .1 Comply with identification instructions described in the Contract drawings or Specification.
  - .2 Apply channel identification labels at each end of cable, on faceplates, faceplate outlets, patch panel outlets, and any point of cable termination.
- .3 Copper backbone cabling
  - .1 Pull all UTP cables in a continuous run. Cable splices will not be accepted.
  - .2 Where voice and data cables are separately identified on the Contract Drawings, separate voice and data cable into distinct bundles.
  - .3 For cables being terminated on a backboard mounted cross-connect field, pass all cables behind backboard in bundles and pass them through holes positioned in the centre of the termination mount.
  - .4 For UTP cables, maintain a minimum bending radius of four times cable diameter or 25 mm whichever is the greater.
  - .5 Use vertical pipe split mesh grips to support the weight of the cable at the top of a vertical cable rise of 4 m or more.
  - .6 Use a minimum of five cable ties per floor to prevent side-to-side movement of the cable.
  - .7 Neatly bundle, wrap, secure and route all backbone cables.
  - .8 Separate backbone copper data cables, backbone copper voice cables and backbone fibre optic cables into separate bundles.
  - .9 Secure cable bundles to vertical and horizontal supports and neatly fasten to plywood backboards, cable tray or termination racks and cabinets.
  - .10 Exercise caution when pulling cables in pathways to avoid damage to any existing cabling and ensuring that the cable manufacturer's installation procedure is followed.
  - .11 Inform Consultant immediately of any backbone cable runs exceeding 800 m for UTP cable, 2000 m for multimode fibre and 3000 m for single-mode fibre.
- .4 Optical fibre backbone cabling
  - .1 Use fibre fan out kit at transition from loose tube to tight buffer.
  - .2 Apply shrink wrap to prevent gel leakage.
  - .3 Pull all optical fibre cables in a continuous run. Fibre splices will not be accepted except as a termination method.
  - .4 Follow proper installation and termination practices for optical fibre cabling. Do not kink or exceed manufacturer's restrictions on the optical fibre cable minimum bend radius.
  - .5 Maintain a minimum bending radius of ten times cable diameter or 30 mm, whichever is larger.

- .6 Splicing of fibre cables
  - .1 Splices, except those expressly for the purpose of terminating the optical fibre strands and where expressly called for on the Contract Drawings, will not be accepted except by express and written approval by Consultant.
  - .2 Splicing of the cables is permitted only in designated junction boxes, manholes, buildings and in the fibre patch panels.
  - .3 House splices in manholes, junction boxes and the remote buildings in an outdoor splice enclosure.
  - .4 House all splices in the telecommunication closets in splice trays located in or close to the fibre patch panels.
  - .5 Splice fibres using quality fusion type splicing equipment. Splicing equipment is subject to approval by the Consultant. Provide the Consultant with Specification details of the splicing equipment prior to commencing splicing.
  - .6 Remake all splices with a forward transmission loss in excess of 0.3 dB, at no cost to the Contract.
  - .7 Replace the cable or remake at no cost to the Contract, splices in any one link where the mean splice loss exceeds 0.2 dB.
  - .8 Arrange splices neatly in the support enclosure and protect with a suitable splice protector.
  - .9 Splice and terminate all fibres including spares to provide end to end links.
  - .10 Splice and connect individual fibres so that a constant identification scheme of the fibres is maintained throughout the system.
  - .11 Label all fibres in the splice tray with permanent vinyl markers. Label cables according to the identification plan as shown on the Contract Drawings.
- .5 Coaxial cable backbone cabling
  - .1 Pull all coaxial cables in a continuous run. Splices not accepted.
  - .2 Follow manufacturer's installation instructions. Do not kink or exceed manufacturer's restrictions on the cable minimum bend radius.
  - .3 Allow sufficient spare cable for working allowance at each termination.
- .3 Audio-Visual Communications Horizontal Cabling
  - .1 Comply with manufacturer's installation instructions.
- .4 Paging Communications Horizontal Cabling
  - .1 Comply with manufacturer's installation instructions.
  - .2 Comply with Division 26
- .5 Antennas Communications Horizontal Cabling
  - .1 Comply with manufacturer's installation instructions.

.6 Data Communications Horizontal Distribution Cabling

.1 Cabling

- .1 Inform Consultant immediately and prior to installation of cable of any horizontal cable pathway routes exceeding 90 m in length.
- .2 Do not strap cables to, or lay cables on, any length of conduit, pipe, ventilation duct or other building element not expressly installed for the purpose of cable support.
- .3 When determining a cable routing pathway, give priority to air handling ducts, fire sprinkler pipes and electrical conduits.
- .4 Except for cables expressly indicated as SPARE, terminate all pairs of UTP cable and all strands of fibre optic cable at both ends.
- .5 Terminate all pairs of spare UTP cable in telecommunication closet and store workstation end in ceiling space by coiling neatly and suspending. Do not rest cables on ceilings or air handling ducts.
- .6 Spare cables to be of sufficient length to permit reaching any point in the room to which they apply.
- .7 Where practicable and where the maximum allowable cable length is not exceeded, provide 3 m of slack UTP cable and 3 m of slack optical fibre cable at the workstation end of each distribution cable. Neatly coil and store slack in cable tray.
- .8 Where the telecommunications outlet is mounted on a wall box or floor box or system furniture, provide working slack allowance for UTP cable of 300 mm. Coil neatly and secure in the outlet box.
- .9 Select least obstructed pathway through modular or system furniture. Where available, use eye-level pathways in preference to base-level pathways.

.2 Terminations

- .1 Terminate cables at connectors in Work area and in telecommunications rooms.
- .2 Terminate copper backbone cables at IDC blocks or patch panels as indicated on the Contract Drawings.
- .3 Terminate optical fibre cables at patch panels or surface mount outlet assemblies as indicated on the Contract Drawings. Mount connectors or couplers or cassettes in the fibre mounting shelves or modular assemblies.
- .4 Terminate coaxial cables at device using connectors prescribed by the device connection.

.7 Communications Faceplates and Connectors (Jacks)

.1 Outlets

- .1 Install blank cover plates for all unused or abandoned outlet boxes.
- .2 Mounting heights
  - .1 Install telecommunications outlets at elevations indicated on the Contract Drawings; Measure elevations to centre line of outlet.

.2 Faceplates

- .1 Install blank filler plates for all unused modular jack positions on faceplates.

- .8 Communications Connecting Cords, Devices, and Adapters
    - .1 Turn over patch cords to Owner.
  - 3.3 **RE-INSTALLATION**
    - .1 General
      - .1 Where any part of the Work fails tests and that Work is to be built without physical discontinuity, remove the offending material and install new without increase in cost to the Contract.
      - .2 Where any part of the Work fails tests, repair the fault in a manner to prevent recurrence and re-test.
      - .3 Where any part of the Work fails tests and that Work is to be built without physical discontinuity, remove the offending material and install new without increase in cost to the Contract.
  - 3.4 **FIELD QUALITY CONTROL**
    - .1 General
      - .1 Where any part of the Work fails tests, repair the fault in a manner to prevent recurrence and re-test.
      - .2 Test backbone cables before and after installation.
      - .3 Perform pre-installation testing of Products as detailed in Section 27 08 00.
  - 3.5 **SITE TESTS, INSPECTION**
    - .1 Field Engineer Services
      - .1 Provide Field Engineer for inspection and certification of equipment during installation, testing and commissioning as required.
  - 3.6 **MANUFACTURERS' FIELD SERVICES**
    - .1 Provide manufacturer's representatives to verify installation practices for each part of the Work as may be relevant to all components including wiring and terminations.
  - 3.7 **ADJUSTING**
    - .1 Wireless Access Point Installation and Adjustment
      - .1 Adjust location of wireless access points and wireless access point assemblies by 10 m in any horizontal direction without additional cost to the Owner.
- End of Section

(THIS PAGE INTENTIONALLY LEFT BLANK)

- 1 General
- 1.1 **SUMMARY**
  - .1 Section Includes
    - .1 Labour, Products, equipment and services necessary to complete the Work of this section.
    - .2 Comply with all sections of the Contract Documents.
- 1.2 **SPECIAL INSTRUCTIONS TO BIDDERS**
  - .1 Attend one briefing session with Engineer and Owner's Representative to establish user population densities, user performance requirements and applications requiring wireless connectivity.
- 1.3 **SYSTEM DESCRIPTION**
  - .1 Comply with scope of system described in the Contract Drawings.
    - .1 Installation of surface or suspended wireless access points at each location indicated on the Contract Drawings.
    - .2 Access point enclosure to comply with requirements of location.
    - .3 Installation of network connection patch cables.
    - .4 Onsite active survey executed by manufacturer's representative to assess.
  - .2 Owner Supplied Equipment
    - .1 Access points furnished and configured by Owner. Performance parameters to Owner's Specification.
    - .2 Network switching and routing equipment for enterprise applications.
    - .3 Network switching and routing equipment for facility and building management related applications.
    - .4 VoIP routing equipment by Owner.
    - .5 Power over Ethernet midspan injection and end point power injection equipment.
- 1.4 **QUALITY ASSURANCE**
  - .1 Where any part of the Work fails tests, repair the fault in a manner to prevent recurrence and re-test.
  - .2 The Contractor shall provide a verification report to confirm data jacks and cables have been installed, terminated and tested.
- 1.5 **AREA CLASSIFICATION**
  - .1 No area in the Work is classified as hazardous.
- 2 Products
- 2.1 **MANUFACTURERS**
  - .1 Wireless Access Points and Antenna

.1 Cisco

3 Execution

3.1 **WIRELESS ACCESS POINTS**

- .1 Commission access point manufacturer to perform active site survey to determine optimum set up and configuration of multiple access points. Coordinate with Owner for user population density and traffic predictions.
- .2 Comply with installation instructions provided by the manufacturer.
- .3 Provide mechanical supports to firmly support array.
- .4 Attach supports to building fabric.
- .5 In conjunction, cooperation with and witnessed by the Engineer, perform signal strength field measurements using instrumentation recognized and approved by the manufacturer to verify that better than 90% of randomly selected locations exceed the minimum signal level required for the application as indicated in the manufacturer's published reference material.
- .6 If fewer than 90% test successfully, repeat the test.
- .7 If fewer than 90% continue to test successfully, refer to the Engineer and manufacturer for recommended recourse.
- .8 Provide mounting arrangements and install access point for up to an additional 5% of the total number of wireless access points to compensate for areas of limited coverage.
- .9 Assist Owner to set in place Owner-supplied equipment including switches, routers, and wireless access points.
- .10 Configuration of same systems by Owner.

3.2 **INTERFACE WITH OTHER WORK**

- .1 Comply with the Contract Documents.
- .2 Bestow on the Owner the right to execute work on the site before Contract completion.
  - .1 Be governed by terms of this section in circumstances where the Owner is instrumental in providing or facilitating a communications network that is a necessary part of the facility operations and maintenance Building Management System or any other communications system that is necessary for the completion of the Work.
  - .2 Other communication systems will include networks to facilitate without limitation:
    - .1 CCTV and surveillance
    - .2 Intercom
    - .3 Telephone
    - .4 Access control
    - .5 Intrusion detection

- .3 Receive, uncrate, set in place and energize network devices furnished by the Owner that are required to facilitate a working Building Management System Ethernet network.
- .4 Coordinate with Owner's technician forces to provide access to equipment and equipment spaces and to enable the configuration of network switching, routing, server and data storage equipment.
- .5 Provide the Owner's technician forces necessary networking configuration parameters that describe building systems as required for the completion of a fully operational Building Management System.
- .6 Provide reasonable protection of the Owner-provided equipment against harm or loss caused by accident or negligence.
- .7 Coordinate with the Owner and establish mutually agreed dates on desired scheduling of delivery and set up of equipment.

End of Section

(THIS PAGE INTENTIONALLY LEFT BLANK)

1 General

1.1 **SUMMARY**

.1 Section Includes

- .1 Labour, Products, equipment and services necessary to complete the Work of this section.
- .2 Common work results as laid out in Section 27 05 00.

1.2 **MANUFACTURER'S ATTENDANCE**

- .1 Provide manufacturer's representatives to verify installation practices for each part of the Work as may be relevant to all components including wiring and terminations.

1.3 **FIELD INSPECTION**

- .1 Provide field Engineer for inspection and certification of equipment during installation, testing and commissioning as required.

1.4 **QUALITY ASSURANCE**

- .1 Where any part of the Work fails tests, repair the fault in a manner to prevent recurrence and re-test.
- .2 Where any part of the Work fails tests and that Work is to be built without physical discontinuity, remove the offending material and install new without increase in cost to the Contract.

1.5 **AREA CLASSIFICATION**

- .1 No area in the Work is classified as hazardous.
- .2 Refer to all related Drawings and Specifications in the Contract Documents.

1.6 **SYSTEM DESCRIPTION**

- .1 Voice communications system using network cabling for VoIP services.
- .2 Telephone system using network cabling for baseband analog and/or TDM and/or POTS voice services.
- .3 Operating in conjunction with horizontal distribution cabling indicated on Contract Drawings and in Division 27 Specification.
- .4 System to performance specification set by Owner.
  - .1 Self contained rack mounted telephone switching unit.
  - .2 Switch to provide signal routing for extension-to-extension and extension-to-trunk. Trunk lines as required by system.
  - .3 System to operate with digital TDM desk sets and optionally configurable to VoIP desk sets on set by set basis.
  - .4 Self-contained back-up power supply to provide eight hours survival in event of loss of utility power.
  - .5 Revert to bypass mode after power supply exhausted.

- .6 Provision of two desk set units connected directly to POTS service.
- .7 Desk sets and interconnecting cables supplied and installed by Owner.
- .5 Emergency Telephone Systems
  - .1 Designated telephones connected to incoming carrier trunk services at demarcation point.
  - .2 Wall / desk mounted individual telephone set instruments directly connected to dedicated express inside wiring.
  - .3 Automatic ring down to programmed carrier assigned number.
  - .4 Wall and desk sets supplied and installed by Carrier (Bell Canada).
- .6 Access to paging and zone selection from telephone key pad and from intercom system.
- 1.7 **PAGING**
  - .1 Public paging system operating through speakers mounted within telephone desk set units.
  - .2 Distinctive tones created with following input:
    - .1 Request to enter push button at main entrance
    - .2 One hundred twenty second warning in advance of expiry of intrusion detection system set-back timer
    - .3 Sixty second warning in advance of expiry of intrusion detection system set-back timer
- 1.8 **PRODUCT VENDORS**
  - .1 Manufacturer as specified by Owner.
- 2 Products
- 2.1 **TELEPHONE SWITCH**
  - .1 As specified by Owner.
  - .2 Manufacturer
    - .1 Representative Product: Nortel BCM50
- 2.2 **TELEPHONE DESK SET**
  - .1 As specified by Owner.
    - .1 Representative Product: Nortel
- 2.3 **EMERGENCY TELEPHONES**
  - .1 Indoor or outdoor industrial analog telephone with non-locking door. Cast aluminum enclosure, corrosion resistance powder coated faceplate, volume control polycarbonate handset and stainless steel hardware material. Provide pole mounting kit as required for the application.

- .1 Acceptable Manufacturer: "ACT Series" (ACT-30 or ACT-40) by Guardian Telecom or approved equal,

3 Execution

3.1 **CARRIER SERVICES**

- .1 Cooperate with Owner and carrier to coordinate Specification and arrangement for installation of incoming trunk line carrier services.
- .2 Inform carrier of emergency telephone ring-down numbers as instructed by Owner.

3.2 **TELEPHONE SWITCH**

- .1 Set up and configuration by Owner.
- .2 Install and configure telephone switch to Owners' specification and satisfaction.

3.3 **TELEPHONE DESK SETS**

- .1 Set up and configuration by Owner.
- .2 Install and configure telephone desk sets to Owners' specification and satisfaction.

3.4 **EMERGENCY TELEPHONES**

- .1 Set up and configuration by Owner.
- .2 Install and configure telephone switch to Owners' specification and satisfaction.
- .3 Telephone to be connected within 15,000 ft. (~4,600 meters) of a main telephone switch in order to maintain voice quality.

End of Section

(THIS PAGE INTENTIONALLY LEFT BLANK)

1 General

1.1 **SUMMARY**

.1 Section Includes

.1 Labour, Products, equipment and services necessary to complete the Work of this section.

.2 This section describes a portion of the Contract scope of Work. Refer to all related Drawings and Specifications in the Contract Documents for the full description of the Contract scope of Work.

1.2 **GENERAL REQUIREMENTS**

.1 Provide all components indicated on the Contract Drawings including but not limited to supports, bollards, conduits, raceways, device boxes, enclosures, cable, wires, connectors, equipment, controls, devices, controllers, master stations and substations, relays, interfaces, programming and whatever else in order to provide a completely installed and satisfactorily operating intercommunication system as indicated in the Contract Drawings.

.2 Include where applicable and without limitation, electronic switching systems, wiring, wiring conduit and raceways, cabling supports, terminal devices, terminal supporting enclosures, terminal supporting bollards, interfaces to and from other systems as further described and indicated by and in compliance with this Specification and the Contract Drawings.

.3 Confirm that the system specified herein has the capability to meet the design intent, or propose an alternative system, either fully or in part.

.4 Provide any other equipment, labour or material necessary to fulfill the functional and performance criteria of the system whether shown in the Specification or Contract Drawings or not.

1.3 **TERMS OF REFERENCE**

.1 Dimensions and Quantities

.1 Dimensions shown on Drawings are approximate. Verify dimensions by reference to Shop Drawings and field measurement.

.2 Quantities or lengths indicated in any of the Contract Documents are approximate only and are not to gauge or limit the Work.

.3 Install systems indicated as continuous on the Contract Drawings without break or interruption. Ensure electrical continuity between metallic components shown as connected.

.4 Make necessary changes to routing of cables and the like to accommodate structural, mechanical, electrical and architectural conditions. Coordinate with other trades and make allowance for conditions that will arise from work in progress under separate contract.

.2 Area Classification

.1 No area in the Work is classified as hazardous.

.3 Submissions

- .1 Submit Product data and Shop Drawings in accordance with the Contract Specification.
- .2 At time of tender submit a complete list of all components.
- .3 At time of tender submit a time schedule indicating significant milestones. Within five days of Contract Award submit a revised time schedule

.4 Manufacturer's Attendance

- .1 Provide manufacturer's representatives to verify installation practices for each part of the Work as may be relevant to all components including wiring and terminations.

.5 Field Inspection

- .1 Provide field Engineer for inspection and certification of equipment during installation, testing and commissioning as required.

.6 Quality Assurance

- .1 These Specifications supplement the Electrical and Electronic Manufacturers Association of Canada, Canadian Standards Association Standards, Electronic Industries Association, Telecommunications Industries Association standards and recommendations. Conditions of the EEMAC, CSA, EIA, TIA and ISO/IEC standards and recommendations apply unless superseded or modified by this Specification.
- .2 System compliant with FCC Part 15 Sub Part J approval as accredited by National Bureau of Standards for Emissions and Telecommunications Testing or by other approved and recognized authority.
- .3 Where requirements of the Specifications exceed referenced standards, the Specifications apply. Where standards differ between authorities, the most stringent applies.
- .4 Immediately bring to the attention of the Consultant any requirements of the Specifications that are substandard to referenced standards.
- .5 Avoid using equipment not acceptable to electrical inspection authorities.
- .6 Where any part of the Work fails tests, repair the fault in a manner to prevent recurrence and re-test.
- .7 Where any part of the Work fails tests and that Work is to be built without physical discontinuity, remove the offending material and install new without increase in cost to the Contract.

1.4 **SUBMITTALS**

- .1 Comply with submission procedures described in the Specifications Section 01 33 00.
- .2 Comply with use and terms of use of Project Web.
- .3 Shop Drawings

- .1 Submit Shop Drawings for Consultant's review of all component types prior to commencing use of said components. Avoid the use of components for which Shop Drawings have not been issued.
- .2 Include where applicable:
  - .1 Plan and front elevation of equipment layouts prior to assembling said equipment.
  - .2 Room plan and elevation layouts where different from Contract Drawings.
  - .3 Identification scheme prior to use of said component.
- .3 Submit functional and wiring diagrams for review showing all interconnections and equipment layouts within the systems and between systems before commencing applicable installation work.
- .4 Review all Shop Drawings before submitting to Consultant for review for clarity of print and clarity of identification of Products.
- .5 The review of the Shop Drawings by the Consultant or Owner's Representative does not relieve the Contractor of the responsibility to provide a complete and working system, based on the intent outlined in these documents.
- .4 Operation and Maintenance Data
  - .1 Submit Operations and Maintenance Manuals on completion of the Work.
  - .2 Operating and Maintenance Manuals
    - .1 Assemble and submit Maintenance Manuals in accordance with the Contract Specification.
    - .2 Prepare and supply not fewer than six bound copies of a manual incorporating:
      - .1 System block diagrams and functional schematics.
      - .2 Schematic diagrams of all equipment and devices.
      - .3 Complete "as built" wiring diagram showing all device wiring and the connections, including colour codes, cable numbering and terminal numbering.
      - .4 Operating instructions for all supplied equipment.
      - .5 Service manuals for all supplied equipment.
      - .6 Description of system operation.
      - .7 Parts list, using component identification numbers standard to electronics industry noting address, telephone number and contact name of available Suppliers.
    - .3 Submit manuals, including as-built documents, before submitting request to Owner for final acceptance of the system

.3 "As Built" Record Drawings

- .1 Identify all device locations and wiring and their connections, including colour codes, cable numbering and terminal numbering.
- .2 Where wiring is underground or under floor or below finished grade, furnish field dimension with respect to building column lines and inverts with respect to finished floor levels or grades.
- .3 Prepare drawings clearly identifying cabling pathways where the cable is not supported along its length by raceway.

1.5 **DESCRIPTION OF SYSTEM**

- .1 Provide a system of scope and capacity as indicated in the Contract Drawings.
- .2 Not all systems described herein necessarily apply to the Contract. Ensure the parameters of the systems indicated on the Drawings govern the Products, scale and features installed. Select the appropriate system or systems from the following:
  - .1 Large scale system
  - .2 Medium scale system
  - .3 Medium scale system with security integration
  - .4 Small scale systems

1.6 **LARGE SCALE SYSTEM**

- .1 System not specified.

1.7 **MEDIUM SCALE SYSTEM**

- .1 System not specified.

1.8 **SMALL SCALE SYSTEM**

- .1 Sub-section applies to systems defined as follows:
  - .1 Fewer than twenty stations.
  - .2 System not requiring features specified elsewhere in Specification.
- .2 Intercommunications system consisting of the following components:
  - .1 Inside wall mounted (flush or surface mount depending on wall type) intercom terminal station. "Hands free" operation with integrated camera, speaker, LED indicator, magnetic hearing loop.
  - .2 External mushroom push button connected to auxiliary contact to engage intercom terminal station
  - .3 IP addressable Desk Mounted Master station with video touch screen, camera, speaker.
  - .4 Wall mounted inside enclosure boxes for intercom terminals located in unfinished areas of the premises as indicated.

- .3 Intercommunications system providing the following features and characteristics:
  - .1 Two-way voice communication.
  - .2 "Hands free" mode of operation.
  - .3 Identical wiring requirements between stations.
  - .4 Every master able to call every other station in the system including other master stations.
  - .5 Programmable for pushbutton selection of called station.
  - .6 Programming stored in a non-volatile, battery backed RAM.
  - .7 Battery back-up for autonomous operation without loss of features for one hour without external power.
- .4 System Characteristics
  - .1 Master station to other station calls placed by selecting individual station button(s).
  - .2 Ability to establish connections between stations by receiving signals created by external computer based control system.
  - .3 Ability to electronically transmit information on status of intercom system, including connected and communicating devices from intercom system to computer based control systems including CCTV controllers and access control systems.
  - .4 Connection completion indication by audible tone at the calling and the called stations to signify completion of the connection without manipulation of controls.
  - .5 Connection cancelled at master.
  - .6 Facility for hands free or handset modes in master unit; local loud-speaker disabled when unit is in handset mode.
  - .7 Single digit and/or single button speed calling individually programmable at each station.
  - .8 Display of calling party's identification number and/or alphanumeric identification or other means of identification of calling party or station at master.
  - .9 Master stations equipped with local MUTE.
- .5 Integration with Security Systems
  - .1 Security system to log time of event, door identification number, and action taken.

#### 1.9 **CARE, OPERATION AND START-UP**

- .1 Provide instruction and demonstrate the use of the system to the Owner in three scheduled training sessions.
- .2 Provide manufacturer's factory trained service Engineers to instruct:
  - .1 Maintenance personnel in maintenance of system.

- .2 Operating personnel in the use of system.

#### 1.10 **RELATED WORK**

- .1 Extra low voltage wiring conductors and connections for intercom system as necessary to create a fully operative and functional system.
- .2 Conduits and electrical raceways to create a continuous electrical pathway from intercom terminals to within 900 of cable terminations in equipment room.

#### 2 **Products**

##### 2.1 **GENERAL**

- .1 Use equipment produced by a manufacturer with a minimum five year period of experience producing similar products and who can refer to similar installations now rendering satisfactory service.
- .2 Equipment of modular design and solid state devices except for electro-mechanical components.
- .3 Reference to model numbers and other information is intended to establish the standards of performance, quality, and appearance which must be met. Where Products are identified by named manufacturers on the Contract Drawings, provide Products manufactured by the named manufacturers.
- .4 Guarantee equipment to be free from defective material and workmanship for a period of one year from date of final acceptance by Owner, except where damage is caused by Owner through accident, abuse, improper operation or neglect. Provide maintenance, pursuant to this guarantee during normal working hours at no expense to the Owner.
- .5 Provide satisfactory evidence of the maintenance of a service organization capable of furnishing adequate inspection and service to the equipment and be prepared to offer a Service Contract for maintenance of the system after guarantee period.

##### 2.2 **CABLING**

- .1 Comply with Sections 27 05 00 and Appendix E City of Toronto Cabling Standards.
- .2 Supply and install cabling of a type and style required by the original equipment manufacturers so that the system may operate to the best of its published performance specifications.
- .3 Supply and install conduit and electrical raceways for exclusive use by intercommunication systems.

##### 2.3 **INTERCOM SWITCHING SYSTEM – LARGE SCALE**

- .1 System not specified.

##### 2.4 **INTERCOM SYSTEM – SMALL SCALE**

- .1 Inside master: Aiphone IX-MV7-HBLA or equivalent.

##### 2.5 **INTERCOM TERMINAL DEVICES**

- .1 Devices suitable for operation with intercom switching system as indicated on the Contract Drawings. Not all devices listed below are compatible with all intercom switching systems. Select devices according to performance and systems compatibilities.

- .2 Wall Mounted Station – Inside
  - .1 Brushed metal faceplate, loudspeaker, integrated microphone.
  - .2 Metal back-box for flush wall mounting.
  - .3 Black plastic housing or metal back-box for surface wall mounting.
  - .4 Push to talk transparent button with backlight.
  - .5 Adjustable volume control with adaptive mode.
  - .6 Video Camera
  - .7 Induction Hearing Loop
  - .8 12V power supply, 24 volts DC
  - .9 Operating temperature -40°C to 60°C (-40°F to 140°F), 10%-95% relative humidity.
  - .10 Re Product – Substations
    - .1 Aiphone IX-DVFL
      - .1 Approximate dimensions 300 mm x 150 mm x 52 mm
    - .2 2N IP Solo c/w Induction Loop (to be used in Police Buildings)
      - .1 107 mm x 130 mm x 28 mm (surface mounted)
      - .2 130 mm x 153 mm x 5 mm (flush mounted)
- 3 Execution
  - 3.1 **LOCATION**
    - .1 Install intercom switching equipment in the main computer equipment room or as indicated.
    - .2 Verify site conditions before commencing Work. Install bollards in positions indicated.
  - 3.2 **INSTALLATION**
    - .1 Install equipment in accordance with manufacturer's instructions.
    - .2 Install cable in conduit or electrical raceway. Do not use open or unsupported cabling. Use flexible conduit to enclosed link to exposed device.
    - .3 Make splices using insulated crimp type sleeves. Make connections to devices having screw terminals with suitable lugs crimped to ends of conductors. Avoid the use of field soldered connections.
    - .4 Provide identification for wiring at outlet boxes and at accessible locations. Abide by the identification conventions as indicated in the Contract; make particular reference to Division 27 Specifications including Section 27 05 53.
    - .5 Exercise care during installation to avoid damage to cables and equipment. Replace equipment damaged or marred during installation.

- .6 Permanently and clearly mark in a descriptive manner all switches, connectors, jacks, receptacles, outlets, terminal blocks and cable terminals if not already required by other parts of this Specification.
- .7 Take the necessary precautions to prevent and guard against electro-magnetic and electrostatic hum, to supply adequate ventilation, and to install equipment so as to provide safety for the operator.
- .8 Observe current standards for connecting the shield drain wire of shielded signal cables. Insulate cable shields at their terminated ends with sleeves or heat shrinkable tubing. Protect shield drain wires exiting from cable jacket by PVC or Teflon tubing.
- .9 Connect all audio grounds in the equipment rack to a common point on the rack. Connect the rack to the isolated ground bus bar provided.
- .10 Install power wiring to electrically operated devices. Make electrical connections.

### 3.3 **INTEGRATION**

- .1 Program intercommunications system to send and receive signals to and from other systems as indicated.
- .2 Provide necessary wiring and connections and make signals available to other systems to enable inter-system communications.

### 3.4 **TESTS**

- .1 Test entire system after completion of installation in accordance with Owner's requirements. Submit a test report to the Consultant.
- .2 Verify that all equipment is properly installed and secured in place and ensure that all warning labels, covers, etc. are in place. Verify that all wiring is complete and free of all hazards and unintentional shorts. Ensure that all grounding is complete.

### 3.5 **TRAINING**

- .1 Provide training to the Owner's personnel.

End of Section

1 **SCOPE OF WORK AND ASSOCIATED DELIVERABLE**

- .1 The Successful Bidder shall provide Project Management, design and coordination of all Work on the systems within this contract, and maintain all required communications between various City of Toronto divisions and third party service providers.
- .2 The Successful Bidder shall be the single point of contact and shall be responsible for all coordination of Work that pertains to the Systems, along with all required coordination and communications between Personnel and the City.
- .3 The Successful Bidder shall be in good standing with all manufacturers referenced in this this document (including but not limited to American Dynamics, Dedicated Micros, Milestones and Axis) and must have and maintain all up to date certifications.

2 **LITERATURE**

- .1 Bidders, where applicable, should submit complete literature on all products being included in their quotation including, but not limited to, standard manufacturer's warranty, model numbers, part numbers and other relevant documentation as part of their Quotation.

3 **BIDDER QUALIFICATIONS**

- .1 Bidders must be authorized sellers or resellers for the products listed section 35 Manufactures List and must hold title to any equipment that will be installed or removed. if requested by the city, bidders must submit written verification of current and valid authorization, satisfactory to the city, prior to award. failure to submit written verification of authorization, satisfactory to the city within a time frame specified by the city will result in the quotation being declared non-compliant.
- .2 Prior to award, if requested by the City, the Bidder must submit written verification that their technicians are certified and authorized to undertake the installation and delivery services described in this document. Failure to submit written verification of certification / authorization satisfactory to the City within a timeframe specified by the City will result in the Quotation being declared Non-Compliant.

Bidders must provide within five (5) business days of such a request, a copy of each person's resume and certifications for proof of meeting the requirements listed in each Mandatory Criteria. Failure to provide this information within the timeframe specified, will result in non-compliance and the Bidder's Quotation will not be considered further.

- .3 All Certificates must be valid at the time of submission and throughout the duration of this contract.

.4 **Mandatory Criteria 1:**

- .1 Bidders must maintain personal with the minimum years' experience Personnel as indicated that meet the mandatory criteria in Table 1 below

**Table 1**

Item Number	Years of Experience	Certification and or Training on the following systems
<b>CCTV</b>		
1.1	3	Milestone Certified Design Engineer
1.2	3	Milestone Certified Integration Technician

1.3	3	BriefCam
	3	Victor and VideoEdge Advance Installer
<b>DSC</b>		
1.4	3	Power Series 1864 System
1.5	3	DSC Power Neo Alarm Panels
<b>ACS</b>		
1.6	3	Visonic – PowerMaster 10/30
1.7	3	Key Tracer
1.8	3	Software House - CCURE 9000 Level 2

.2 During the Term of the Contract, the Successful Bidder may substitute Personnel due to staff changes with Personnel of equal or greater qualifications and experience. Any change of Personnel shall be approved by the City prior to the substitution taking place.

- .1 All systems components and installation shall conform to the following standards and codes where appropriate:
- .2 Manufacturing: ISO 9003
- .3 Design: MIL 275E
- .4 Communications: IEEE RS232C and RS485
- .5 EMI emissions: FCC part 15
- .6 Electrostatic immunity: IEC 801.2 level 4
- .7 AC transients UL 964
- .8 National Building Code
- .9 Ontario Fire Code
- .10 Electrical Standards Authority
- .11 Process Control System Implementation Manual
- .12 NFPA 730 & 731
- .13 ULC 319/S304
- .14 UL 1981 Central Station Automation System
- .15 UL 681 Installation and Classification of Burglar and Hold up Alarm Systems
- .16 UL1635 Digital Alarm Communicator System Units

#### 4 **SECURITY CLEARANCE REQUIREMENTS**

- .1 A Clearance Letter from Toronto Police Service is a formal document produced on secure paper indicating that the subject of the inquiry has no criminal convictions in the National

Repository of Criminal Records, which is maintained by the RCMP. The Successful Bidder shall provide within fifteen (15) business days after contract award to the Project Manager, a Police "Clearance Letter", obtained within the past three (3) months for each person (including Subcontractors), that may be expected and/or will be performing Work under this contract.

- .2 The Successful Bidder's employees (including Subcontractors) that may be expected and/or will be performing Work under this contract shall not pose a foreseeable security concern or hazard to the City as it relates to the protection of its assets.
- .3 Unless authorized in writing by the Project Manager, only Personnel that provided a Clearance Letter to the Project Manager shall be permitted to Work under this contract.
- .4 The Successful Bidder shall provide an original recent (obtained within the past 3 months) Clearance Letter only. No copies will be accepted.
- .5 The cost for each of the Clearance Letters shall be the complete responsibility of the Successful Bidder.
- .6 Refer to the Supplementary Forms and Policies section.

## 5 **SPECIFICATIONS**

### 5.1 **Meeting:**

- .1 A kick-off meeting will be scheduled by the Project Manager with the Successful Bidder upon award to review the roles and responsibilities of the City and the Successful Bidder.
- .2 the Successful Bidder and their qualified Personnel (including Subcontractors) assigned to this contract shall attend the kick-off meeting if requested by the Project Manager.
- .3 The Successful Bidder's Project Coordinator (or designate) shall be responsible to coordinate, plan and schedule as many subsequent meetings as necessary throughout the Term of the contract to ensure effective project stakeholder communication.
- .4 All meetings shall be held within the City of Toronto. The Successful Bidder is responsible for all costs for consultation and project/subsequent meetings.
- .5 The City reserves the right to request subsequent meetings on-demand or on short notice and may change or cancel meetings at the discretion of the Project Manager and at no cost to the City.

### 5.2 **Resource Commitments:**

- .1 The Successful Bidder is the Design/Builder on Record and must continue to meet all of the requirements of Systems certifications and qualifications with respect to training and staffing competency, at the sole expense of the Successful Bidder, throughout the Term of the Contract, for all of the systems and components installed and in use at the facilities.
- .2 The Successful Bidder must continue to meet all of the mandatory conditions of the Warranty throughout the Term of the contract and Warranty periods.
- .3 The Successful Bidder must be able to provide the necessary materials, tools, machinery and supplies to carry out all approved Work. These resources must be available at the sole responsibility of the Successful Bidder on a dedicated basis throughout the term of the contract, to coordinate and carry out all approved Work with due care, skill and efficiency. The City may request removal and replacement within five (5) calendar days of any Contract Leads at any time throughout the duration of the contract.

- .4 The Successful Bidder must guarantee to the City that their Services and performance, including those of the Subcontractor, shall be provided in a professional, good, workmanlike manner and comply with, but not be limited to the City's City-Wide Security Policy, Workplace Violence Policy and the City of Toronto's Security Video Surveillance Policy. Those deemed not complying, at the discretion of the City, will be removed from the site and all future projects for the duration of this contract. The Successful Bidder will be provided three (3) notices of non-compliance and then be in breach of this contract, which may include contract termination as per the City of Toronto policy and guidelines.
- .5 Only Personnel listed and registered with the City will be permitted to access and Work on City of Toronto sites.

5.3 **Cleaning:**

- .1 The Successful Bidder must maintain the worksite, grounds, and building free from accumulations of waste material and rubbish, and provide on-site containers for collection of waste materials and rubbish as required. On site storage areas must be coordinated through and arranged by the City. Cleaning and disposal operations must comply with local ordinances and anti-pollution laws.
- .2 The Successful Bidder must clean dust and water residue from core drilling, cutting and patching of masonry, and drywall to satisfaction of the City. Furnishings, floors and finishes must be protected prior to the commencement of Work.
- .3 Promptly as Work proceeds, and upon completion, the Successful Bidder and each of its Subcontractors shall clean up and remove from the premises all rubbish, dirt, dust, debris and surplus materials resulting from the Work.
- .4 The Successful Bidder must at all times be considerate of site security and ensure all worksites are maintained accordingly.

5.4 **Cosmetics, Protection, and Finishes:**

- .1 The same tamper proof screws and fasteners shall be used on all equipment, enclosures, cabinets and materials in public areas. Corporate Security shall be provided two sets of tools (at no charge) which are required to service security equipment that have tamper proof screws and fasteners.
- .2 Finishes and graphics for all equipment in public areas shall be submitted to, and approved by the City.
- .3 The Successful Bidder shall be responsible for all cutting, core drilling, and patching required for the installation of this Work. Where alterations occur or new and existing Work is required, the Successful Bidder shall join, cut, remove, patch, repair, or finish the adjacent surfaces as required to meet same or better quality at no extra costs to the City.
- .4 Any Work likely to alter or detract from the original appearance must not commence without the City's written consent. Changes or alterations, completed without the City's consent, may be subject to restoration by the Successful Bidder. Any additional repairs required, due to unapproved Work, may be billed to the Successful Bidder for payment.
- .5 The Successful Bidder shall protect existing furnishings by providing and maintaining adequate temporary protective coverings.
- .6 The Successful Bidder shall provide and maintain adequate fire safety in accordance with applicable fire code and Regulations.
- .7 The Successful Bidder shall be responsible for any damage to existing structure or contents arising from a lack of adequate protection.

- .8 All Work shall be performed by a qualified and skilled trade's people as defined by the Occupational Health and Safety Act, Regulation 213/91 and all finishing shall be of the highest quality. Construction and finishing techniques must preserve the original appearance of the affected areas.
- .9 Unless authorized in writing by the City, the Successful Bidder shall not post/affix any stickers, labels, signs, logos, or any kind of promotional or advertising material on any equipment or instruments, nor at any City of Toronto site. This includes decals warning of systems in use or Services provided.
- .10 All materials, accessories, special equipment, services, personnel, test equipment and tools required for installation of the equipment shall be provided by the Successful Bidder.

**5.5 Codes, Permits, Fees and Inspection:**

- .1 All system components shall be installed according to manufacturer's instructions and in a professional manner. Workmanship and care must encompass all aspects of the task being performed so the full intent of the project may be realized.
- .2 All Work shall be performed in compliance with all applicable Regulations, Building Codes and Local By-laws.
- .3 The Successful Bidder shall be responsible for all work and material including, but not limited to surveying, scanning, soil sampling, stamped engineered drawings, cutting, core drilling, patching, trenching, excavating, temporary storage of material, laying of conduits and backfilling for the installation of assigned Work.
- .4 The Successful Bidder shall arrange for inspection of all Work by the authorities having jurisdiction over the Work. The Successful Bidder shall comply with the requirements of the authorities, federal, provincial and municipal Codes, and all other authorities having jurisdiction. These Codes and Regulations constitute an integral part of these specifications. In case of conflict, the applicable Code takes precedence over this document.
- .5 All Work shall be executed to the approval of the City. When the Work is reported to be complete, an inspection shall be made by the City, and all deficiencies found shall be corrected by the Successful Bidder within 30 calendar days of reporting the deficiency, and before the final payment is made.
- .6 The City may appoint and pay for an independent consultant to inspect the Work or to carry out specific tests as the Work progresses. The Successful Bidder shall notify the City and the consultant at least three calendar days prior to starting the Work, and shall provide any assistance that the consultant may require to carry out his/her inspections or tests at no additional cost to the City.
- .7 The consultant, if any, shall act on behalf of the City to ensure that the performance of the Work is carried out according to the specification, drawings and acceptable standard practice. The Successful Bidder shall co-operate with the consultant and shall comply with his/her directions in making good all deficiencies and defects, and in ensuring the proper execution of the Work.
- .8 The verification or acceptance of the Work by the consultant or the City does not relieve the Successful Bidder of his/her responsibility to comply with the specifications. Any Work subsequently discovered, which does not comply with the specifications shall be rectified by the Successful Bidder at no cost to the City.

**5.6 Daily Check In/Out:**

- .1 Before Work commences, the Successful Bidder shall have already incorporated all site and facility constraints as it relates to on site access time and Work performance limitations.
- .2 Before commencing Work and prior to completion of any Work, the Successful Bidder's Personnel must check-in and out daily with the City of Toronto Security Control Centre at 416- 397-0000, and if available with on-site Security.
- .3 Upon check-in and check-out, the Successful Bidder's Personnel shall clearly explain what effects their Work will have on current security systems or VSS that are being monitored, and they shall identify any anticipated alarm signals, as well as any system functional limitations.

**5.7 Disruptions to City Operations:**

- .1 Careful consideration must be given at all times to the function of the facility and the persons contained. The Successful Bidder must make all attempts to cause as little disruption in service as possible when providing installation services. Work that may cause any type of major disruption to building operations and/or building occupants must first be cleared by the City, and may have to be completed after hours.
- .2 The Successful Bidder shall co-ordinate all Work with the City's representative to ensure minimum disruption of service.
- .3 Work shall be executed to minimize the impact or the disruption of the existing operational systems and City of Toronto facility operations. At any time during the performance of the Work, if the existing, operational systems are affected beyond the expectation approved through the Implementation Plan or there is an imminent danger to be affected beyond the approved expectation, the Successful Bidder shall stop Work and minimize the impact on the operational systems. The Successful Bidder shall immediately inform a City of Toronto Corporate Security representative. The Successful Bidder shall perform all Work to implement a temporary solution to enable 100% functionality for operational systems. The Successful Bidder is to proceed with permanent Work only after a solution is approved by City of Toronto Corporate Security.

**5.8 Impact on City of Toronto Operation:**

- .1 Operational restrictions may affect the scheduling of Work and may require some activities to be scheduled at night, during weekends, or during periods when facilities are not in service.
- .2 The Successful Bidder shall perform the Work in a manner to prevent disruption of normal City of Toronto operations. Any task that may cause disruption of operations shall be approved in advance by City of Toronto Corporate Security.

**5.9 Inspection of Work:**

- .1 City of Toronto Corporate Security reserves the right to inspect any and all Work and reserves the right to be present during the performance of any Work under this Contract.
- .2 City of Toronto Corporate Security will perform periodical and statistical inspections of the Work. The Successful Bidder shall provide and facilitate access to Work for inspection.
- .3 The Successful Bidder shall correct within a maximum of one week (7 calendar days) any Work deemed not satisfactory by the City of Toronto.
- .4 In the event that the Successful Bidder does not correct the Work within the time frame specified, the City reserves the right to have the Work completed by another qualified firm at the Successful Bidders expense.

5.10 **Occupancy Before Completion:**

- .1 The City may use portions of the Work although the same may not be entirely complete without claim of any kind by the Successful Bidder so doing, nor shall any such use relieve the Successful bidder from his/her obligation under this contract until the termination of the guarantee/Warranty period.

5.11 **Monitoring/Programming:**

- .1 Many of the inspected devices require confirmation of device annunciation on the monitoring screen. Personnel must arrange/coordinate with the Corporate Security Lead to change a given device's armed, controlled or online status. Personnel must ensure the previous state is restored upon completion of the inspection testing.

5.12 **Equipment, Placement, Relocation, Removal, or Expansion**

- .1 Some existing hardware may require removal or relocation for installation of new devices. In each instance, the Successful Bidder must advise Corporate Security, and the Successful Bidder must receive written approval prior to the removal or relocation. All costs associated with the removal or relocation are the sole responsibility of the Successful Bidder.
- .2 All placements of security devices are subject to approval by Corporate Security before final acceptance is granted.
- .3 All equipment and devices, removed by the Successful Bidder for replacement or placement of a new security device, shall remain the property of the City and shall be submitted to the City upon device removal.

5.13 **Design and Installation:**

- .1 The Successful Bidder is responsible to provide a fully functional system meeting the City's standards as required by this document.
- .2 The Successful Bidder shall be the design builder required to supply and/or install fully functional integrated, Security System for the City of Toronto. The Successful Bidder shall be solely responsible for its design errors or omissions. Including, but not limited to situations where all the necessary materials to deliver a fully functional integrated CCTV and AV system have been missed. This clause shall not apply where the City requests a change to the original design request. The Successful Bidder shall be solely responsible for detailed design, project management, coordination, equipment procurement, installation, component wiring, terminations, connections, labelling, programming, integration, testing, commissioning and as- built drawings of all Systems.
- .3 The Successful Bidder shall supply and/or install all required Systems electronic equipment, hardware, software, licenses and connections, to allow for City required functionality under this document.
- .4 The systems shall consist of field, infrastructure, and monitoring devices integrated to the access control and intercom systems necessary to provide a fully automated system to control authorized traffic in and out of controlled areas of City facilities.
- .5 The system shall be designed on a distributed processing architecture employing remote DGPs (Data Gathering Points) and operator workstations connected through TCP/IP and/or serial communication protocols, where applicable.
- .6 As part of this document the Successful Bidder shall connect all devices to centrally located patch Panels and/or equipment located in communication rooms and /or DGP as detailed in the specification drawings and standards.

- .7 Connectivity from the IP equipment shall be based on Ethernet IP based protocols over a City supplied network, which shall connect and be programmed to servers and remote client workstations.
- .8 The Successful Bidder shall provide all programming data required to achieve the specified functionality (this includes situations where existing technology is being replaced with new technology). Such programming shall include (but is not limited to) programming of all alarms, events, triggers, timers, objects transmitting and receiving signals and interfaces as well as programming of signal receiving centre equipment to provide 100% full functionality.
- .9 Any required expansion boards/nodes and ancillary equipment needed for a full operation of the system are the responsibility of the Successful Bidder.
- .10 The Successful Bidder shall provide power supplies with battery back-up to meet NFPA 731 standards for all Systems. Failure to meet the standard will result in the Successful Bidder providing all supplies necessary at no additional cost to the City.
- .11 The Successful Bidder shall be required to populate all items such as parts and equipment from supply and install projects into a City supplied Microsoft Office database file. Upon review and approval by the City, these database files will be imported into the City central physical asset and material management database.
- .12 The Successful Bidder is responsible for all final wiring and terminations of all Systems.
- .13 The Successful Bidder shall be responsible for ensuring all structured cabling and electrical including back boxes, cabling, conduit, troughs and raceways meet equipment electrical and wiring requirements throughout all phases of the project.
- .14 The Successful Bidder shall inspect conduit, cabling, back boxes, junction boxes associated with the Systems during installation and shall notify the City Project Manager of any issues found.
- .15 The Successful Bidder shall maintain integration to existing security systems to the maximum level supported by the systems manufacturers.
- .16 Test and commission according to the 32.0 Compliance with Standards.
- .17 The Successful Bidder shall review the current site conditions and existing system configurations.
- .18 The Successful Bidder shall provide at all times sufficient competent labour, materials, and equipment to properly carry on its Work and ensure completion of each part in accordance with the Work schedule and within the contractual time period.
- .19 All installation materials, accessories and special equipment, Services, Personnel, test equipment and tools required for installation of the equipment shall be provided by the Successful Bidder.
- .20 Equipment shall be installed as per the manufacturer's recommendations, programmed and integrated to City Standards and the City Project Manager.
- .21 The Successful Bidder shall secure and be responsible for the safe keeping and protection of the system equipment until the system is fully accepted by the City of Toronto after the commissioning process.
- .22 The Successful Bidder shall coordinate all network provisioning with City of Toronto IT Services.

- .23 The Successful Bidder shall start to warrant the Systems, warranty start date, when all deliverables such as as-builts of the project have been accepted by the City and deficiencies corrected.
- .24 The Successful Bidder shall maintain the System in compliance with manufacturer's specified Preventative Maintenance schedule during the project installation period.
- .25 The Successful Bidder is responsible for all System decommissioning and removal of equipment in this document, at no additional cost to the City. Including all cable removal as per ESA requirements.
- .26 The Successful Bidder shall be responsible to investigate, design and integrate to new and existing Systems.
- .27 It is the responsibility of Successful Bidder to design and finalize the System wiring diagrams, drawings, documentation and schedules in order to meet site specific conditions and provide a fully functional system.
- .28 Integration and Analytic programming for items not listed in the contract are to be shown as separate line items in quote indicating the type of integration and/or analytic to be achieved and used for the remainder of the contract term.

## 6 **SUPPLY AND INSTALLATION PROJECT SUBMISSION REQUIREMENTS**

- .1 The Successful Bidder shall (at no additional charge) submit to the Project Manager one (1) set of electronic copies of the following: project quotation, detailed project schedule, shop drawings, as-builts, warranty, and any other related supporting documents as detailed in this document.
- .2 All electronic documents submitted to COT must be named by purchase order, site name, document type, date, and Service Request Portal Number.
- .3 As directed by Toronto City Council in 2005 under the City's Waste Diversion Plan, where feasible and appropriate, all hardcopy prints will be double sided. Therefore the Successful Bidder will be required to comply with this plan as it relates to all hardcopy print contract documents.

## 7 **DETAILED PROJECT SCHEDULE**

- .1 Detailed Project Schedules are to be free from error and submitted.
- .2 The detailed project schedule shall include, but not be limited to the following information:
  - .1 Commencement date for each major activity;
  - .2 The duration of each activity;
  - .3 The proposed sequence of activities;
  - .4 Dependencies between internal activities and milestone;
  - .5 Dependencies between external activities and milestone; and,
- .3 The schedule shall be progressively updated as the project progresses, which enables the Project Manager to readily identify activities by location and resources.
- .4 The schedule information shall be sufficiently detailed to enable integration of all interface activities by the Project Manager.

- .5 The schedule shall be presented in daily segments and shall include the following at a minimum:
  - .1 Site surveys (as required);
  - .2 Service Request Portal Number;
  - .3 Submission and approval of Shop drawings;
  - .4 Shipping confirmation date;
  - .5 Material delivery and installation;
  - .6 Conduit and wire pulls completed;
  - .7 Progress photographs (only of concealed work);
  - .8 Panels and power supplies installed and programmed;
  - .9 Field equipment terminated, mounted and tested;
  - .10 Security testing complete;
  - .11 Acceptance testing complete;
  - .12 As-built documents;
  - .13 Equipment integration and dry-run;
  - .14 Monitoring period (minimum one week);
  - .15 Commissioning and hand-over.
- .6 The schedule shall be clearly identified with the following:
  - .1 Site name, if applicable and address;
  - .2 CRO number;
  - .3 Start date of the project with time;
  - .4 Project Coordinator name with detailed contact information; and,
  - .5 Subcontractor name; and
  - .6 Project completion date.
- .7 Distribute copies of any revised schedule to:
  - .1 Project Manager; and,
  - .2 Security Project Lead
  - .3 Other Stakeholders as indicated by the Project Manager.
- .8 The Successful Bidder shall be responsible for any delay in the progress of the Work, and it being understood that no such delay shall be an "Excusable Delay" for the purposes of extending the time for performance for the Work or entitling the Successful Bidder to additional compensation. The Successful Bidder shall take all necessary steps to avoid delay in the final completion of the Work without additional cost to the City of Toronto. The City shall not be responsible for any expense or liability resulting from any such delay.

**8 SHOP DRAWINGS**

- .1 Shop drawings prepared are to be free from error and submitted in electronic format. Shop drawings are to include all items quoted with no substitutions without the prior consent of the City Project Manager. All documents produced shall be the property of the City of Toronto and the Successful Bidder shall have no rights over the entire documentation package or any parts of the documentation package.
- .2 Shop Drawings shall include:
  - .1 Date and revision number;
  - .2 Project title and number;
  - .3 Service Request Portal Number;
  - .4 Contract Drawing / Specification Reference;
  - .5 Name and address of:
    - .1 Subcontractor;
    - .2 Supplier, Manufacturer; and,
  - .6 Wiring diagrams for each location (including distances);
  - .7 Details of types of wire and conduit type and sizes;
  - .8 Particular model number of hardware;
  - .9 Dedicated circuit in electrical panel to be used (for new installations);
  - .10 Progress photographs (only of areas with concealed work);
  - .11 Panels and power supplies (location to be installed);
  - .12 Field equipment (location of mounting);
  - .13 All device programming names;
  - .14 Contractor's stamp, signed by Contractor's authorized representative certifying approval of submissions, verification of field measurements and compliance with Contract Documents.
- .3 The Project Manager may change any drawing to remove, add or relocate any device. The Successful Bidder shall make any changes in the shop drawings, which the Project Manager may require consistent with the Contract Documents and resubmit unless otherwise directed by the Project Manager. The Successful Bidder shall notify the Project Manager in writing of any revisions other than those requested by the Project Manager and are subject to approval by the City Project Manager.

**9 PROJECT COMMENCEMENT**

- .1 Prior to the commencement of installation the successful bidder will submit the following:
  - .1 The Security Contractor shall submit to the Corporate Security Lead the required Active and Passive network equipment specifications for all locations in scope
  - .2 The specifications and active network equipment shall be in compliance with the City Networking standard and based on Cisco active networking equipment.

- .3 The Security Contractor shall submit a network communication and bandwidth flow chart for the proposed system this shall include communication steps between the various VSS components operating in normal and failover modes and their respective estimated network bandwidth requirements
- .2 Near project closeout and before project site acceptance testing the security contractor shall submit the following draft documentation in electronic form to the COT Project Manager:
  - .1 Draft test results of device and components installed
  - .2 Draft test result of cable inspection, testing and verification
  - .3 Draft schedule of all installed and/or configured devices listing as a minimum the following (Network configuration, Switch & port connectivity, location, Name/labeling, Serial Number, Warranty Start & Expiry date, Device Username/Passwords, Device IP and MAC Address, Function, etc....) in editable MS Excel format.

10

#### **AS-BUILT DOCUMENTATION**

- .1 Upon successful completion and acceptance of each security project, the Successful Bidder shall submit one (1) electronic set of record documentation and drawings to City of Toronto Corporate Security within ten (10) calendar days from the date of acceptance.
- .2 As-built shall include drawings and shall be in the FORM of black line set, record drawings on AutoCAD 2005, as well as a .pdf version, and are to be provided on a clean CD-ROM, DVD, or via e-mail.
- .3 Drawings shall include:
  - .1 Shop drawing submittals;
  - .2 Wiring diagrams for each location (include distances);
  - .3 Details of types of wire and conduit (include type and size);
  - .4 Particular model number of hardware (to match Summary of Security Devices Table to be provided by COT);
  - .5 Approval of drawing submittals;
  - .6 Beneficial occupancy date;
  - .7 Project Completion date;
  - .8 Equipment manufactures;
  - .9 Factory Acceptance Tests;
  - .10 Installation procedure;
  - .11 O&M manuals; and,
  - .12 Manufacturer's specification sheet.
- .4 Architectural: site plans, building plans, and floor plans showing all locations for every security device both new as well as any effected existing device.
- .5 All security devices depicted in the drawings must be individually labelled according to the programming on the security system to ensure tagging consistency.

- .6 All security device symbols depicted must be in conformance to the Security Industry Association Architectural Graphic Standards for Security System Layout SIA/IAPSC AG-01-1995.12 (R2000.03).
- .7 A Summary of Security Devices Table, as installed in Excel format. The table shall include the following for each security device: Security Device CAD Symbol, Make, Model, Serial number, IP Address, MAC address, Device Type/Function, Install Date, Installing Company, network configuration, Switch & port connectivity, VLAN, location, Name/labeling, Serial Number, Warranty Start & Expiry date and a photograph of each installed device. A template will be provided by the COT.
- .8 Wiring diagrams and/or schedules for each system defining the interconnection of all inputs and outputs for all equipment/security devices/electrical connections including description of location and/or name of each device.
- .9 Construction Typical for all security applications.
  - .1 As-built shall include all information required in the prefabrication submittals revised to reflect "as installed" conditions.
  - .2 As-built shall also include one (1) sets of complete and current operation and Maintenance manuals for all devices and equipment.
  - .3 The Successful Bidder is solely responsible to include engineered stamped drawings when required by the City.
  - .4 As-builts may not have any written notes on them all entries must be electronic.

11

**INSTALLATION STANDARDS AND REQUIREMENTS**

- .1 All direction for scope of work must be provided by the COT Project Manager. Any work completed without approval of the COT Project Manager may have to be altered at the COT request and without additional cost to the COT.
- .2 The Successful Bidder must deliver the specified Products and/or Services as per their Quotation without substitution or deviation.
- .3 The Successful Bidder shall be solely responsible for detailed design, project management, coordination, equipment procurement, installation, component wiring, terminations, connections, labelling, programming, integration, testing, commissioning and issuing of required documentation of City systems.
- .4 The Successful Bidder shall restore all property temporarily removed, damaged, or destroyed during the supply, delivery, and installation, of Products to the satisfaction of the City and at no cost to the City. The Successful Bidder, before final payment, shall remove all surplus materials and any debris of every nature resulting from its operation and put the site(s) in a neat, orderly condition; thoroughly clean. If the Successful Bidder fails to clean up at the completion of the supply, delivery, and installation of the Products, then the City may do so and charge the Successful Bidder for the costs thereof, or deduct said costs from any monies still owing to the Successful Bidder.
- .5 The Successful Bidder shall furnish all labour, materials, services, special equipment, supplies, tools, equipment, testing equipment, apparatus, trade tools, transportation, facilities and incidentals required and perform all operations necessary to accomplish the complete installation of the Product(s).
- .6 The Successful Bidder is responsible for all final wiring, integration and terminations of all systems.

- .7 Testing and commissioning is to be performance according to City and NFPA standards. Specific documentation to achieve this will be developed with the successful bidder and final template approved by City of Toronto (COT).
- .8 Unless authorised by the Project Manager, the Successful Bidder must flush mount all devices. Back boxes / junction boxes, all devices, equipment and components installed must be equipped with tamper resistant screws/fasteners.
- .9 Any back boxes / junction boxes must be installed on secure side (if applicable).
- .10 The Successful Bidder must ensure the electronic door operators are integrated with the access control system, and only activate when a valid card is presented. If not included during the quotation process, all associated costs will be at the Successful Bidders expense.
- .11 The Successful Bidder will ensure programming for any CCure systems is completed to Standard and report to maintenance mode Journal for a minimum of one week after successful site testing and deficiency correction. After one week, should no deficiencies exist, the Successful Bidder will remove the system from Journal and fully activate at the request of the City Corporate Security Lead.
- .12 All card readers must be ordered and programmed to City Standard/format and as directed by the City Corporate Security Lead.
- .13 All exit buttons are to be green in colour and embossed with the label "EXIT", no other type will be accepted even if quoted. Any errors will result in replacement by the Successful Bidder at no additional cost to the City.
- .14 All intercoms are to have a red button with red led status indicator that is used to communicate, no other type will be accepted even if quoted. Any errors will result in replacement by the Successful Bidder at no additional cost to the City.
- .15 Each facility covered under this contract shall be handed over to the City by the Successful Bidder as a turnkey operation.
- .16 Any power supplies, or other parts that are required shall be supplied by the Successful Bidder and shall be included in the quoted price. Power supplies must operate all connected hardware in all conditions.
- .17 The Successful Bidder shall be responsible for provisions of power, if it should not be present at a location. Dedicated power circuits shall be installed for each new device that will be installed as part of this project.
- .18 Any required expansion boards, ancillary equipment, needed for a full operation of the system are the responsibility of the Successful Bidder and must be included in the quote. Should they not be included but be required to operate the system then it will be the successful bidders responsibility to provide without cost to the City.
- .19 All device conditions and alarms shall be individually enunciated on the relevant system, as required for each specific project scope.
- .20 The Successful Bidder shall be responsible for the installation of all the equipment, units, and sub-systems, at all sites in order to meet all requirements specified in this document, as per all applicable standards, and as per manufacturer's intent.
- .21 All installation materials, accessories and special equipment, Services, Personnel, test equipment and tools required for installation of the equipment shall be provided by the Successful Bidder.

- .22 The Successful Bidder shall be responsible for all required trenching, civil work, and any associated costs.
- .23 The Successful Bidder shall provide all programming data required to achieve the specified functionality for each effected system (this includes situations where existing technology is being replaced with new technology). Such programming shall include (but is not limited to) programming of all alarms, events, triggers, timers, objects transmitting and receiving signals, networking, bandwidth settings, frame rates, images per second, permissions, integration between systems, and interfaces as well as programming of signal receiving centre equipment to provide 100% full functionality.
- .24 It is required that disruptions be minimized keeping the existing intrusion detection systems or video surveillance systems operational during the process of upgrading to the new systems until all devices from the new system are functional and ready to be used by the end user. Consideration for the critical nature of all facilities operations and occupants is crucial to the success of the project.
- .25 Any new materials used by the Successful Bidder to commission the existing devices to the new system shall be covered by the warranty under this contract.
- .26 All existing devices that will be re-used by the Successful Bidder shall be commissioned to the new systems as defined by the COT.
- .27 All existing devices that will be replaced with new devices under the scope of work of any specific project shall be removed by the Successful Bidder. The removal of existing equipment or parts which will not be used with the new installations shall be completed by the Successful Bidder. Parts in working order are to be returned to address noted below. Other parts to be disposed by bidder.

**Scarborough Civic Centre,  
Lower Level, Security Storage Room  
150 Borough Drive  
Toronto, Ontario, Canada  
M1P 4N6**

Working parts under 5 years old to be return are as follows:

- .1 Electric Strike
- .2 DVRs, NVRs
- .3 Servers
- .4 Security Network Switches
- .5 Cameras
- .6 Camera Mounts
- .7 Encoders
- .8 UPS
- .9 Request to Exit Buttons
- .10 Intercoms
- .11 Wall mounted duress buttons

- .12 Sirens
- .13 Communication Boards/Panels
- .14 Long Range Motion Sensors
- .15 Maglocks
- .28 Where this section applies, the Successful Bidder must provide the City a minimum of 24-hours' notice of delivery of old functioning electronic security hardware, electro-mechanical security hardware, and mechanical hardware. All other equipment not required to be delivered to the City shall be disposed of at the Bidder's expense.
- .29 All costs and expenses associated with returning old equipment shall be the responsibility of the Successful Bidder.
- .30 The Successful Bidder shall reuse existing conduit runs whenever feasible and run new cabling in the existing conduit runs. Where existing conduit is used the new and existing cables must not experience any negative performance indications. Any deficiencies found after installation must be corrected by the successful bidder at no cost to the COT.
- .31 The Successful Bidder shall be responsible for patching up holes left by existing equipment and making good all repairs where new equipment is being installed in the same place.
- .32 All installed equipment shall be fully functional and shall be capable to be monitored at each individual site as well as the Corporate Security Control Centre located at 703 Don Mills Road.
- .33 Devices such as communication boards or input/output boards shall not be installed on door of panels. Additional panels shall be installed by the Successful Bidder to accommodate the installation of such devices.
- .34 Upon completion of the installation of the equipment at each location, the Successful Bidder shall provide to the Project Manager the serial numbers and model numbers of all newly installed equipment, these are to be included in the Summary of Security Devices Table referenced in section "As-Built Documentation 10.7".
- .35 The Successful Bidder shall install plywood backboards for mounting of all infrastructure equipment which require such backing to be able to be safely mounted to a wall such as electronic key cabinets, panels, and power supplies, etc.
- .36 Connect equipment to the closest approved available panel/switch/computer with available inputs and outputs.
- .37 Any new and existing cables for all devices which are exposed on the surface of a wall or ceiling or any other accessible surface shall be placed in conduit or wire moulding by the Successful Bidder as directed by the COT. This conduit/moulding shall be sized to allow for additional 25% increase in cable and include a cable pull string for future use. Type of conduit/moulding to be confirmed on specific project site meetings with COT. Plenum rated cable must be used in any spaces requiring plenum rated cabling as per building and/or electrical code. All cabling, conduit, and installation methods utilized must meet COT IT Cabling Standards, manufacturer recommendations, and both the Electrical and Building Codes.
- .38 All infrastructure equipment including power supplies, transformers, communication devices, controllers, recording devices, etc. must be installed in secure cabinets. The Successful Bidder shall provide and install such cabinets and mount all of the equipment inside the cabinets. All costs for such cabinets shall be included in the quoted price.

- .39 Video Surveillance installation and camera field of view shall be in compliance with applicable local privacy laws, the City video surveillance privacy policy and shall be approved by the Corporate Security Lead.
- .40 All IP enabled devices such as IP Cameras, Encoders, iStar's, NVR's, card readers, controllers, etc. shall be tagged with an appropriate device name in coordination with the Corporate Security Lead.
- .41 Typical naming conventions are as follows however final naming convention shall be coordinated with and approved by the Corporate Security Lead prior to the commencement of any device setup or installation:
  - .1 Site Address-NVR/Controller Number/Name
  - .2 NVR's shall be numbered sequentially as added
  - .3 Device numbers shall match port number on attached switch or controller
  - .4 Ex: 1008YNG-NVR9-CAM3
- .42 All IP Cameras and Encoded Cameras shall be programmed on the VSS to display a short form naming. This Naming shall be coordinated with and approved by the Corporate Security Lead prior to configuring the VSS.
  - .1 Typical Camera/device short FORM name on Milestone system would be:
    - .1 1008YNG-F3-NW STAIR-3
- .43 The Security Contractor shall carry the cost of all required access hatches where required and shall patch and paint to match existing paint; all locations for access hatches shall be pre-approved by the Corporate Security Lead in writing before working on these access hatches.

12

**VSS DESIGN CRITERIA**

- .1 The VMS architecture shall permit centralized administration and management for the IP VSS and its distributed components across the City's local and wide area corporate networks. This administration shall be redundant providing seamless failover capabilities and continuous operation in the event of failure of one of the main IP VMS services.
- .2 The VMS shall allow for continuous system management and operation through resilient server clusters on the City provided domain, between 55 John Street and 703 Don Mills. This resiliency shall span the Management, SQL Database and Event servers providing continued operation at the primary and/or the secondary site depending on failure cause and location of components, infrastructure and/or related services.
- .3 The VMS shall allow for administering and managing the complete VSS system from any workstation having the Milestone XProtect® management client application installed and connected to the Corporate Security Lead's Corporate Network.
- .4 The VMS shall keep all (Audit, Event, and Rule and System logs) for duration of 60 days. Any storage or other specifications required from the Corporate Security Lead provided equipment shall be included and provided by the security contractor to the Corporate Security Lead as part of the server Specifications required.
- .5 The following will be supplied by the City of Toronto or other project Contractor (ICT):
  - .1 Microsoft SQL Software and Licenses

- .2 Physical Servers required for Milestone VMS Management Services including Microsoft Windows Server 2008/2012 Licenses:
  - .1 Management Server
  - .2 Event Server
  - .3 SQL Server
  - .4 Mobile Server
- .3 Client (user) Workstations
- .4 VSS Core Network Switches (Cisco Switches)
- .5 VSS Access Layer Switches (Cisco Switches)
- .6 SAN Network Switches (Cisco Switches)
- .7 Ethernet Cat6A Patch Panels
- .8 Fiber Patch Panels in VSS Racks
- .9 Fiber connectivity between existing telecom rooms, entrance facilities and equipment rooms.
- .6 The Security Contractor shall specify the required Cisco switch models, and configuration required for the VSS, and the SAN to operate fully (including interface modules, IOS software, ports, Supervisor Engine, Backplane BW, POE Power/port, QOS Groups & Types, etc....). It is the responsibility of the Security Contractor to ensure specified network infrastructure is adequate for the complete system operation in normal and failover modes. The Security Contractor is responsible to coordinate and provide all detailed server specifications required for the system full operation to the Corporate Security Lead IT departments. Should the switch be determined to not be functionally appropriate by the COT, it shall be replaced by the successful bidder with an appropriate device at no additional cost to the COT.
- .7 Provide all VSS components and accessories required for achieving the full required functionality including but not limited to IP cameras, power supplies (Where Applicable), transmission media converters and extenders, modules, Video Encoders, mounts, enclosures, cables, plenum rated back boxes/enclosures/kits and IR Illuminators etc....
- .8 The only acceptable video compression (digital encoding) method shall be non-proprietary H.264 encoding (Baseline and/or Main Profile)
- .9 The VMS shall transmit and communicate over Corporate Security Lead IP network LAN/WAN, Fibre cables, Ethernet cables, Coaxial cables and Elevator installed coaxial cable infrastructure.
- .10 The Security Contractor shall warranty and ensure network bandwidth transmission performance, display, compression and network latency, PC client workstation, NVR's, SAN's and VMS server performance is designed and engineered to be sufficient, functional and in accordance with Milestone Systems VMS equipment and VSS hardware manufacturer.
- .11 The Security Contractor shall be sensitive to network bandwidth requirements and communicate all requirements to the Corporate Security Lead. It will be the sole responsibility of the Security Contractor to design and engineer all network transmission paths under the performance conditions of this specification and the requested deliverables.

- .12 All VSS Servers and workstations will have corporate antivirus agents installed by the Corporate Security Lead's IT Team prior to the installation. The additional travel time incurred by the successful bidder for deliveries to required sites for programming shall be at no charge to the COT.

### 13 **VIDEO RECORDING**

- .1 All video must be stored for 37 days. the local NVR disks must be capable of recording for the full thirty seven (37) days, at full system capacity.

- .2 Network Video Recorders:

- .1 Minimum requirements include:

- .1 RAID1 OS Volume array (2 x 240GB SSD)
    - .2 RAID controller with minimum 512MB Battery backed cache
    - .3 Enterprise Remote management capabilities, with virtual media and console access capabilities c/w out-of-band interface
    - .4 RAID 1 Volume array for recording live video (15K RPM or better).
    - .5 RAID 5 Volume array for archived video (7.2K RPM or better).
    - .6 At least one global hot spare
    - .7 All hard drives shall be Enterprise / Data centre grade
    - .8 All DISK I/O's should run at no more than 80% of the maximum System capacity under normal operating conditions including Antivirus software, Encrypting Video and other required system services. 20% overhead shall remain free.
    - .9 NVR's shall be equipped with Enterprise server network cards
    - .10 Each NVR shall be equipped with two network ports for live viewing and two separate ports for recording video. All camera recording streams shall be on a separate VLAN.
    - .11 Each NVR shall have a redundant and resilient connection to the SAN (where applicable) through a dedicated network
    - .12 NVR Hardware shall be off-the shelf HP or DELL Servers
    - .13 The NVR solution and design shall be certified and approved by Milestone Systems to meet the performance requirements of the VMS solution.
    - .14 All Recorders to be configured and connected to COT centralized Milestone management system.

- .3 **Class A Recorder**

- .1 Recording 16 or less local IP Video or Camera streams each streaming H.264 compressed video at a resolution of 1920x1080p, frame rate of 15fps, stream bandwidth of 2400Kbps/Stream, with 100% estimated scene motion, and continuously recording for 24hrs for a total of thirty seven [37] days retention period without any altering or compression to original recorded streams (i.e.: reducing P frames, or other compression techniques)

- .2 Allow for thirty-seven [37] days continuous recording on the local NVR RAID5 Storage Array with hot spare disk.
- .3 The following is an example of the required NVR. Equivalents, or others, approved by Milestone to be presented to City of Toronto for an approval.

<b>Primary/Redundant NVR Specifications</b>	
<b>Requirements</b>	
Processor/Chipset	1 x Intel Xeon E5-2620 v3 2.4GHz (or COT approved equivalent)
Operating System	Microsoft Windows Server 2012 x64 Standard
Monitor	<i>Refer to TR Typical for KVM requirements</i>
System Memory	Minimum 32GB 1600MHZ DDR3 Memory
Hard drives/OS	2 x 240GB Solid State SATA drives, 6Gbps 2.5in Hot-plug Drive, 3.5in (Raid 1)
Hard Drives/Live video	2 x 900GB 15K RPM SAS 2.5in Hot-plug Hard Drive, 3.5in (Raid 1)
Hard Drive/Archive	8 x 8TB 7.2K RPM SATA 6Gbps 512e 3.5in Hot-plug Hard Drive (Raid 5 + Hot spare)
RAID Controller	Enterprise Class Raid Controller with minimum 1GB Cache, supporting required disks and RAID levels with battery backup and write-back cache support.
Graphics	On board
Network	Broadcom 5720 QP 1Gb Network Daughter Card
I/O Ports	USB 2.0 or USB 3.0
Chassis Type	Rack mount, c/w pull out rails (tool-less mounting with square holes) Chassis with up to 12, 3" .5" Hard drives +2, 2.5" Flex Bay Hard Drives
Expansion Slots	Minimum 3x PCIe (2x16 Bandwidth, x8 Bandwidth)
Security	Chassis Intrusion Switch Setup/BIOS Password; lockable bezel
Remote Management	Enterprise remote virtue media and console access capabilities c/w out-of-band interface (Ex: IDRAC7 Enterprise or COT approved equivalent)
Power	Dual, Hot-plug, Redundant Power Supply (1+1), 750W
Support	4-Hour 7x24 On-Site Service with Emergency Dispatch, 3Year

**.4 Class B Recorder**

- .1 Recording 32 or less local IP Video or Camera streams each streaming H.264 compressed video at a resolution of 1920x1080p, frame rate of 15fps, stream bandwidth of 2400Kbps/Stream, with 100% estimated scene motion, and continuously recording for 24hrs for a total of thirty seven [37] days retention period without any altering or compression to original recorded streams (i.e.: reducing P frames, or other compression techniques)
- .2 Allow for thirty-seven [37] days continuous recording on the local NVR RAID5 Storage Array with hot spare disk.

- .3 The following is an example of the required NVR. Equivalents, or others, approved by Milestone to be presented to City of Toronto for an approval.

<b>Primary/Redundant NVR Specifications</b>	
Requirements	
Processor/Chipset	1 x Intel Xeon E5-2620 v3 2.4GHz (or COT approved equivalent)
Operating System	Microsoft Windows Server 2012 x64 Standard
Monitor	<i>Refer to TR Typical for KVM requirements</i>
System Memory	Minimum 32GB 1600MHZ DDR3 Memory
Hard drives/OS	2 x 240GB Solid State SATA drives, 6Gbps 2.5in Hot-plug Drive, 3.5in (Raid 1)
Hard Drives/Live video	2 x 900GB 15K RPM SAS 2.5in Hot-plug Hard Drive, 3.5in (Raid 1)
Hard Drive/Archive	8 x 8TB 7.2K RPM SATA 6Gbps 512e 3.5in Hot-plug Hard Drive (Raid 5 + Hot spare)
RAID Controller	Enterprise Class Raid Controller with minimum 1GB Cache, supporting required disks and RAID levels with battery backup and write-back cache support.
Graphics	On board
Network	Broadcom 5720 QP 1Gb Network Daughter Card
I/O Ports	USB 2.0 or USB 3.0
Chassis Type	Rack mount, c/w pull out rails (tool-less mounting with square holes) Chassis with up to 12, 3" .5" Hard drives +2, 2.5" Flex Bay Hard Drives
Expansion Slots	Minimum 3x PCIe (2x16 Bandwidth, x8 Bandwidth)
Security	Chassis Intrusion Switch Setup/BIOS Password; lockable bezel
Remote Management	Enterprise remote virtue media and console access capabilities c/w out-of-band interface (Ex: IDRAC7 Enterprise or COT approved equivalent)
Power	Dual, Hot-plug, Redundant Power Supply (1+1), 750W
Support	4-Hour 7x24 On-Site Service with Emergency Dispatch, 3Year

.5 **Class C Recorder**

- .1 Recording 64-128 local IP Video or Camera streams each streaming H.264 compressed video at a resolution of 1920x1080p, frame rate of 15fps, stream bandwidth of 2400Kbps/Stream, with 100% estimated scene motion, and continuously recording for 24hrs for a total of thirty seven [37] days retention period without any altering or compression to original recorded streams (i.e.: reducing P frames, or other compression techniques)
- .2 Allow for thirty-seven [37] days continuous recording on the local NVR RAID5 Storage Array with hot spare disk.
- .3 The following is an example of the required NVR. Equivalents, or others, approved by Milestone to be presented to City of Toronto for an approval.

**Primary/Redundant NVR Specifications**

Tender

Requirements	
Processor/Chipset	2 x Intel Xeon E5-2660 v4 2.0GHz (or COT approved equivalent)
Operating System	Microsoft Windows Server 2012 x64 Standard
Monitor	<i>Refer to TR Typical for KVM requirements</i>
System Memory	Minimum 64GB 1600MHZ DDR3 Memory
Hard drives/OS	2 x 250GB Solid State SATA drives, 6Gbps 2.5in Hot-plug Drive, 3.5in (Raid 1)
Hard Drives/Live video	2 x 900GB 15K RPM SAS 2.5in Hot-plug Hard Drive, 3.5in (Raid 1)
Hard Drive/Archive	10 x 10TB 7.2K RPM SATA 6Gbps 512e 3.5in Hot-plug Hard Drive (Raid 5 + Hot spare)
RAID Controller	Enterprise Class Raid Controller with minimum 1GB Cache, supporting required disks and RAID levels with battery backup and write-back cache support.
Graphics	On board
Network	2 x Broadcom 5720 QP 1Gb Network Daughter Card
I/O Ports	USB 2.0 or USB 3.0
Chassis Type	Rack mount, c/w pull out rails (tool-less mounting with square holes) Chassis with up to 12, 3" .5" Hard drives +2, 2.5" Flex Bay Hard Drives
Expansion Slots	Minimum 3x PCIe (2x16 Bandwidth, x8 Bandwidth)
Security	Chassis Intrusion Switch Setup/BIOS Password; lockable bezel

Power	Dual, Hot-plug, Redundant Power Supply (1+1), 750W
Support	4-Hour 7x24 On-Site Service with Emergency Dispatch, 3Year

#### 14 **VSS STORAGE AREA NETWORK (SAN)**

- .1 The SAN shall have the following minimum requirements:
  - .1 Equipped with redundant and hot-swappable power supplies and cooling Fans
  - .2 Support hot-swappable drives, each configured RAID 5 volume should be configured to have a hot spare disk available
  - .3 Support both iSCSI (1GB, 10GB), FCoE (10GB), FC (4-16GB) with Hot Swappable controllers
  - .4 Provide a minimum effective (Usable) total storage capacity of RAID5 configured arrays to allow for the required video storage retention of 30 days from each of the NVR's connected to it
  - .5 Expandable to allow for additional 30% effective storage capacity and the connectivity of additional two [2] NVRs
  - .6 Support redundant and load balancing SAN connectivity to each NVR Server.

- .7 Support multiple RAID levels on connected storage within an array.
- .8 Enough processing power and backplane bandwidth to support the total IOPS required for recording and retrieval of the video to and from the storage array.
- .9 Enough memory bandwidth to support the buffering and queuing of system I/O's and transferred data.
- .10 Equipped with battery backed cache for all array controllers (minimum 512MB)
- .11 Intuitive enterprise level management and monitoring interface that can scale across the multiple SAN's
- .12 Preference for remote monitoring and support features.
- .2 The SAN shall be connected on its own dedicated local network; the security contractor shall provide the Cisco Network switches specifications and Media interface types required and coordinate these requirements with the Corporate Security Lead Networking Team. SAN network traffic shall not interfere with the any other network traffic.
- .3 All Patch Cables, labeling and connectivity between the SAN, Servers and SAN Network shall be the responsibility of the Security Contractor.
- .4 The management interface of the SAN shall be connected to the Corporate Security Lead's corporate network to allow for remote management and control.
- .5 The SAN solution and design shall be certified and approved by Milestone Systems to meet the performance requirements of the VMS solution.
- .6 Dell products are preferred, however alternatives approved by Milestone and which meet the above specifications will be considered.
- .7 DAS devices can be used instead of SAN where approved by the COT. The specified DAS must be approved by Milestone, achieve the desired recording duration, and allow for 25% video surveillance system growth. Dell and HP products are preferred, alternatives would have to be approved by the COT.
- .8 The below are the minimum DAS requirements. Equivalent, or others, approved by Milestone will be considered.

Minimum Specifications
<b>Hardware</b>
Minimum 8GB RAM
Dual Controller Array configuration
RAID Array Controller w/I GB Battery Backed Cache
DUAL Hot Swappable 10/100/1000 Ethernet Controllers with 4 ports each
<b>Disk Configuration</b>
SATA 7.2k RPM or better disks (Size or Disks Varies with required Storage, min 4TB disks rated for Enterprise DAS Storage and Video streaming applications)
Storage Volume to be configured as a RAID 10 Array

- .1 Install dome cameras in flush surface or drop ceiling with concealed cabling
- .2 Configure cameras internal access with a new Username/Password credentials and **remove default logins**
- .3 Configure cameras with secure access protocols, VLANs, QOS and other network settings in coordination with the Corporate Security Lead. Cameras shall be totally secured to authorized access before being connected to the Corporate Security Lead's Network
- .4 All Cameras include elevator cab cameras shall be named in coordination with the Corporate Security Lead naming scheme and configured to sync with the Corporate Security Lead's local NTP server/VMS system
- .5 Configure each camera stream settings including but not limited to frame rate, bitrate, compression, stream name, day night setting, and other related configuration in coordination with the Corporate Security Lead. All configurations shall be approved by the Corporate Security Lead before setting and configuring the devices
- .6 Configure and calibrate cameras for the lighting conditions at each camera location including setting shutter speeds, AWB, Exposure levels, Day/Night mode, WDR, AGC, and other related settings to produce optimal video pictures under all operating conditions
- .7 Ensure Cameras are operating the latest firmware version or as recommended by the manufacturer at time of installation.
- .8 Backup all camera settings/configurations in addition to the VMS configurations to a CD/DVD and submit to Corporate Security Lead.
- .9 Ensure outdoor cameras and their heater are properly powered to operate normally in all environmental conditions referenced in this section.
- .10 All cameras with analytics capabilities shall be setup and calibrated for the supported alarms. Typical alarms to be configured by default for all cameras include:
  - .1 Motion in full or designated field of view zones
  - .2 Video Masking
  - .3 Video Loss/Gain
  - .4 Network Loss
  - .5 Device I/O's
- .11 Configure logging and network troubleshooting capabilities on each IP cameras in coordination with the Corporate Security Lead.
- .12 Configure Network Security features and settings on each camera in coordination with the Corporate Security Lead.
- .13 For PTZ cameras configure Masks, home position, pre-sets, control sensitivity, image mode and other related settings in coordination with the Corporate Security Lead.
- .14 All camera installations and field of view setup shall meet the VSS primary functions identified by the Corporate Security Lead. The following minimum resolution requirements are required for each of the VSS functions below:
  - .1 General Observation: >20ppf on farthestmost desired target
  - .2 Forensic Review (General Identification): >40ppf on farthestmost desired target

- .15 Recognition including Facial, vehicle license plate, color, pattern, and cross-line recognition: > 80ppf on farthest desired target
- .16 All camera views, resolution and image color and quality, shall pass the approval of the Corporate Security Lead.

## 15.2 **IR ILLUMINATORS**

- .1 All IR illuminators specified for specific camera installation projects are to be:
  - .1 Mounted and calibrated not to over expose the image quality during night time operation.
  - .2 All IR accessories shall be POE Powered unless otherwise approved by the Corporate Security Lead.
  - .3 All IR shall be IP66, Vandal resistant and mounted securely or be built-in to the camera. .4 IR 850nm wavelength, equipped with a Photocell and configured to activate on environmental lighting conditions.

## 16 **VIDEO ENCODERS**

- .1 The following are the minimum performance specifications for Video Encoders to be specified by the successful bidder:
  - .1 Rack mounted
    - .1 Flexible and Expandable allowing for hot swappable blades (applies to encoders for 1 channels or more)
    - .2 Equipped with redundant hot swappable power supply and fans (applies to encoders where more than 8 channels are required)
    - .3 Each encoder channel shall support H.264 video compression, a minimum of two simultaneous streams at 720 (horizontal) × 486 (vertical) NTSC analogue video resolution and 30fps.
    - .4 Each encoder channel shall have a minimum of one [1] configurable input/output .6 Security Contractor shall ensure the encoders support the PTZ protocols and control connectivity (RS- 485, RS-422) for connected PTZ analogue cameras
    - .5 Each encoder shall support the following analytics for each video channel and shall trigger an alarm on Milestone Systems XProtect Corporate® VMS:
      - .1 Camera repositioning
      - .2 Camera lens is masked, sprayed, covered or blocked
      - .3 Motion detection in defined zones of the camera view, minimum five [5] zones
    - .6 Each Encoder shall support the following alarms and shall be annunciated on the Milestone monitoring interface:
      - .1 .1 Video Signal loss /gained per channel
      - .2 .2 Network loss/gained

- .7 Encoder shall be ONVIF compliant and supports (Profile S)
- .8 Encoder shall support the following protocols: IPv4/v6, HTTPS, SSL/TLS, QoS Layer 3, FTP, CIFS/SMB, SNMPv1/v2c/v3 (MIB-II), DNS, NTP, RTSP, RTP, TCP, UDP, IGMP, RTCP, ICMP, DHCP.
- .9 Shall support remote firmware upgrade.
- .2 All Encoders shall be rack mounted in a proper cabinet.
- .3 Configure each encoder interface and chassis (where applicable) with secure access protocols, VLANs, QOS and other network settings in coordination with the Corporate Security Lead. Cameras shall be totally secured to authorized access before being connected to the Corporate Security Lead's Network.
- .4 Each encoder channel shall be named in coordination with the Corporate Security Lead naming scheme and configured to sync with the Corporate Security Lead's local VSS NTP server/VMS system
- .5 Configure each channel stream settings including but not limited to frame rate, bitrate, compression, stream name, day night setting, and other related configuration in coordination with the Corporate Security Lead. All configurations shall be approved by the Corporate Security Lead before setting and configuring the devices
- .6 Ensure Encoders are operating the latest firmware version
- .7 Backup all Encoders settings/configurations in addition to the VMS configurations to a CD/DVD and submit to Corporate Security Lead.
- .8 Ensure Encoder chassis is powered through a UPS and backup power to operate normally in all environmental conditions referenced in this section
- .9 All encoder channels with analytics capabilities shall be setup and calibrated for the supported alarms. Typical alarms to be configured by default for all cameras include:
  - .1 Motion in full or designated field of view zones
  - .2 Video Masking
  - .3 Video Loss/Gain
  - .4 Network Loss
  - .5 Device I/O's
- .10 Configure logging and network troubleshooting capabilities on each channel and encoder chassis in coordination with the Corporate Security Lead.
- .11 Connect and configure PTZ Data control protocols and settings on channels that are connected to analogue PTZ.

17

#### **ETHERNET MEDIA EXTENDERS**

- .1 The following are the minimum performance specifications for ethernet media extenders to be specified by the successful bidder in the event that the required product is not listed in the price form:
  - .1 Any camera that exceeds the standard 100BASE-TX connectivity distance limitation requires: 100Mbps Ethernet extenders to extend transmission with POE pass-through over standard 75Ω coaxial cables

- .2 Extended Pass-through POE: meets the IEEE 802.3af standard for Power over Ethernet
- .3 Supports Jumbo Frame Transmission
- .4 Extends up to a minimum of a minimum of 548m at 100BaseT with POE pass-through
- .5 Suitable for high bandwidth requirements of Mega-pixel cameras
- .5 Aluminum Enclosure
- .6 Meets NEMA TS-1/TS-2 environmental requirements

**.2 Power and Ethernet Over Coax**

- .1 The following are the minimum performance specifications for Power and Ethernet over Coax devices that are to be specified by the successful bidder:
  - .1 Proposed IP and PoE/PoE+ over Coax solution shall, as a minimum, meet the following requirements:
    - .1 Provide enough PoE or PoE+ (IEEE 802.3af/802.3at) to Power the IP devices in all conditions and up to 50W (ex: When built-in heater is activated, PTZ, blower where applicable)
    - .2 Provide adequate output power to power the devices and provide Ethernet transmission over the various types, lengths and quality of wiring existing at the locations in scope
    - .3 Has minimal end-to-end Latency of  $\leq 3\text{ms}$  that shall not affect the Video/Ethernet transmission over Coax
    - .4 Transceiver unit close to the edge device shall operate normally in outdoor environmental conditions as mentioned under paragraph (2.3.2.1.2 Outdoor) and shall not require an extra power source to operate.
    - .5 Provide transient overvoltage and electrostatic discharge protection and immunity to a minimum of:  $5 \times 20\mu\text{S}$  3,000A 6,000V; ESD protection for 200pF 20KV.
    - .6 Provide an encrypted Coax link with a minimum of 128Bit AES encryption.
    - .7 Head-end transceivers shall be rack mounted in standard 19" rack cabinets, for single channel transceivers a rack mounting kit shall be used to securely and neatly mount a single transceiver to the rack (placing unit on trays or loosely in the cabinet is not acceptable).

**.3 VSS Power Component**

- .1 The following are the minimum performance specifications of VSS Power Components that are to be specified by the successful bidder.
  - .1 All VSS system components including but not limited to (POE Switches, Camera power Supplies, NVR Servers, VMS Servers, Encoders, Media converters, KVM Switches, Environmental and Cabinet Sensors, SAN etc....) shall be powered from a UPS backed by emergency power (where available) allowing for continuous, un-interrupted, operation of the complete VSS system for duration specified by COT during project quote

phase. COT will require proof of MSRP from UPS manufacturer with MSRP discount applied as provided in the Price Form. The UPS system shall protect connected equipment from brownouts, overvoltage and other power irregularities.

- .2 All UPS equipment shall be securely rack mounted in cabinets. UPS equipment shall not be placed on shelves, installed on the ground or placed inside cabinets without proper rack rails or rack mounting kits unless approved by the Corporate Security Lead.
- .3 The complete IP VSS system and its distributed components shall be connected to a UPS for continued operation (provisioned at maximum power usage) where a backup circuit is available. The required power backup operation window shall include the provisioning for future expansion.
- .4 In addition to the above requirement the following shall apply for UPS selection and sizing:
  - .1 Securely rack mounted in a secure lockable cabinet
  - .2 Sized to allow for a minimum of 40% extra power for future expansion
  - .3 cUL listed and meets the following standards: UL 1449, UL 1778, CAN/CSA-C22.2 NO. 60950-1-07(R2012)
  - .4 Provides surge protection and filtering
  - .5 Supports USB management, c/w windows software and management application to allow for server controlled shutdown upon reaching a set low battery threshold or internal Web based management interface
  - .6 Alarms when on battery and c/w status LED indicators for normal operating mode, alerts and battery backup mode
  - .7 Maintenance-free, sealed, user-replaceable and leak proof Lead-Acid Battery w/c automatic self-testing circuitry detecting and ensuring proactive alerts for battery replacement and/or faults
  - .8 Resettable circuit breaker and automated recovery, ensures protection of connected loads from surges, spikes, lightning and other power disturbances
  - .9 Medium & Large TR's to be equipped with expandable and upgradable rack mounted UPS units including sliding rack rails allowing for ease of maintenance, upgrades and serviceability
- .5 All new VSS IP Cameras shall be powered by PoE or PoE+ from respective PoE capable switches or Ethernet with PoE/PoE+ pass through media extenders. No exceptions are accepted unless for special purpose cameras requiring external power where applicable. This exception shall be approved in writing by the Corporate Security Lead.
- .6 IP and PoE/PoE+ over Coax solution shall be used to power IP cameras in analogue to IP cameras retrofit scenario. All new IP cameras shall be powered by PoE/PoE+ and shall not be connected to existing power supplies that are not connected to a UPS System.

- .7 PoE power provisioning shall be communicated and coordinated with the Corporate Security Lead and Corporate Security Lead's Networking Team and specified as part of the Cisco Network equipment. No assumptions of PoE/PoE+ power availability shall be made on any Corporate Security Lead provided network access switches unless previously coordinated and requested in writing from the Corporate Security Lead.

18

#### **EQUIPMENT CABINETS/RACKS**

- .1 The Security Contractor shall be sensitive of the equipment room's space availability at the various locations in scope for rack installations. High density and low profile equipment should be considered in the proposed equipment design to reduce space requirements. The security contractor shall advise the Owner of any space required for additional rack quantities beyond what is provided and specified in the project scope. Corporate Security requires a dedicated secured rack for all security installations.
- .2 The following are the minimum performance specifications of various cabinets and enclosures that are to be specified by the successful bidder:
- .3 **NEMA 12 – Rack Cabinets W/ Self-Contained Cooling Unit**
  - .1 Pre-assembled before delivery
  - .2 Fully gasketed openings including gland plate in base
  - .3 Closed loop air-conditioning system, adequately sized to match equipment heat dissipation and cooling requirements (shall not require any piping, wiring or drainage) and shall also allow for 25% increase in heat generation of specified equipment. .4 Internal evaporator to eliminate condensation
  - .4 M6 Rail Type
  - .5 Plexi or Solid Doors
  - .6 Key Lockable secure doors and side panels
  - .7 Include casters and levelers
  - .8 Compatible vertical mounted PDU's
  - .9 Include cable management (vertical and horizontal lacing bars, front to back cable managers, bottom brush grommet kit, filler panels etc....) required for a neat cable and equipment installation
  - .10 Include grounding kit and ground appropriately
  - .11 Cabinet Size and Cooling Requirements shall be approved by Corporate Security Lead
- .4 **NEMA 12 - Wall Mount Cabinets**
  - .1 Pre-assembled
  - .2 Double hinged allowing access to the front and back side of cabinet
  - .3 NEMA 12 Fan Assembly
  - .4 Independent Key lockable from and back side
  - .5 Lifetime Warranty

- .6 M6 Rail type
- .7 Include cable management (vertical and horizontal lacing bars, front to back cable managers, bottom brush grommet kit, filler panels etc....) required for a neat cable and equipment installation
- .8 Cable management trays, and arms
- .9 Include grounding kit and ground appropriately
- .5 **Standard Rack Cabinets**
  - .1 42 U, Pre-assembled before delivery
  - .2 Vented Side Panels, with key locks
  - .3 Casters and levelers
  - .4 M6 Rails
  - .5 Split doors back and front side, with key locks
  - .6 6 x 4" fans top panel
  - .7 Include grounding kit and ground appropriately
  - .8 Include Vertical PDUs
  - .9 Include cable management (vertical and horizontal lacing bars, front to back cable managers, bottom brush grommet kit, filler panels etc....) required for a neat cable and equipment installation
  - .10 Cable management trays, and arms

19

**REAL-TIME ENVIRONMENTAL MONITORING COMPONENT**

- .1 Provide real-time, ethernet (IP) based environmental monitoring solution at each in of the existing and new VSS designated racks.
- .2 The monitoring unit shall be rack mounted
- .3 Shall have a dual temperature/humidity sensor, intelligent water temperature sensor and door contact sensors for each cabinet door
- .4 The monitoring component shall be connected to the City corporate network
- .5 Capable to notify the Owner of any changes or detections by the sensors in a variety of ways including e-mail and SNMP
- .6 Supports SNMP v1, v2, v3
- .7 Manageable through an intuitive web interface
- .8 **Rack KVM Tray**
  - .1 The following are the minimum performance specifications of Rack KVM Trays that are to be specified by the successful bidder.
    - .1 Integral KVM Switch with keyboard, LCD monitor, and touch pad in 1U FORM .2 Allows remote network user access through KVMoIP over WAN & LAN

- .2 Full Sized 105-Key keyboard
- .3 Ergonomic hand rest
- .4 Includes Universal Rear Rail Kit
- .5 CE, RoHS approved
- .6 Flip Open Monitor Minimum 19" TFT LCD monitor, 1280 x 1024 @ 60 Hz
- .8 Dual Rail Flip Open Monitor when Keyboard and Mouse are closed
- .7 Control via on-screen display (OSD) menu, push buttons Selection Buttons on monitor bezel, hotkeys, or mouse.
- .8 Connects to servers through CATx patch cables and required server access modules
- .9 16-Port CATx KVM
- .10 Provide BIOS Level Access

20

#### **LABELLING**

- .1 All cables shall be tagged, with a unique number, in common at both ends using a permanent method. Labelling shall agree with record drawings and point allocation tables and to indicate source and destination information.
- .2 All terminals shall be permanently tagged and shall agree with record drawings.
- .3 All system power supplies shall be labelled with their feed source and breaker number.
- .4 All connectors shall be marked with common designations for mating connectors. The connector designations shall be indicated on the record drawings.
- .5 All visible panel and control labels shall be silk-screened, engraved and filled, or engraved plastic laminate. Labels shall be permanently attached.
- .6 Labelled Doors and Frames in no instance shall any labelled fire door or frame be cut, penetrated, drilled or modified in any way.
- .7 Any labelled door or frame which shall require modification to meet the system specifications shall immediately be brought to the attention and written approval of the Project Manager.

21

#### **CONFORMITY OF WORK WITH PLANS AND SPECIFICATIONS**

- .1 The Successful Bidder shall perform all Work and furnish all materials and complete the whole of the Work in conformance with the requirements.
- .2 Any Work or material not herein specified but which may be fairly implied as indicated in the Contract or obviously necessary for the proper delivery of a fully functional system, shall be done or furnished by the Successful Bidder as if such Work or material had been specified.
- .3 The Successful Bidder shall at all times have on the Work site, competent Personnel capable of reading and thoroughly understanding the plans and specifications, and thoroughly experienced in the type of Work being performed. Such Personnel shall include the supervision and direction of all Subcontractors, if any are used. The designated Personnel shall have available at all times the lists/floor plans required.

- .4 Upon request, the Successful Bidder shall provide the City of Toronto Corporate Security a list of all Personnel's duties, responsibilities, and obligations for the Work required.

22

## **SUPPLY AND INSTALL PROJECT PROCEDURES**

- .1 The City of Toronto Corporate Security and the Successful Bidder shall follow the procedures set-out in General Contract Terms and Conditions for all supply and install Work. The standard Security Project Work Package which will be provided to the Successful Bidder has been created to ensure consistent implementation/execution of the individual projects regardless of the projects size and scope.
- .2 Prior to the execution of any supply and install projects the Successful Bidder shall familiarize and comply with the project procedures set-out in General Contract Terms and Conditions, Supply and Install Procedures Package.
- .3 **General Specifications**
- .1 The Deliverables being supplied in this document must be new and certified by the Vendor, and free of encumbrance. Refurbished, rebuilt, or used Products will not be acceptable.
- .2 All specifications are minimum requirements that must be met or exceeded. Bids containing one or more items that do not meet or exceed the minimum general specifications will be declared Non-Compliant.

23

## **IT COORDINATION**

- .1 Coordinate with the Corporate Security Lead team for all equipment programming. Upon approval, connect, test all equipment and ensure there are fully and properly operating
- .2 All security equipment configurations shall be performed by the Corporate Security Lead IT Team in coordination, and support from the Security Contractor
- .3 All IP enabled devices with Username/Password parameters shall be configured with a designated temporary credentials and provided to the Corporate Security Lead. Default credentials shall be immediately removed upon initial power up and configuration of the device.
- .4 All typical configurations shall be coordinated and approved by the Corporate Security Lead IT Team before configuring the devices. The additional travel time incurred by the successful bidder for deliveries to required sites for programming shall be at no charge to the COT.

24

## **LICENSING**

- .1 The City prefers any net new licenses required to be a onetime purchase. Support and maintenance agreements should be independent of the software license.
- .2 The Vendor should be able to provide to the City at no additional cost at least one (1) copy of the Documentation for each copy of a licensed software.
- .3 The Vendor should be able to grant to the City a perpetual, non-exclusive, irrevocable, transferable, fully paid-up, royalty-free right and license to install, use, and copy (on storage units or media for backup or other contingency purposes), all or any portion of each licensed software, together with all associated Documentation, in accordance with the Terms of the resulting Contract and:
- .1 The Vendor should provide to the City at least one (1) copy of each licensed software in installable FORM unless it has specified a greater number of copies;

- .2 If the City is licensed to use any licensed software on any computer or computer complex, the City may transfer the licensed software to any different computer or computer complex without any fee or other charges being due to the Licensor;
- .3 If the City is licensed to use any licensed software in conjunction with any operating system, the City may use the licensed software in conjunction with any other operating system without any fee or other charge being due to the Vendor if the licensed software is certified to operate on that other operating system when that use commences, regardless of whether the operating system was in existence or not in existence at the time the licensed software was originally licensed by the City;
- .4 If a CPU based license is provided, the CPU based license should be a perpetual license to use the licensed software on one physical CPU and such perpetual CPU license should not be conditional on any Terms and conditions not set out expressly in the Contract. The City may transfer the licensed software from one physical CPU to another physical CPU at any time or times without notice to the Vendor and without any fee or other charges being due to the Vendor. A CPU license for a physical CPU is not limited in any way by the use of multithreading, hyper-threading, or any quantity of logical CPU.
- .5 If concurrent user licenses are provided, then the concurrent user license should be a perpetual license to permit the use of the licensed software on a concurrent basis (limited to the number of simultaneous users of the licensed software) and such concurrent user license should not be conditional upon any Terms and conditions not set out expressly in the Contract. The Vendor should provide in the licensed software a utility to manage the list of users who are sharing the concurrent user license(s) and provide a mechanism within the licensed software to ensure that the contracted number of concurrent user license(s) is made available for users. The City may add to the number of users who can share the concurrent user license(s) at any time without notice to the Vendor and without any fee or other charges being due to the Vendor.
- .6 If named user licenses are provided, then the named user license should be a perpetual license to permit one (1) individual to use the licensed software and such named user license should not be conditional upon any Terms and conditions not set out expressly in the Contract. The City may transfer the named user license from one (1) individual to another individual at any time or times without notice to the Vendor and without any fee or other charges being due to the Vendor;
- .7 The Vendor should have the exclusive title to the licensed software and Documentation or otherwise have the right to grant to the City each license and every right under to each licensed software and the Documentation as contemplated by the Contract without violating any third party Intellectual Property Rights;
- .8 Each licensed software and the Documentation should be free from all encumbrances, should not, and will not contain any Disabling Code;
- .9 The Documentation should be well written, readily understood, and contain clear and concise instructions for users and system administrators of the licensed software and should include meaningful instructions to enable users and systems administrators to take full advantage of all of the capabilities of the licensed software including installation and system administration documentation to enable a system administrator to allow proper control, configuration and management of the licensed software;
- .10 For the duration of the Warranty Period, the licensed software will perform in accordance with the specifications and descriptions contained in the Contract, in the Vendor's published Documentation and specifications, and in the Documentation for the version of the software in use by the City;

- .11 The licensed software should be compatible with future releases of the operating system on which it was originally installed within one hundred and twenty (120) calendar days of general availability of the operating system and shall be subsequently maintained to remain so compatible;
- .12 The Vendor shall provide to the City, without additional charge, copies of the licensed software and Documentation revised to reflect any enhancements made by the Vendor and such enhancements will be deemed to include all Versions, Releases and other modifications to the licensed software which correct errors, increase the speed, efficiency, capacity or ease of operation of the licensed software, or add additional capabilities or functions to or otherwise improve the capabilities and functions of the licensed software; and
- .13 The Warranty Period of licensed software shall commence on the Initial Install Date of such licensed software.
- .14 Each software license granted pursuant to the Agreement should survive any expiry or termination of the Agreement.

25

#### **SOFTWARE UPDATES**

- .1 The Successful Bidder shall provide all software updates and revisions to the City during the length of this contract term warranty period without cost to the City. The Successful Bidder must register and maintain all applicable Formal technical support agreements with manufacturers including but not limited to American Dynamics and Dedicated Micros, Milestones, BriefCam, Software House, CCURE9000, Key Tracer. Registration of the technical support agreements.
- .2 The Successful Bidder is responsible to maintain 100% functionality of the CCTV and AV Systems prior to and after scheduled updates are performed.
- .3 Where there is integration between City systems, the Successful Bidder must maintain integration compatibility and advise the City if software updates may impact the current integration performance and functionality.

26

#### **UPGRADES AND UPDATES**

- .1 Throughout the Contract Term and its Warranty period, the Successful Bidder shall provide notice to the Project Manager within 24-hours of all manufacturers' or software developer's release of a version, firmware, and/or patch upgrade and/or update for all security systems owned or operated by the City that pertains to this Contract.
- .2 The Successful Bidder shall include; without any additional costs to the City, all manufacturer and/or City of Toronto recommended application and operating system upgrades and updates including licenses, versions, firmware, hot fixes and patches to ensure continuous performance and continuity of City CCTV and AV Systems.
- .3 The Successful Bidder shall provide the City with all software upgrades and updates, in original packaging (where available), with original manuals/documentation, and original copies (compact discs, floppies, etc.).

27

#### **FUTURE SYSTEM EXPANSION**

- .1 The City reserves the right to have other qualified firms expand and/or add to the systems at any time.
- .2 The City reserves the right to make changes, alterations, additions, or deletions to any of the City's equipment.

28 **DELIVERY AND INSTALLATION**

- .1 The Vendor must deliver the specified Deliverables as per their Quotation without substitution or deviation. All items shall be delivered F.O.B. Destination.
- .2 The Successful Bidder must deliver the specified Products and/or Services as per their Quotation without substitution or deviation.
- .3 The Successful Bidder shall provide staff who are qualified to undertake the installation Services required under the Terms of this document. The staff must be certified to install and set-up the Products produced by the manufactures that are listed in the 33.0 Manufactures List.
- .4 The Successful Bidder shall restore all property temporarily removed, damaged, or destroyed during the supply, delivery, and installation, of Products to the satisfaction of the City and at no cost to the City. The Successful Bidder, before final payment, shall remove all surplus materials and any debris of every nature resulting from its operation and put the site(s) in a neat, orderly condition; thoroughly clean. If the Successful Bidder fails to clean up at the completion of the supply, delivery, and installation of the Products, then the City may do so and charge the Successful Bidder for the costs thereof, or deduct said costs from any monies still owing to the Successful Bidder.
- .5 The Successful Bidder shall furnish all labour, materials, Services, supplies, tools, equipment, apparatus, transportation, facilities and incidentals required and perform all operations necessary to accomplish the complete installation of the Product(s).
- .6 **Return of Products**
  - .1 Should the Product fail to work upon arrival, or within thirty (30) days of arrival, the Product will be returned for a complete exchange of new working Product (same make and model), at no cost to the City. The Product must be exchanged within five (5) business days of notification. The Warranty Period of the replaced Product will be deemed to date from the day of replacement.
  - .2 If the Product(s) do not function as warranted and the problem cannot be resolved to the satisfaction of the City, then the Product(s) may, at the sole discretion of the City, be returned for a full refund.
  - .3 In the event an item has been discontinued by the manufacturer/supplier, the supplier must provide documentation to confirm the product is no longer available and provide a viable substitute that meets or exceeds the current specifications at the same price.
  - .4 The Vendor will be responsible for all costs associated with the return and replacement of any products which have been discontinued. This will include all freight, packaging and handling costs.
  - .5 The City will not accept any changes related to the discontinued product. The City will not be responsible for any restocking charges associated with returns.
  - .6 Bidders must not substitute contract approved product(s), commodity(s) or service(s) without prior written approval from City of Toronto Purchasing and Materials Management staff, on either City of Toronto letter head or City of Toronto originating email. Any approved substitution must meet or exceed the approved good, approved commodity or approved service to be substituted, at no additional cost to the City of Toronto.

29 **WARRANTY**

- .1 The Successful Bidder shall include a two (2) year Warranty for all parts and labour as per the Warranty conditions of this document.
- .2 Warranty shall include all Preventive Maintenance for two (2) full year periods. This entails two site visits per warranty year.
- .3 If, within two (2) years after the date of final acceptance of the Work as determined by the Corporate Security Lead, or designated portion thereof, or within two (2) years after acceptance by the Corporate Security Lead of designated equipment, or within such longer period of time as may be prescribed by law, or by the Terms of any applicable special Warranty required by the contract, or applicable codes, any of the Work found to be defective or not in accordance with the contract, the Successful Bidder shall correct it after receipt of a written notice from the City to do so unless the City has previously given the Successful Bidder a written acceptance of such condition. This obligation shall survive termination of the contract. The City shall give such notice promptly after discovery of the condition.
- .4 All installed equipment, shall be subjected to its own Preventative Maintenance schedule; the schedule is to be submitted after final acceptance of equipment installation with the submitted as-builts. The Preventative Maintenance must be performed in accordance to NFPA 731 throughout the Warranty period, or a minimum of two times a warranty period whichever is greater, at no further cost to the City.
- .5 Nothing contained in the contract shall be construed to establish a period of limitation with respect to any other obligation that the Successful Bidder might have under the contract.
- .6 The establishment of the time period of two (2) years after the date of final acceptance, or such longer period of time as may be prescribed by law, or by the Terms of any Warranty required by the contract relates only to the specific obligation of the Successful Bidder to correct the Work, and has no relationship to the time within which its obligation to comply with the contract documents may be sought to be enforced, nor to the time within which proceedings may be commenced to establish the Successful Bidder's liability with respect to his obligations other than specifically to correct the Work.
- .7 If this contract in its specifications requires that specific deliverables must perform as a system, this representation and Warranty shall apply to the deliverables, individually, in combination with each other, and as a system. Where the Successful Bidder will be providing any component of a deliverable from or through a Subcontractor, the Successful Bidder shall cause its Subcontractor to comply with this representation and Warranty with respect to the component to be provided by such Subcontractor.
- .8 Where the deliverable being provided by the Successful Bidder has an interface with any other product and such interface is necessary for the functionality, operation or performance of its deliverable, the Successful Bidder shall ensure that such product complies with this representation and Warranty and such interface does not in any way impair the ability of its deliverable to comply with this representation and Warranty.
- .9 At the Corporate Security Lead's request made in writing at any time before or within 90 calendar days (or such other time period as designated by the City in writing) of its acceptance of the deliverable, the Successful Bidder will, at no charge to the City, demonstrate the compliance techniques and test procedures to be followed by the Successful Bidder or the City or its authorized agent to confirm that the deliverable complies with this representation and Warranty.
- .10 Where the Successful Bidder advises the City that its deliverable is not able to comply with this representation and Warranty at this time but will be able to do so by a specified date, the City may at its sole discretion accept the deliverable on the condition that there is

compliance by the specified date; however, the City is not obligated or liable to make payment for the deliverable until such condition is satisfied.

- .11 In the event of any breach of this Warranty and representation, the remedies available to the City shall include but not be limited to:
  - .1 The Successful Bidder restoring the deliverable to the same level of performance as represented and warranted herein;
  - .2 The Successful Bidder repairing or replacing the deliverable with a deliverable conforming with this representation and Warranty;
  - .3 The Successful Bidder granting or securing for the City or its authorized agent permission to make any modifications necessary to make the deliverable compliant with this representation and Warranty and arranging for any necessary waivers of moral rights or other intellectual property rights to make such modifications; and
  - .4 The Successful Bidder granting the City or its authorized agent access to the source code for the information technology used in the deliverable in order to make any modifications necessary to make the deliverable compliant with this representation and Warranty or securing for the City the necessary permission for such access and arranging for any necessary waivers of moral rights or other intellectual property rights to make such modifications, in each case, so as to minimize interruption to the City's ongoing business processes, with time being of the essence, and to be done at the Successful Bidder's sole expense.
- .12 The Successful Bidder represents and warrants that any restoration, repair or replacement made will not corrupt any data of the City or introduce any viruses into the City's system. The Successful Bidder agrees that any modification made pursuant to subparagraph 30.5 or 30.6, above, is the property of the City, including all copyright and other intellectual property rights pertaining thereto.
- .13 This Warranty shall survive cancellation or other termination of this contract.
- .14 Nothing in this representation and Warranty shall be construed to limit any rights or remedies (including indemnities) otherwise available to the City under this contract or at law or equity; and nothing in the contract shall limit the scope of this representation and Warranty and any rights or remedies set out herein, and, in particular, no waiver or disclaimer set out in such agreement (or made otherwise) shall operate to limit the Successful Bidder's liability under this representation and Warranty.
- .15 In the event that the Successful Bidder fails to make good such defects within a stipulated time, the City reserves the right to have the Work performed by other qualified suppliers. All costs incurred by the City are to be paid by the Successful Bidder.
- .16 The Successful Bidder after the date of final acceptance of all work/orders as determined by the City, or designated portion thereof, provide, in addition to the Warranty Certification a preventative Maintenance schedule for the duration of the Warranty period.
- .17 The Successful Bidder shall complete all manufacturer Warranty registration for applicable Products as per the Warranty Terms purchased and provide proof of registration to the City within 30 calendar days of installation.

30

#### **WARRANTY SERVICE**

- .1 The Successful Bidder shall provide and maintain its call center telephone number(s) and call placement procedures to City of Toronto Corporate Security and the SCC for dispatching Personnel for warranty services. The telephone number(s) must be a local

(Toronto) 10 digit number. The City will not accept any number that results in long distance charges for the City when placing a call from the City of Toronto.

- .2 The Successful Bidder's Call Centre telephone number(s) must be answered by a live operator and available during Daytime hours (06:00-18:00hrs, Monday through Friday), excluding statutory holidays.
- .3 The Successful Bidder must also maintain an email address for warranty service requests. Automated email responses are not acceptable.
- .4 The Successful Bidder shall provide contact lists (one list for during daytime hours and a separate list for afterhours) to ensure the required warranty service resolution times are met.

31 **SERVICE CALLS**

- .1 The technician must report to the work site, diagnose the issue and provide a corrective maintenance solution of the initial call for corrective maintenance services. The Vendor must obtain a work order from the City Designated that details the products and number of labour hours required prior to ordering Products and performing any warranty services resulting from the service call.
- .2 Upon arrival at the location, the technician must notify the Corporate Security Control Centre by phone at 416-397-0000;
- .3 Upon departure of the location, the technician must notify the Corporate Security Control Centre by phone at the end of each day, by email to [SecSysSD@toronto.ca](mailto:SecSysSD@toronto.ca), and provide a required, future steps to be taken.

32 **SERVICE CALLS**

The Warranty Service Call Priority	Resolution Time
(1) Urgent	48 HOURS
(2) High	Five (5) Business Days

33 **PASS-THROUGH WARRANTIES**

- .1 The Successful Bidder will, to the extent permissible, agrees to pass through to the City of Toronto any warranties given by its third party vendors in connection with hardware, software or other products or services used by the Successful Bidder to provide the Services to the extent permitted by the terms and conditions of such warranties and pass through to the City of Toronto all available warranties and provide all available (including extended) applicable original equipment manufacturer and additional warranties for third party Equipment used to provide the Services. The Successful Bidder will obtain and pass through to the City of Toronto any warranties required by the specifications for Equipment procured on behalf of the City of Toronto. The Successful Bidder will, to the extent permissible, pass through to the City of Toronto all available warranties and provide all available (including extended) applicable original equipment manufacturer and additional warranties for Equipment owned by the City of Toronto.
- .2 The Successful Bidder shall secure from the applicable Equipment or third party Software manufacturers, and assign and pass through to the City of Toronto, at no additional cost to the City of Toronto, such warranties as may be available with respect to such Equipment and Software. Such assignment shall not, however, relieve the Successful Bidder of any of the warranty obligations contained herein. In the event such warranties are not assignable

to the City of Toronto, the Successful Bidder shall enforce, as necessary, such warranties on behalf of the City of Toronto.

- .3 In the event that Contractor purchases Goods or Materials in its own name for incorporation in the Work delivered to the City of Toronto, and the Successful Bidder receives a warranty from the vendor of such Goods or Materials, the Successful Bidder shall ensure that such warranty is passed through to, and is enforceable by, the City of Toronto.

34

#### **COMPLIANCE WITH STANDARDS**

- .1 The Successful Bidder shall maintain a high level of workmanship and comply with the following codes, standards and procedures. Bidders that have completed and submitted the Confidentiality Agreement will be provided with copies of the City of Toronto standards listed below at the Mandatory Site Meeting.

## Declaration of Compliance with Anti-Harassment/Discrimination Legislation & City Policy

Organizations/individuals in Ontario, including the City of Toronto, have obligations under the Ontario Human Rights Code, the Occupational Health and Safety Act, the Employment Standards Act, the Accessibility for Ontarians with Disabilities Act, the Criminal Code of Canada and the Charter of Rights and Freedoms. In addition, the City of Toronto also has policies that prohibit discrimination on the additional grounds of political affiliation or level of literacy, subject to the requirements of the Charter. Organizations are required to have and post policies, programs, information, instruction, plans and/or other supports, and an **appropriate** internal process available to their employees and service recipients to prevent, address and remedy discrimination, racism, harassment, hate and inaccessibility complaints under the applicable legislation and including the additional grounds of discrimination prohibited under City policy. Individuals are obliged to refrain from harassment/hate activity.

The City of Toronto requires all organizations and individuals that contract with the City to sign the following Declaration of Compliance with Anti-Harassment/Discrimination Legislation & City Policy. This Declaration must be signed by your organization and submitted with the contract or Letter of Understanding. The name of your organization and the fact that you have signed this declaration may be included in a public report to City Council.

### Declaration:

I/we uphold our obligations under the above provincial and federal legislation. In addition, I/we uphold our obligations under City policies which prohibit harassment/discrimination on a number of grounds including political affiliation and level of literacy.

WHERE LEGALLY MANDATED I/we have in place the necessary policies, programs, information, instruction, plans and/or other supports that are consistent with our obligations, and I/we have an internal process available to my/our employees and service recipients to prevent, address and remedy discrimination, racism, harassment, hate and inaccessibility complaints. I/we agree that I/we shall, upon the request of the City, provide evidence of the policies, programs, information, instruction, plans and other supports and an appropriate internal complaint resolution process required under this Declaration which is sufficient to allow the City to determine compliance. I/We acknowledge that failure to demonstrate compliance with this declaration to the satisfaction of the operating Division, in consultation with the City Solicitor, may result in the termination of the contract.

Human Resources Policies  
**Workplace Violence (2019)**

Category: Health and Safety  
Sub-Category: General

**Policy Statement**

The City of Toronto is committed to working with its employees to provide a safe work environment. The City will not tolerate any acts of violence and will take all reasonable and practical measures to prevent violence and protect employees from acts of violence. Appropriate remedial, disciplinary, and/or legal action will be taken according to the circumstances.

**Purpose of Workplace Violence Policy**

This policy is supported by the Guidelines for Implementing the Workplace Violence Policy, a Workplace Violence and Threat Report form, a Supervisor Checklist for Workplace Violence, and an information sheet. The policy and its supporting guidelines are intended to:

1. Maintain a work environment free from workplace violence
2. Provide a definition of workplace violence
3. Identify the responsibilities of the workplace parties to maintain a workplace free of actual, attempted or threatened violence
4. Establish measures and procedures for summoning immediate assistance when workplace violence occurs or is likely to occur
5. Establish measures and procedures for workers to report incidents of workplace violence and for the City to investigate and deal with incidents or complaints immediately
6. Provide guidance to divisions on establishing their Workplace Violence program

**Application**

*The Workplace Violence policy applies under any circumstances in which City employees experience workplace violence, as defined below. It applies to all employees, contractors of the City, volunteers, students, clients of City services, any person engaged in business with the City, and visitors to City properties.*

*The City's Human Rights and Anti-Harassment Policy should be consulted regarding issues of personal harassment and harassment related to discrimination and inequitable work practices.*

**Definitions**

For the purpose of this policy, violence includes:

- the exercise of physical force by a person against a worker, in a workplace, that causes or could cause physical injury to the worker
- the exercise of physical force by a person against another person, in a workplace, that causes or could cause physical injury to the worker
- an attempt to exercise physical force against a worker that could cause physical injury to the worker
- a statement or behaviour that it is reasonable for a worker to interpret as a threat to exercise physical force against the worker, in a workplace, that could cause physical injury to the worker

*The City's Human Rights and Anti-Harassment Policy addresses harassment or intimidation (e.g., behaviours that demean, embarrass, or humiliate and are known or would be expected to be unwelcome).*

**Responsibilities**

All employees are responsible for preventing and reporting acts of violence that threaten or perceive to threaten a safe work environment.

**Divisional senior management will ensure that:**

- A divisional workplace violence program is established
- Reasonable preventative measures are undertaken to protect employees and others in City workplaces from workplace violence
- Take reasonable preventative measures to protect employees and others in City workplaces from workplace violence
- Ensure that a process for centralized tracking and review of workplace violence incidents is established and implemented
- Ensure that workplace violence risk assessments are completed, reviewed, revised when needed and reported
- Post this policy in a conspicuous location in each workplace
- Establish and maintain a process for reporting and responding to incidents of violence
- Ensure that the process for reporting and responding to incidents of violence is communicated, maintained and followed
- Ensure that this policy is reviewed at least annually

**Managers/supervisors will:**

- Understand and uphold the principles of this policy
- Communicate this policy and its guidelines to all employees
- Conduct workplace violence risk assessments to determine whether the nature of the workplace, the type of work or conditions of work may place employees at risk of violence
- Consult with Joint Health & Safety Committees (JHSCs)/OHS Representatives, assigned People, Equity & Human Rights (PEHR) /divisional health & safety staff , and where appropriate, Corporate Security, in conducting risk assessments, and develop practical measures and procedures to control identified risks
- Take all reasonable and practical measures to minimize or eliminate risks identified through the risk assessment process, workplace inspections, or the occurrence of a workplace violence incident
- Review risk assessments at least annually, as well as when there are changes to the nature of the workplace, the type of work or the conditions of work. Revise the assessment, as needed
- Conduct further risk assessments when an increase in the number or severity of workplace violence incidents is noted to ensure that appropriate measures are in place to minimize or eliminate risks
- Communicate the results of workplace violence risk assessments and measures to minimize or eliminate risks to staff.
- Provide results of risk assessments (initial and updated) to joint health and safety committees/health and safety representatives
- Maintain and follow the process in the City's *Investigation and Reporting of Work-Related Injuries and Incidents policy* for reporting, investigating, documenting, and debriefing incidents of violence
- Respond promptly when an employee reports being subjected to, witnessing, having knowledge of workplace violence or having reason to believe that workplace violence may occur and take appropriate action.
- Address immediately all incidents of workplace violence, and not condone or permit any behaviour contrary to this policy. Exceptions to this must be clearly defined in the divisional procedures, describing specific behaviours that are unacceptable (e.g., unacceptable behaviours among a specific client group such as young children or clients with developmental, cognitive, or psychiatric disabilities). This exception must be communicated to staff but must not

- condone behaviours contrary to this policy.
- Ensure that all known incidents of workplace violence are investigated. To the extent appropriate based on the nature of each incident and the actual or potential threat it posed to worker safety:
    - consult with other parties (e.g., Corporate Security, Health & Safety staff, JHSCs/OHS Representatives, Employee Health and Rehabilitation, Employee Assistance Program, Human Rights Office, Toronto Police Services)
    - take all reasonable and practical measures to minimize or address risks identified by the incident
    - document the incident, its investigation, and corrective action taken
    - promptly share the results of the investigation and corrective actions taken with the joint health and safety committee/health and safety representative and the workers involved in the incident
  - Ensure workers are made aware of their rights to:
    - have workplace violence incidents investigated when they are reported
    - report incidents of physical assault or threats of physical assault to the police
    - support from management when reporting incidents of physical assault or threats of physical assault to the police (e.g. time for interactions with the police and making accessible to the police information in the employer's possession with respect to the incident)
  - Take all reasonable and practical measures to protect workers, acting in good faith, who report workplace violence or act as witnesses, from reprisal or further violence
  - Take every precaution reasonable in the circumstances for worker protection if they become aware, or ought reasonably to be aware, that domestic violence that would likely expose a worker to physical injury may occur in the workplace
  - Review annually, in conjunction with review of risk assessments, the effectiveness of actions taken to minimize or eliminate workplace violence and make improvements to divisional procedures, as required
  - Provide information to workers, including appropriate personal information, related to a risk of workplace violence from a person with a history of violent behaviour
  - Provide workers with information and instruction appropriate for the worker on the City's workplace violence policy and program

**People, Equity & Human Rights (PEHR)/ Divisional Occupational Health and Safety staff will:**

- Assist management to implement this policy, develop divisional procedures, and initiate the annual review of the policy and guidelines

**Joint Health and Safety Committees/OHS Representatives will:**

- Review the Workplace Violence Risk Assessment results and provide recommendations to management to reduce or eliminate the risk of violence
- Review all reports forwarded to the JHSC regarding workplace violence and other incident reports as appropriate pertaining to incidents of workplace violence that result in personal injury or threat of personal injury, property damage, or police involvement
- Participate in the investigation of critical injuries (e.g., incidents that place life in jeopardy, result in substantial blood loss, fracture of leg or arm, etc.)

- Recommend corrective measures for the improvement of the health and safety of workers
- Respond to employee concerns related to workplace violence and communicate these to management
- Participate in the review of the policy and guidelines for continuous improvement

In addition, JHSCs/OHS Representatives may participate in the investigation of reported incidents that result in personal injury or have the potential to result in injury.

**The Occupational Health and Safety Coordinating Committee will:**

- Review annually the effectiveness of the policy and guidelines and make changes as required by consulting with management staff and employee representatives

**All employees will:**

- Maintain a safe work environment, whenever possible
- Not engage in or ignore violent, threatening, intimidating or other disruptive behaviours
- Report promptly and provide details to their supervisor (or the appropriate alternative listed in the attached guidelines) any incident where the employee is subjected to, witnesses, or has knowledge of workplace violence, or has reason to believe that workplace violence may occur

**Reprisal**

This policy prohibits reprisals against individuals, acting in good faith, who report incidents of workplace violence or act as witnesses. Management will take all reasonable and practical measures to prevent reprisals, threats of reprisal, or further violence. Reprisal is defined as any act of retaliation, either direct or indirect.

## **City of Toronto**

### **Acceptable Use of Information Technology Assets Policy**

#### **1. Policy Statement**

- 1.1 The City of Toronto provides Authorized Users with access to the City's Information Technology Assets to be used for the purpose of conducting legitimate business activities and advancing the goals and objectives of the City of Toronto.
- 1.2 This Policy establishes principles and requirements for the acceptable use of the City's Information Technology Assets.

#### **2. Definitions**

- 2.1 **Accountability Officer(s)** refers to the Auditor General, Integrity Commissioner, Lobbyist Registrar and the Ombudsman at the City of Toronto.
- 2.2 **Authorized Users** are all individuals who have been granted access to the City's Information Technology Assets. This includes, but is not limited to, employees, consultants, contractors, subcontractors, individuals on secondment to the City, students and volunteers at the City of Toronto and Accountability Officers and anyone working or volunteering for or in their Offices subject to Section 3-10 F(5), Chapter 3, Accountability Officers, of the Toronto Municipal Code.
- 2.3 **Confidential Information** includes, but is not limited to, privileged information, draft by-laws or staff reports, third party information, personal information, technical or financial or scientific information and any other information collected, obtained or derived for or from City records that must or may be kept confidential under the *Municipal Freedom of Information of Privacy Act*, the *Personal Health Information Protection Act, 2004* or the *City of Toronto Act, 2006*.
- 2.4 **Information Technology Assets** are any system, service, hardware, and network assets that are owned by or supplied to Authorized Users by the City. This includes, but is not limited to, desktop computers, monitors, printers, notebooks, mobile devices, digital projectors, scanners, storage devices, networks and network devices, software, internet access, email, communication and business applications, telephones and voice mail, facsimile machines, and photocopiers.
- 2.5 **Systems Monitoring** refers to monitoring the City's Information Technology Assets used by Authorized Users for the collection and review of aggregate,

broad-based, or statistical data to assess, maintain, update or ensure reliability, security, confidentiality and integrity of City's Information Technology Assets. Systems monitoring is not directed at an identifiable individual(s).

- 2.6 **User Monitoring** refers to recording, accessing and reviewing or analyzing one or more identified Authorized User's activity on, or use of, the City's Information Technology Assets.

### 3. Application

- 3.1 This Policy applies to all Authorized Users with access to any of the City's Information Technology Assets.
- 3.2 Accountability Officers are responsible for the application of and compliance with this Policy in their Offices, including user monitoring where required, pursuant to Chapter 3, Accountability Officers, of the Toronto Municipal Code.
- 3.3 Exceptions
- 3.3.1 This Policy does not apply to Members of Council or anyone working or volunteering for or in their offices. Council Members are governed by the Code of Conduct for Members of Council, the Human Resources Management and Ethical Framework for Members' Staff, and applicable City policies and protocols.

### 4. Principles

- 4.1 The City's Information Technology Assets are corporate resources and are to be used in accordance with this Policy and other applicable City of Toronto by-laws, policies and relevant federal and provincial legislation.
- 4.2 Authorized Users shall exercise good judgment and responsibility when using the City's Information Technology Assets.
- 4.3 The City's Information Technology Assets shall be used in an ethical and professional manner.
- 4.4. The City's Information Technology Assets will be used in a manner that safeguards the integrity, privacy and confidentiality of the City's assets, information, and data.
- 4.5 Authorized Users are responsible for their use of the City's Information Technology Assets at all times, including non-business hours.

- 4.6 Authorized Users shall not expect absolute privacy when using the City's Information Technology Assets, including such limited personal use as permitted in accordance with Section 7 of this Policy.
- 4.7 Authorized Users shall not have any expectation that any use of City's Information Technology Assets, including limited personal use, is exempt from Systems Monitoring and/or User Monitoring in accordance with this Policy.
- 4.8 Each Authorized User's Manager or Supervisor shall ensure that the Authorized User is aware of and understands their role and responsibility under this Policy and related City by-laws, policies and relevant provincial and federal legislation.

## **5. User Accountability and Responsibility**

### **5.1 Security**

- 5.1.1 Authorized Users are to exercise good judgment and reasonable care in protecting Information Technology Assets from theft, damage or illegal access and against systems designed to disrupt, damage or place excessive load on the assets.
- 5.1.2 Authorized Users are responsible for safeguarding, protecting, and not sharing password(s) used to access the City's Information Technology Assets.
- 5.1.3 Any breach to the security of City's information technology systems or damage to or loss of Information Technology Assets will be immediately reported by the Authorized User to the I&T Service Desk and their Supervisor/Manager.

### **5.2 Information Management**

- 5.2.1 All Authorized Users are responsible for the proper management of information in accordance with related provincial and federal legislation, and City of Toronto by-laws and policies referenced in Section 11 of this Policy.
- 5.2.2 Authorized Users must protect confidential information that belongs to the City, its service users, residents, partners or vendors, in accordance with the requirements of relevant provincial, and federal legislation, contractual restrictions, and related City of Toronto by-laws, and policies.

- 5.2.3 When conducting City business, Authorized Users are responsible for maintaining an accessible record and information in accordance with City by-laws, policies and relevant provincial and federal legislation.
- 5.2.4 All information, records and data related to City business and created or legally acquired using the City's Information Technology Assets must be stored on the City's network server or on an Information Technology Asset owned or under contract to the City.
- 5.2.5 Authorized Users are encouraged not to use system, service, hardware, and network assets not owned by or supplied by the City for the performance of the Authorized User's duties and responsibilities. Authorized Users shall not, under any circumstances, use any system, service, hardware, and network assets not owned by or supplied by the City for the performance of the Authorized User's duties and responsibilities where such use:
- 5.2.5.1 compromises the security of the City's Information Technology Assets;
  - 5.2.5.2 results in a breach of provincial or federal legislation, or of the City of Toronto by-laws and policies referenced in Section 11 of this Policy;
  - 5.2.5.3 results in the release of confidential information that belongs to the City, its service users, residents, partners or vendors, contrary to the requirements of relevant provincial and federal legislation contractual restrictions, or related City of Toronto by-laws and policies; and/or
  - 5.2.5.4 results in the City incurring any unauthorized costs associated with Authorized Users accessing the City's network remotely.
- 5.2.6 Authorized Users who elect to use system, service, hardware, and network assets not owned by or supplied by the City for the performance of the Authorized User's duties and responsibilities may, through such use, make the system, service, hardware, and network assets used for this purpose subject to provincial and federal access to information legislation contractual restrictions, and related City of Toronto by-laws and policies, and shall cooperate with the City in fulfilling any resultant obligations that arise from such use.
- 5.2.7 Authorized Users who elect to use system, service, hardware, and network assets not owned by or supplied by the City for the performance

of the Authorized User's duties and responsibilities shall ensure that information, records, and data created, accessed, acquired, managed, or reviewed through such use is moved to and stored on the City's Information Technology Assets at the first available opportunity, following which it is deleted from the system, service, hardware, and network assets not owned by or supplied by the City.

### 5.3 Remote Access

- 5.3.1 Authorized Users with remote access to the City's network must connect using authorized methods and systems and ensure that the Information Technology Asset or the system, service, hardware, and network assets not owned by or supplied by the City is safe to use and will not negatively impact the City's network.
- 5.3.2 Authorized Users must maintain the privacy, confidentiality and integrity of corporate business information accessed through remote access.
- 5.3.3 All corporate information produced, accessed, or altered through remote access must be stored on the City's network or on an Information Technology Asset owned or under contract to the City.
- 5.3.4 The City will not incur any unauthorized costs associated with Authorized Users accessing the City's network remotely.
- 5.3.5 The City retains the right to terminate Authorized Users' remote access at any time.

## 6. Ownership

### 6.1 Assets

- 6.1.1 The City's Information Technology Assets are the sole property of the City of Toronto.
- 6.1.2 All Authorized Users must provide, when requested by management or delegated staff, any Information Technology Asset.

### 6.2 Information and Records

- 6.2.1 All information and records created or legally acquired using the City's Information Technology Assets are the sole property of the City of Toronto with the exception of records which arise from the permitted

personal use of Information Technology Assets in accordance with Section 7.

## **7. Personal Use**

- 7.1 Reasonable and limited personal use of Information Technology Assets is permitted, provided that it:
- 7.1.1 Does not interfere with the Authorized User's duties and responsibilities.
  - 7.1.2 Is lawful and in compliance with applicable City of Toronto by-laws and policies, and relevant federal or provincial legislation.
  - 7.1.3 Does not compromise the security of the City's Information Technology Assets.
  - 7.1.4 Is not used for private gain, whether monetary or non-monetary, or advancement or the expectation of private gain.
  - 7.1.5 Does not result in the City incurring an expense unless it is incurred in accordance with the Business Expense Policy.
- 7.2 Authorized Users are responsible for properly managing personal files. The City is not liable nor will it incur any expense to protect or back-up personal files.
- 7.3 Authorized Users are encouraged to not store their own personal information or personal files on the City's Information Technology Assets. Users that elect to store their own personal information or personal files acknowledge that they are doing so at their own risk.

## **8. Unacceptable Use of Information Technology Assets**

- 8.1 Unacceptable use of the City's Information Technology Assets includes, but is not limited to:
- 8.1.1 Using the City's Information Technology Assets to access or carry out any activities that are obscene, lewd, or pornographic.
  - 8.1.2 Using the City's Information Technology Assets to carry out any activities that are harassing, embarrassing, discriminatory or defamatory to another individual, employee, or group, or that are in breach of the employee's duty of fidelity to the City of Toronto.

- 8.1.3 Using Information Technology Assets to carry out any activities that contravene federal, provincial legislation and City of Toronto by-laws and policies.
- 8.1.4 Activities that will interfere with the normal operations of the City's Information Technology Assets, including intercepting or altering information transmitted.
- 8.1.5 Violating terms of applicable software licensing agreements or intellectual property laws, including installing software without a license.
- 8.1.6 Disclosing or distributing confidential information without authorization or contrary to City policies and by-laws and relevant federal or provincial legislation.
- 8.1.7 Circumventing the City's security schemes and protection.
- 8.1.8 Unauthorized use, infringement, theft, reconfiguration, movement, or relocation of City's Information Technology Assets and/or data, information or records located on the City's Information Technology Assets.

## **9. Monitoring**

### **9.1 Systems Monitoring**

- 9.1.1 The City of Toronto has the right to conduct Systems Monitoring at any time, at will and in its sole discretion, including the right to filter and quarantine both inbound and outbound content, as may be necessary to protect the integrity, security, confidentiality, or reliability of the City's Information Technology Assets.
- 9.1.2 As part of System Monitoring, the City of Toronto may recover deleted files and data stored or accessed using the City's Information Technology Assets.

### **9.2 User Monitoring**

- 9.2.1 The City of Toronto reserves the right, but does not have a duty, to conduct User Monitoring.
- 9.2.2 The City may exercise its right to perform User Monitoring:

9.2.2.1 If in the opinion of the City Solicitor there are reasonable grounds and/or a reasonable belief based on credible information received to support User Monitoring, including but not limited to information or belief that:

- i. An Authorized User is violating this Policy or other City of Toronto by-laws and policies, or any relevant federal and provincial legislation in their use of the City's Information Technology Assets.
- ii. An Authorized User is using the City's Information Technology Assets in a fashion incompatible with the User's employment with the City or grant of access to the City's Information Technology Assets.
- iii. The results from general Systems Monitoring provide reasonable grounds to focus on and review a specific Authorized User's activity.

9.2.2.2 In the alternative, if necessary to:

- i. protect and maintain the City's Information Technology Assets or other assets and interests from an immediate or imminent threat.
- ii. support the City of Toronto's efforts to comply with legal requirements, or defend itself in proceedings.

9.2.2.3 For other legitimate business, corporate or human resources purposes, including as a result of the absence of an employee.

9.2.3 User Monitoring pursuant to Section 9.2.2, User Monitoring, will be conducted in accordance with the User Monitoring Procedures referenced in Section 11.1.11, and the following principles:

9.2.3.1 If effective alternatives to User Monitoring are available in identifying inappropriate use or responding to a legitimate business, corporate, or human resources purpose, they shall be employed.

9.2.3.2 The least intrusive but effective means of User Monitoring shall be used.

- 9.2.3. Results of User Monitoring shall remain confidential, subject to the requirements of the investigation (including matters arising from the investigation), and/or other City by-laws, policies and relevant provincial and federal legislation.
- 9.2.3.4 Any decision to prosecute or refer User Monitoring or investigation results to the Toronto Police Service or other regulatory agencies for independent investigation will be made in accordance with the Toronto Public Service By-law, Chapter 192, Public Service of the Toronto Municipal Code.
- 9.2.4 User Monitoring by any individual for private or personal interest, curiosity, or without cause and appropriate authorization is prohibited and shall be considered a violation of this Policy.
- 9.3 Section 9.2 of this Policy does not apply to Accountability Officers when user monitoring is necessary as part of the fulfillment of their statutory mandate and responsibilities under Part V of the *City of Toronto Act, 2006*.
- 9.3.1 In circumstances, where an Accountability Officer is conducting user monitoring for their own Office or their staff, the Accountability Officer is responsible for applying Section 9.2 as deemed appropriate by the Accountability Officer.

## 10. Compliance

- 10.1 Failure to comply with this Policy may result in disciplinary action up to and including dismissal and/or legal proceedings where warranted.
- 10.2 In an event of a conflict or difference the federal and provincial legislation supersedes this Policy.
- 10.3 This Policy supersedes other City or divisional policies, standards and guidelines that govern the use of Information Technology Assets in an event of conflict or difference, subject to the principle that specific provisions of the other policies, standards, and guidelines continue to apply despite a more general provision being set out in this Policy.
- 10.4 This Policy shall be reviewed every three to five years and the City reserves the right to amend this Policy at any time.

## **11. Related By-Laws, Policies and Procedures**

**11.1** This Policy is to be implemented and interpreted with other related by-laws and policies, including:

## Corporate Security

### Confidentiality and Non-Disclosure Declaration (NDA) Form

**CITY OF TORONTO**  
**CONFIDENTIALITY AND NON-DISCLOSURE DECLARATION**  
**("Confidentiality Agreement")**

**THIS ACKNOWLEDGEMENT AND DECLARATION** is given to the City of Toronto (the "City") as of the \_\_\_\_ day of \_\_\_\_\_, 20\_\_ by \_\_\_\_\_ (the "Company").

**AND WHEREAS** the City requires the Company to enter into this Confidentiality Agreement and abide by the following terms and conditions;

**NOW THEREFORE** for sufficient and valuable consideration received from the City, including the disclosure of certain Confidential Information, the Company agrees and declares as follows:

1. In this Confidentiality Agreement, "Confidential Information" means all information of any kind, including correspondence and documentation, which comes to the attention of the Company in connection with or arising out of this Confidentiality Agreement.
2. The Company shall maintain the absolute confidentiality of all Confidential Information and agrees not to disclose any Confidential Information to any third party, with the exception of those listed in Appendix A, for any reason whatsoever without the express written consent of the City.
3. The Company shall ensure all parties listed in Appendix A execute the Secondary Confidentiality Agreement listed in Appendix B prior maintain the absolute confidentiality of all Confidential Information and agrees not to disclose any Confidential Information to any third party, with the exceptions of, for any reason whatsoever without the express written consent of the City.
4. The Company shall maintain the security and integrity of Confidential Information in the possession or control of the Company, and shall keep such Confidential Information in a physically secure location(s) to which access is restricted.
5. The Company shall only utilize information technology that has received the prior approval of the City for the storage, receipt and transmission of the Confidential Information.
6. The Company agrees it may disclose Confidential Information only to those of its representatives who need access to the Confidential Information for the purpose of carrying out their services and on the condition that all such Confidential Information be retained by each of those representatives as strictly confidential.
7. The Company shall not have, or acquire, any right, title or interest, including intellectual property rights, in such Confidential Information, which shall remain the property of the City.
8. The Company acknowledges that the City has disclosed the Confidential Information to the Company solely in connection with carrying out its services. The Company acknowledges and agrees that unauthorized dealings with the Confidential Information would be detrimental to the interests, business and affairs of the City.

9. Upon request by the City, the Company agrees to promptly deliver, or destroy as directed by the City, the Confidential Information, together with all copies, extracts or other reproductions in whole or in part of such Confidential Information. In addition, at the City's request, the Company will destroy, promptly and irrevocably, all such copies, extracts or other reproductions of Confidential Information that exists in a form that cannot be delivered to the City.
10. The Company acknowledges and agrees that the City will be entitled to injunctive and other equitable relief to prevent or restrain breaches of any of the provisions of this Confidentiality Agreement by the Company or any of its representatives, or to enforce the terms and provisions hereof, by an action instituted in a court of competent jurisdiction, which remedy or remedies are in addition to any other remedy to which the City may be entitled at law or in equity.
11. The Company acknowledges that no delay or failure by the City in exercising any rights, powers, remedies or privileges available to it hereunder shall operate as a waiver thereof.
12. The Company confirms it has read and agreed to all the terms and conditions of this Confidentiality Agreement in full and to be bound by such.

IN WITNESS WHEREOF the Company executes this Confidentiality Agreement through the signature of its duly authorized signatory.

Appendix A – Permitted Third Parties

{List of subcontractors, suppliers, etc. to be inserted}

**CITY OF TORONTO**  
**CONFIDENTIALITY AND NON-DISCLOSURE DECLARATION**  
**("Secondary Confidentiality Agreement")**

**THIS ACKNOWLEDGEMENT AND DECLARATION** is given to the City of Toronto (the "City") as of the \_\_\_\_ day of \_\_\_\_\_, 20\_\_ by \_\_\_\_\_ (the "Company").

**AND WHEREAS** the City requires the Company to enter into this Confidentiality Agreement and abide by the following terms and conditions;

**NOW THEREFORE** for sufficient and valuable consideration received from the City, including the disclosure of certain Confidential Information, the Company agrees and declares as follows:

1. In this Confidentiality Agreement, "Confidential Information" means all information of any kind, including correspondence and documentation, which comes to the attention of the Company in connection with or arising out of this Secondary Confidentiality Agreement.
2. The Company shall maintain the absolute confidentiality of all Confidential Information and agrees not to disclose any Confidential Information to any third party, for any reason whatsoever without the express written consent of the City.
3. The Company shall maintain the security and integrity of Confidential Information in the possession or control of the Company, and shall keep such Confidential Information in a physically secure location(s) to which access is restricted.
4. The Company shall only utilize information technology that has received the prior approved of the City for the storage, and receipt of the Confidential Information.
5. The Company agrees it may disclose Confidential Information only to those of its representatives who need access to the Confidential Information for the purpose of carrying out their services of the Contract and on the condition that all such Confidential Information be retained by each of those representatives as strictly confidential.
6. The Company shall not have, or acquire, any right, title or interest, including intellectual property rights, in such Confidential Information, which shall remain the property of the City.
7. The Company acknowledges that the City has disclosed the Confidential Information to the Company solely in connection with carrying out its services. The Company acknowledges and agrees that unauthorized dealings with the Confidential Information would be detrimental to the interests, business and affairs of the City.
8. Upon request by the City, the Company agrees to promptly deliver, or destroy as directed by the City, the Confidential Information, together with all copies, extracts or other reproductions in whole or in part of such Confidential Information. In addition, at the City's request, the Company will destroy, promptly and irrevocably, all such copies, extracts or other reproductions of Confidential Information that exists in a form that cannot be delivered to the City.

9. The Company acknowledges and agrees that the City will be entitled to injunctive and other equitable relief to prevent or restrain breaches of any of the provisions of this Confidentiality Agreement by the Company or any of its representatives, or to enforce the terms and provisions hereof, by an action instituted in a court of competent jurisdiction, which remedy or remedies are in addition to any other remedy to which the City may be entitled at law or in equity.
10. The Company acknowledges that no delay or failure by the City in exercising any rights, powers, remedies or privileges available to it hereunder shall operate as a waiver thereof.
11. The Company confirms it has read and agreed to all the terms and conditions of this Confidentiality Agreement in full and to be bound by such.

IN WITNESS WHEREOF the Company executes this Confidentiality Agreement through the signature of its duly authorized signatory.

| .14 | ASME A17.1/CSA B44 | - | Safety Code for Elevators and Escalators  |

1.3 **SYSTEM DESCRIPTION**

.1 Single Stage Fire Alarm System

- .1 System shall be electrically supervised, zoned as indicated on Drawings and designed so that actuation of any manual pull station, smoke detector, heat detector or group of these devices in a zone shall cause the signal bells to sound throughout building. All magnetic door locks and/or door strikes to be deactivated, cause fans to shutdown as indicated, and transmit signal to fire department. Alarm shall indicate on appropriate zone light at control panel.

- .2 Wiring shall be done in class A configuration such that an open circuit in any initiating device shall not prevent alarms from being received by other devices. Each zone shall have its own alarm and trouble lamp.
  - .3 Complete system to be supervised against failure of operating power, open circuits, and grounds. All supervision is to be maintained on all circuits even in event of a power failure, when system is on battery standby. Any of above causes a Sonalert to sound at main control panel and at each remote annunciator and also light a common trouble lamp in same panels. Sonalert to produce a tone distinct from tone of alarm signals. Provide a silencing switch in main control panel, which, when operated, silences trouble bell but causes trouble lamp to remain illuminated until trouble is cleared and system returned to normal. Upon return to normal, trouble signal lamp shall be automatically reset to normal.
  - .4 Provide common control panel containing a system reset button, a system silence push button, and an LED test button. It shall not be possible to reset system until all operated initiation devices have been returned to normal. Failure of a lamp on the supervised annunciator causes a common trouble indication and causes annunciator trouble LED to light. The common control also to contain a signal silence push button. This signal silencing push button is used to silence alarm signals at any time but, if a new alarm should occur after it is pressed, all alarm signals shall again sound. When an alarm is received, the zone LED shall flash, until it has been silenced. At this time the LED indicator shall illuminate continuously. Upon receipt of a subsequent alarm, the LED for that zone shall flash, indicating in which zone the latest alarm occurred.
- .2 Two Stage Fire Alarm System
- .1 The system shall be electrically supervised, zoned as indicated on Drawings and designed so that actuation of any manual pull station, smoke detector, heat detector or group of these devices in a zone shall cause signal bells to sound throughout building, all magnetic door locks and/or door strikes to be deactivated, and cause fans to shutdown as indicated. Alarm shall indicate on the appropriate zone light at control panel.
  - .2 On receipt of an alarm from any zone, bells shall ring at twenty strokes per minute. In the event of a real fire, a general evacuation alarm can be initiated by means of a key switch in each one of the double action stations. If original alarm is not acknowledged within five minutes, general evacuation alarm shall sound automatically by means of a timer in control panel. General evacuation alarm consists of bells ringing at one hundred twenty strokes per minute.
  - .3 Wiring shall be done in class A configuration such that an open circuit in any initiating device shall not prevent alarms from being received by other devices. Each zone shall have its own alarm and trouble lamp.
  - .4 Complete system to be supervised against failure of operating power, open circuits, and grounds. Any of the above causes a Sonalert to sound at main control panel and at each remote annunciator and also light a common trouble lamp in the same panels. Sonalert to produce a tone distinct from tone of alarm signals. Provide a silencing switch in main control panel, which, when operated, silences trouble bell but causes trouble lamp to remain illuminated until trouble is cleared and system returned to normal. Upon return to normal, trouble signal lamp shall be automatically reset to normal.
  - .5 Provide common control panel containing a system reset button, a system silence push button, and an LED test button. It shall not be possible to reset

system until all operated initiation devices have been returned to normal. Failure of a lamp on the supervised annunciator causes a common trouble indication and causes annunciator trouble LED to light. The common control panel also to contain a signal silence push button. This signal silencing push button is used to silence alarm signals at any time but, if a new alarm should occur after it is pressed, all alarm signals shall again sound. When an alarm is received, the zone LED shall flash until it has been silenced. At this time the LED indicator shall illuminate continuously. Upon receipt of a subsequent alarm, the LED for that zone shall flash, indicating in which zone the latest alarm occurred.

.3 Multiplex Fire Alarm System

- .1 Supervised, non-coded, annunciated, (single) (two) stage, closed circuit, twenty-four volt AC/DC multiplexed fire alarm (and security) system. (The system shall provide dual channel voice communication and firefighter phone capabilities. Both voice communication system and firefighter phone system shall be an integral part of fire alarm system).
- .2 The Central Processing Unit (CPU) shall use multiplex communication techniques to receive data from and transmit data to transponders which shall be remotely located throughout facility to minimize wiring costs, simplify design, and allow economical expansion and easy retrofit. (Multiplex communication techniques shall also be used for emergency voice circuits, and firefighter's phones located throughout building.)
- .3 The CPU shall be microprocessor-based to increase system reliability, speed response to alarm conditions, and reduce cost. CPU response time to alarm conditions shall be no more than four seconds, regardless of system size.
- .4 Fire alarm stations, thermal detectors, products of combustion detectors, (emergency evacuation speakers, emergency telephones) shall be fully supervised.
- .5 Upon operation of any manual station or detector, the following will occur:
  - .1 Actuate CPU to cause (signal bells to sound at twenty strokes per minute) (a slow rate tone on emergency evacuation speakers) throughout building. Second stage alarm can be initiated by means of a key switch in each of the double action stations. If original alarm is not acknowledged within five minutes, system automatically enters into second stage alarm which consists of (the bells ringing at one hundred twenty strokes per minute) (a high rate tone on emergency evacuation speakers).
  - .2 Initiate alarm origin on CPU and at graphic annunciator.
  - .3 Shut down air supply and return air fans.
  - .4 Transmit signal to fire department.
  - .5 Deactivate all magnetic door locks and/or door strikes.
  - .6 Activate smoke dampers.
- .6 CPU shall indicate trouble when any fault occurs within the system (or CRT and keyboard).

2.1 **ACCEPTABLE MANUFACTURERS**

- .1 Simplex Grinnell
- .2 Siemens Building Technologies
- .3 Notifier
- .4 Mircom
- .5 Chubb/Edwards

2.2 **MATERIALS**

- .1 Control Panel
  - .1 Control panel shall be housed in a (free-standing) (wall-mounted) cabinet of code gauge construction with baked enamel finish, full viewing window and hinged front door cover complete with lock and two keys. Opening cabinet door shall provide access to all operating controls, but will not expose live electrical connections.
  - .2 Control panel, with number of zones as shown on zone schedule containing the following:
    - .1 Reset button, LED test button, alarm signal silencing push button, ground fault indicator light, system trouble indicating light, trouble signal silencing button and annunciator trouble indicating light.
    - .2 Relays and control modules as required for door releases, fan shut-down, extinguishing system release and audible alarms.
    - .3 Alarm receiving modules for number of zones as indicated on Drawings. Zone modules shall be capable of handling any type of device including pull stations, smoke detectors, and heat detectors to allow for future changing of devices without changing modules. Each module to contain a trouble alarm indicator.
    - .4 Power supply modules as required.
    - .5 Valve supervision module as required.
    - .6 Signal control modules as required.
    - .7 Fire department connection plug-in module complete with disconnect switch and LED "disconnect" indicator.
    - .8 All modules shall have visual supervision against removal.
    - .9 A standby power module shall be provided consisting of lead calcium sealed batteries connected with sufficient amp hour capacity to operate the alarm devices under supervisory condition with AC power disconnected for twenty-four hours and at the end of this period, operate the alarm devices for thirty consecutive minutes. Note that on battery standby all building wiring must be supervised, and give an immediate trouble indication on battery backup when any problem occurs within the system. The batteries shall be sealed maintenance free type with expected life in excess of five years. Batteries shall be enclosed in a steel housing. A fully automatic battery charger shall be provided which shall be capable of restoring 90% of a dead batteries capacity within

twenty-four hours. The battery shall be protected against excessive discharge by automatically disconnecting battery from system when voltage of battery drops to 60%.

.2 Central Processing Unit (CPU)

- .1 Central processing unit shall come complete with alphanumeric display, keyboard and printer. Alphanumeric display and printer shall be fully operational while system is operating on standby batteries.
- .2 CPU shall be housed in (flush mounted) (surface mounted) (free standing) cabinet with sufficient capacity to allow maximum system expansion and to house alphanumeric display and printer (audio system microphone) (master firefighter phone).
- .3 The CPU electronics shall be microprocessor-based. Basic life safety software shall be retained in erasable programmable read only memory (EPROM). CPU shall have special software available in which to make changes on a temporary basis in control by event programming, and also in custom printer labels. This field editing is to enhance flexibility of the system. CPU shall be equipped with software in order to handle \_\_\_\_\_ monitor points, and \_\_\_\_\_ control points, and have ability to annunciate all of aforementioned points, including an additional \_\_\_\_\_ trouble points dedicated to system supervision. All indicators and software shall be in place within the CPU.
- .4 System shall be multi-channel allowing a minimum of \_\_\_\_\_ monitor points per channel. One or two channels may be used for system. Each channel shall operate independently. Faults on one channel shall not affect operation of the other. System wiring requirements shall be one pair of wires per channel for data communication, two pairs for zoned dual channel audio transmissions, and one pair for a fully supervised and zoned firefighter phone system.
- .5 CPU shall be equipped with a real time output for the purpose of synchronizing clocks.
- .6 CPU shall display both alarm and trouble indication from each fire alarm zone, where each zone can be a device. The system shall indicate the exact location and description of activity.
- .7 As a result of alarm conditions received at the CPU, the system shall have ability to automatically operate specified control points such as tripping municipal box to summon fire department, or stopping exhaust fans or air conditioning units and releasing magnetically held doors and other fire alarm related devices.
- .8 System shall be equipped with a communication input/output "port" to allow use of commercially available remote printers, cathode ray tubes (CRT), and keyboards.
- .9 Multiplex system shall be equipped with standby batteries to provide system operation and vital fire/security protection during commercial power outages. It shall also have provisions to operate an LED annunciator to provide a simple lamp type status indicator for critical system functions. These annunciators shall be operable from the system communication circuits (same wiring used to communicate with transponders), eliminating the need for special wiring.
- .10 CPU shall be designed for use with transponders. Transponders shall have the capability to interface with all specified peripheral devices, such as smoke and

thermal detectors, door holders, (speakers). Communication between CPU and transponders shall be one twisted shielded pair.

- .11 Voice communication system shall be an integrated dual channel system for use in fire alarm and emergency paging. Voice communication system shall have ability to sound an evacuation tone in one area of building, over that areas' speakers, while at the same time being able to sound a first stage alert tone or voice message to other parts of the building.
- .12 Voice communication system shall provide intelligible low level reproduction and incorporate one way voice communication to each floor or compartment of building for selected evacuation and/or one way voice communication to all or any combination of floor or compartments for mass evacuation. Wiring to voice communication transponders shall be one shielded twisted pair from CPU to voice transponders.

.3 Transponders

- .1 Transponder shall be capable of directly running two-wire ionization or photoelectric smoke detectors and shall supervise detector and signalling circuits in accordance with class "A" requirements. Unit shall be a combination of alarm monitor points, control points, supervised signalling circuits, and one detector reset point and shall respond to signal silence and detector reset commands manually initiated at CPU operator's panel.
- .2 Transponders shall use microprocessor based electronics to ensure reliability. Sensing circuits to peripheral devices shall be supervised to provide an indication of sensing circuit faults. Sensing circuit supervision shall not reduce available system monitor points. Sensing circuits shall be capable of working with normally (open) (closed) contacts and shall detect the following conditions: open line, alarm, normal and ground.
- .3 Transponders shall contain the zones as indicated on schedules, and shall be used for monitoring fire alarm zones, sprinkler zones, sprinkler tamper zones, (security zones), (and for monitoring and controlling emergency telephone zones), (and paging zones). Transponders shall also be used for controlling door holders, fan shutdown, and damper circuits.

.4 Demarcation Terminal Box

- .1 A suitable terminal box to be provided as the point of demarcation between the fire alarm control unit and the signal transmitting unit.
- .2 Alarm, trouble and supervisory contacts shall be extended from the fire alarm control unit to the demarcation terminal box.

.5 Alarm Initiating Devices

- .1 Thermodetectors:
  - .1 Fixed temperature thermal detectors shall be of (fast action fusible) (automatic reset) type, rated at (135°F (57°C)) (200°F (93°C)) (with status LED for visual supervision). (Detector shall be addressable).
  - OR-
  - .2 Thermal detectors operating on rate-of-rise and fixed temperature principles shall be sensitive to a temperature rise greater than or equal to 15°F (8°C) per minute or rate fixed temperature of (135°F (57°C)) (200°F

(93°C)) (with status LED for visual supervision). (Detector shall be addressable).

.2 Smoke detectors:

- .1 Ionization smoke detector shall be self-compensating dual chamber type activated by products of combustion. The unit shall be plug-in, mounted to a twist/lock base complete with solid-state amplifier-switching circuit and status LED for visual supervision. (Detector shall be addressable).

-OR-

- .2 Ionization smoke detector shall be self-compensating dual chamber type activated by products of combustion. Detector shall contain internal chamber cover and pre-selected fixed sensitivity for use in high air velocity applications. Unit shall be plug-in, mounted to a twist/lock base complete with solid-state amplifier-switching circuit and status LED for visual supervision. (Detector shall be addressable).

-OR-

- .3 Photoelectric smoke detector shall be a photoelectric detection chamber type activated by light scattering of smoke particles. Unit shall be plug-in, mounted to a twist/lock base complete with status LED for visual supervision. (Detector shall have an integral fixed temperature heat detector rated at 135°F (57°C)). (Detector shall be addressable).

.3 Duct detectors:

- .1 Ionization duct detector shall be dual chamber type with housing and air sampling tubes for detection of combustion products and/or smoke. Provisions shall be made for local or remote indicator lamp and/or auxiliary relay. (Detector shall be addressable).

-OR-

- .2 Photoelectric duct detector shall be solid state photodiode type with housing and air sampling tubes for detection of smoke using light scattering. Provisions shall be made for local or remote indicator lamp and/or auxiliary relay. (Detector shall be addressable).

.4 Manual stations:

- .1 Single action station shall be non-coded (flush) (surface) mounted type consisting of a molded housing with pull-down lever and keylock switch to test and reset. Alarm switch shall be of (N/O) (N/C) sealed contact type and come complete with a normally closed auxiliary contact. (Manual station shall be addressable).

-OR-

- .2 Double action station shall be non-coded (flush) (surface) mounted type consisting of a molded housing with (push-in tab) (break glass), pull-down lever action and key lock switch to test and reset. Alarm switch shall be (N/O) (N/C) sealed contact type and come complete with a normally open auxiliary contact. (Manual station shall be addressable).

.6 Signalling Devices

- .1 Bells shall be of (single stroke) (vibrating) polarized type, (flush) (surface) mounted, red in colour, for operation on (24V DC) (120V AC) audible circuit supply. Bells shall be complete with (150 mm gong) (250 mm gong) (chimes).

- .2 (Horns) (Sirens) shall be of polarized type, (plug-in) (flush) (surface) mounted, red in colour, for operation on (24V DC) (120V AC).
- .3 Speakers shall be 200 mm, of permanent magnet cone type and have an impedance of eight ohms. Speaker shall include a multiple tap transformer (one-quarter, one-half, one, two, and four watts). Frequency response at full rated power shall be 50-80,000 Hz. Baffles shall be fabricated of steel, finished in flat white baked enamel.
- .7 End-of-Line Resistors
  - .1 End-of-line resistors shall be mounted on a stainless steel plate and bear a ULC label.
- .8 Door Holders
  - .1 Door holders shall be magnetic type, (wall) (floor) mounted, with approximately 16 kg holding power, for operation on (12V DC) (24V DC) (24V AC) (120V AC).
- .9 Remote Alarm Indicators
  - .1 Remote alarm indicators shall be (wall) (ceiling) mounted and shall provide remote indication of a specific detector using an electrical connection. Unit shall consist of a red (LED) (lamp) on a mounting plate.
- .10 Remote Test Station
  - .1 Remote test station shall provide testing of a detector and indication of an alarm condition at a remote location. Unit shall consist of a key test switch and a red (LED) (lamp) mounted on a single gang plate.
- .11 Graphic Building Plan
  - .1 Graphic plan to be a wall mounted pictorial representation of the building indicating building outline with fire detection zones. Graphic plan shall indicate separately all levels, with appropriate zones showing exit doors, stairwells and elevators. Graphic plan to be engraved on acrylic material and installed beside annunciator panel depicting proper orientation. Annunciator location to be engraved in red.

### 3 Execution

#### 3.1 **INSTALLATION**

- .1 Conductors shall be solid copper. The minimum size of conductor shall be:
  - .1 16 AWG for individual conductors.
  - .2 18 AWG for integral assembly of two or more conductor cables.
  - .3 14 AWG for control and audible signal circuits. In no case shall the voltage drop exceed 10%.
- .2 All wiring within enclosures to be identified with wire markers and termination on terminal strips. Wiring entering and exiting control enclosures shall be laid on terminal strip. Splicing of wiring is not acceptable.
- .3 Wiring entering or leaving building to be provided with lightning protection. Surge protection to be installed in junction box at floor level. Label box as "fire system surge protection".

- .4 Class A wiring shall be used for all alarm initiating devices.
- .5 Class B wiring shall be used for all notification appliances circuits.
- .6 Power to be provided by 120V AC.
- .7 Provide (EMT) (rigid) conduits with (steel set screw fittings with nylon insulated thread) (rigid coupling) as manufactured by T & B or approved equal. Size conduits to code requirements or larger sizes where indicated.
- .8 Terminal cabinets shall be 460 x 610 mm type "T" with wood back, door within the trim complete with latch and lock.
- .9 Outlet box for audible and visible devices to be a single gang, masonry box unless indicated otherwise and shall be flush mounted so that the top of the device will not be less than 2.3 m above the finished floor level in all areas with finished ceilings. In all other areas, outlet boxes shall be 100 mm square surface mounted 2.3 m above finished floor.
- .10 Wall-mounted visible signal devices shall be installed such that the entire lens is not less than 2 m and not more than 2.4 m above the finished floor.
- .11 Outlet boxes for manual stations shall be a single gang masonry box unless indicated otherwise and shall be flush mounted not less than 1.2 m and not more than 1.4 m above finished floor level to centre of box in all areas with finished ceilings. In all other areas, outlet boxes shall be flush mounted if possible.
- .12 The top of fire alarm annunciator or display and control centre legend or operating control shall be mounted not more than 1.8 m from finished floor level.
- .13 Should interference from obstructions, lamp positions or heat radiating surfaces be encountered in locating any fire alarm device where shown, the device shall be located as near as possible to indicated position, clear of obstacles, to the satisfaction of Consultant.
- .14 Detectors shall be ceiling mounted unless otherwise specified herein, at the highest point where variations in ceiling height exist and shall not be mounted on sides or underside of beams, joists, ducts, open web steel joists or any structure, etc. projecting more than 100 mm below ceiling level.

### 3.2 **VERIFICATION**

- .1 Manufacturer shall make an inspection of fire alarm equipment, including those components necessary to direct operation of system. Inspection shall comprise an examination of such equipment for the following:
  - .1 Person(s) carrying out verification to be CFAA certified or equivalent.
  - .2 That the type of equipment installed is that designated by the Consultant's Specifications.
  - .3 That wiring connections to all equipment components show that the installer undertook to have observed ULC and CSA requirements.
  - .4 The equipment of manufacturer's manufacture has been installed in accordance with manufacturer's recommendations, and that all signalling devices of whatever manufacture have been operated or tested to verify their operation; and
  - .5 That supervisory wiring of those items of equipment connected to a supervised circuit is operating and that governmental regulations, if any, concerning such supervisory wiring, have been met to the satisfaction of inspecting officials.

- .6 Manufacturer will supply to Contractor reasonable amounts of technical assistance with respect to any changes necessary to conform Work to paragraphs above. During period of inspection by manufacturer, Contractor shall make available to manufacturer, electricians as designated by manufacturer.
- .2 On completion of inspection and when all of above conditions have been complied with, manufacturer shall issue to Consultant:
  - .1 A copy of inspecting technician's report showing location of each device and certifying test results of each device.
  - .2 Inspection report to be in the format as laid out in CAN/ULC S537 Appendix C.
  - .3 A certificate of verification confirming that inspection has been completed and showing conditions upon which such inspection and certification have been rendered.
  - .4 Proof of liability insurance for the inspection.

### 3.3 **DEMONSTRATION**

- .1 Engage a manufacturer's service representative to provide startup service and to demonstrate and train Owner's personnel for the following:
  - .1 On procedures and schedules related to startup and shutdown.
  - .2 Silencing of alarms, resetting of control panel.
  - .3 Isolating of individual detectors or areas.

End of Section

1 General

1.1 **SUMMARY**

.1 Section Includes

- .1 Labour, Products, equipment and services necessary to complete the Work of this section.

1.2 **REFERENCES**

.5 Occupational Safety and Health Act; Ministry of Labour of Ontario

.6 Local municipal by-laws

1.3 **PROJECT CONDITIONS**

.1 Site Visit

- .1 Visit the Site and determine the work extent and nature of existing conditions. In no circumstances will any claims against the Owner be allowed resulting from failure to ascertain the work herein described or implied.
- .2 Report to Consultant, in writing, any conditions which will prejudice the proper completion of the Work. Commencement of Work constitutes acceptance of existing conditions.
- .3 It must be noted that soil conditions between boreholes may be at variance with the information shown on borehole data. Borehole data is issued for information only.

.2 Protection

- .1 Establish locations of service installations existing in the areas of work and obtain service Owners' approval to work in such areas. Provide adequate markers or

take protective measures to ensure that no damage is caused under the work of this section. Repair damaged Work as required without cost to Owner.

- .2 Notify Consultant and obtain clearance to proceed prior to commencement of Work.
- .3 Temporarily cover existing catchbasins and manholes exposed to construction traffic to prevent entry of earth or debris.
- .4 Provide all necessary hoardings, guardrails, markers, including temporary warning lights, or other means required, to ensure that no damage, injury or death is caused to persons or damage to property resulting from this work.
- .5 Protect existing trees, shrubs, and plants to remain.
- .6 Protect the work of other Contracts in progress or completed and protect the Owner's properties, stored Products, services and utilities from damage.

.3 Environmental Requirements

- .1 Dust control: Provide and maintain, to the Consultant's satisfaction, adequate system to avoid any nuisance caused by dust and dirt rising throughout the area of operations.
- .2 Silt control: Provide and maintain, to Consultant's satisfaction, control systems to prevent silt from entering any storm drainage system.

1.4 **SUBMITTALS**

- .1 Hazardous materials: Provide description of hazardous materials and notification of filing with proper authorities prior to beginning Work, as required.

1.5 **DELIVERY, STORAGE AND HANDLING**

.1 Waste Management and Disposal

- .1 Divert excess materials from landfill to site approved by Consultant.
- .2 Source separate for recycling materials that cannot be salvaged for reuse including wood, metal, concrete and asphalt, and gypsum.
- .3 Remove materials that cannot be salvaged for reuse or recycling and dispose of in accordance with applicable codes at licensed facilities.

1.6 **SITE CONDITIONS**

.1 Site Environmental Requirements

- .1 Ensure that the work does not adversely affect adjacent watercourses, groundwater and wildlife, or contribute to excess air and noise pollution.
- .2 Do not dispose of waste of volatile materials including but not limited to, mineral spirits, oil, petroleum based lubricants, or toxic cleaning solutions into watercourses, storm or sanitary sewers.
  - .1 Ensure proper disposal procedures are maintained throughout the Project.
- .3 Do not pump water containing suspended materials into watercourses, storm or sanitary sewers or onto adjacent properties.

.4 Control disposal or runoff of water containing suspended materials or other harmful substances as directed by Consultant.

.5 Protect trees, plants and foliage on site and adjacent properties where indicated.

1.7 **ACCESS ROADS**

.1 Maintain access roads used for hauling operations clean and as required by municipal authorities.

2 **Products**

2.1 **NOT APPLICABLE**

3 **Execution**

3.1 **DEMOLITION/REMOVALS**

.1 Demolish/remove existing curbs, sidewalks, paving and granular base, bumper rails and posts and as shown.

.2 Break out and remove existing asphalt (concrete) pavement within the confines of the work. Prior to breaking out, saw cut cut-off point to avoid damage to remaining pavement.

.3 Demolish sidewalk, curb, pavement, and various other existing works within the confines of the Contract or as designated on Drawings.

3.2 **RESTORATION**

.1 Restore areas and existing works outside areas of demolition to match condition of adjacent, undisturbed areas at no extra cost to the Contract.

.2 Use soil treatments and procedures which are not harmful to health, are not injurious to plants, and do not endanger wildlife, adjacent watercourses or ground water.

3.3 **CLEANING**

.1 Remove debris, trim surfaces and leave Work Site clean upon completion of work.

.2 Use cleaning solutions and procedures that are not harmful to health, are not injurious to plants, and do not endanger wildlife, adjacent watercourses or ground water.

3.4 **DISPOSAL OF WASTE AND SURPLUS MATERIALS**

.1 Except where specified or indicated on Drawings to be retained on site for reuse, remove from the site and legally dispose of, all waste and surplus materials resulting from Site preparation work on a daily basis.

End of Section

(THIS PAGE INTENTIONALLY LEFT BLANK)

1 General

1.1 **SUMMARY**

.1 Section Includes

- .1 Labour, Products, equipment and services necessary to complete the work of this Section.

1.2 **REFERENCES**

.1 Conform to the latest edition of the following:

- .1 ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort
- .2 ASTM E1643 - Standard Practice for Selection, Design, Installation, and Inspection of Water Vapor Retarders Used in Contact With Earth or Granular Fill Under Concrete Slabs
- .3 ASTM E1745 - Standard Specification for Plastic Water Vapor Retarders Used in Contact With Soil or Granular Fill Under Concrete Slabs
- .4 CSA-A23.1 - Concrete Materials and Methods of Concrete Construction
- .5 CAN/ULC-S701 - Thermal Insulation, Polystyrene, Boards and Pipe Covering
- .6 OPSS 1010 - Ontario Provincial Standard Specification, Material Specification for Aggregates - Base, Subbase, Select Subgrade, and Backfill Material
- .7 MOE - Ministry of the Environment of Ontario

1.3 **LINES AND LEVELS**

- .1 Establish lines and elevations from existing lines and elevations shown on Drawings.
- .2 Have necessary lines and levels established by a registered Ontario land surveyor or a qualified registered Civil Engineer.
- .3 Indicate location of building walls relative to property lines on survey plan.
- .4 Protect and maintain the lines and benchmarks as long as they are required.

1.4 **ACCESS ROAD CLEANING**

- .1 Keep access roads clear of mud, debris and dirt resulting from Work of this section.

1.5 **SUBMITTALS**

- .1 Submit a certificate issued by fill Supplier to substantiate that fill materials are free of contaminants.
- .2 If well pointing is required, submit, in accordance with Section 01 33 00, location of piping layout and depth of penetration below water table, for Consultant's review.
- .3 Submit manufacturer's Product data and mix design information of unshrinkable fill to confirm Product conformance to Specifications.

## 1.6 **QUALITY ASSURANCE**

### .1 Testing and Inspection

- .1 Be responsible for granular/soil materials, placing and compaction throughout the Work of this Contract as it progresses and on completion to ensure specified materials, placing and required compaction densities are obtained.
- .2 Owner may appoint a third party independent testing company at its own expense for checking or approval of the Contractor's material placing and compaction Work. Pay charges for re-testing after making good defective areas. Coordinate construction schedule with Consultant so that Owner's testing company can be notified in advance.
- .3 Provide the following and pay for all associated costs as part of the Contract:
  - .1 Retain an independent, well established and qualified commercial testing agency to, a) maintain field quality control operations such as compaction tests, and, b) perform material testing in the laboratory and prepare test reports and other submittals. Testing agency shall have enough personnel and resources to perform a) and b) in a timely manner.
  - .2 The testing agency personnel shall be qualified and have had experience on projects equal to the complexity of this Project. Upon request from the Owner, submit qualifications of the testing agencies and include their personnel for approval prior to retaining either one of the agencies.
  - .3 The Owner reserves the right to request change in personnel or testing agency at any time.
  - .4 Submit proposed material, including off-site borrow material, to the testing agency for its analysis and report, in sufficient time so as not to delay the progress of the Work. The testing agency shall approve all fill material prior to placement and shall observe placement to ensure lift thickness is as specified.
  - .5 Testing agency shall submit, in duplicate, test report which includes tests, investigations, findings and recommendations to the Contractor and to the Owner, within twenty-four hours of the tests.
  - .6 For field quality control of operations, testing agency shall determine the compaction of material placed and shall conduct the following minimum number of in-place density tests after monitoring the placing and compacting of each lift.
    - .1 For mass filling: One test per lift of fill for each one hundred square metres.
    - .2 Floor subgrade: One test per final lift (subgrade) or fill or backfill within building wall lines, for each five hundred square metres, both after compaction and before slab construction.
    - .3 For trenches: Three tests per lift of trench backfill for each one hundred fifty linear metres.
  - .7 If compaction tests indicate that a layer has not been brought to the required compaction, re-compact the area, prior to placement of additional material, until the required compaction is obtained. If the layer has been covered by a subsequent operation, remove such material before re-compacting the defective layer.

- .4 Submit a testing and inspection program to account for all the items specified above. Submit to the Consultant at pre-construction meeting or prior to start of construction.
- .2 Cementitious backfill materials will be tested for conformance to the Specifications by an independent inspection company selected and paid for by Owner. Tests include the following:
  - .1 Obtaining certification of cements.
  - .2 Cylinder test. Three test cylinders will be taken from initial pour.
- .3 Cooperate with and assist Owner's inspection/testing company's personnel during inspections and tests.
- .4 Remove defective materials and completed work which fails tests and replace as directed by Consultant.
- .5 Where work or materials fail to meet strength requirements as indicated by test results, pay costs of additional inspection and testing required for new replacement work or materials.

#### 1.7 **PROJECT CONDITIONS**

- .1 Cultural Heritage Resources
  - .1 If cultural heritage resources (such as archaeological sites, artifacts, building and structural remains, and/or human burials) are encountered during performance of Work, contact Consultant immediately and suspend Work in immediate area until assessment has been completed by Ministry of Culture, Tourism and Recreation. Perform required measures to mitigate negative impacts on found resources to acceptance of Consultant.
- .2 Protection
  - .1 Existing buried utilities and structures:
    - .1 Prior to commencing excavation, establish locations of existing buried service installations in the construction area. Notify service owners and obtain their approval to work in such areas. Place adequate markers and take protective measures to ensure that no damage is caused under the work of this section. Repair damaged Work as required at no change in Contract Price.
    - .2 Temporarily cover local existing catchbasins and manholes exposed to construction traffic to prevent entry of earth or debris.
  - .2 Excavations:
    - .1 Erect necessary hoardings, guardrails, markers; place temporary warning lights; take all other measures required to ensure that no damage or injury is caused to persons, or damage to property resulting from this Work.
    - .2 Protect excavations and maintain warning devices during construction and during time when Work is closed down for any cause.
  - .3 Other contracts, existing buildings and surface features:

- .1 Protect work of other trades or of other contracts in progress or completed and protect Owner's existing properties, stored Products, services and utilities from damage.

## 2 Products

### 2.1 MATERIALS

- .1 Granular materials - general: New materials conforming to OPSS 1010, free of organic matter, imported from off-site, and sourced from a member of the Aggregate Producers Association of Ontario. Note: The use of slag and recycled aggregates is prohibited.
  - .1 Backfill: OPSS Granular "B Type I"
  - .2 Sub-base: OPSS Granular "B Type I"
  - .3 Base: OPSS Granular "A"
  - .4 Base under oil impregnated sand: Granular "A"
  - .5 Underfloor base: OPSS Granular "A" crushed limestone
- .2 Select fill: Native excavated site material approved by Consultant and capable of being compacted to required density and free of:
  - .1 Any vegetable or organic matter and roots
  - .2 Cinders or ashes
  - .3 Building debris
  - .4 Rocks and stones larger than 75 mm
- .3 Impervious fill: Fine grain material such as clay.
- .4 Drainage channel panels: "Miradrain 6000" by Mirafi or equivalent by Terrafix.
- .5 Oil Impregnated Sand Bed
  - .1 Sand: Imported natural concrete sand having clean, hard, strong, durable uncoated grains free from lumps, soft or flaking particles, shale, clay, organic matter and other deleterious substances.
  - .2 Oil: Petroleum based (engine) oil, to provide corrosion protection to steel tank bottom.
- .6 Drainage weepers, bedding and surround: Plastic pipe by Big-O or approved equivalent, Type 2 - perforated nominal inside diameter, and complete with a seamless and knitted polyester filter fabric sleeve, non-perforated pipe sections as required for collectors, and all fittings required for the work. Clean coarse aggregate conforming to CSA-A23.1, Table 3, Group 1 (20 to 5 mm).
- .7 Perimeter foundation insulation: Styrofoam "SM" by Dow Chemical Co. or "Celfort 300" by Owens Corning conforming to CAN/ULC-S701. Use Lepage "PL Premium" adhesive for use in conjunction with installation of perimeter insulation.
- .8 Unshrinkable fill: Ready mixed Product consisting of CSA-A5, Type 10 portland cement, CSA-A363 cementitious hydraulic slag, sand and water proportioned and mixed to produce a stable, self-levelling, controlled density fill with a compressive strength of 0.7 MPa at twenty-eight days. Cement content to be at 50 kg/m<sup>3</sup> of mix.

- .9 Vapour retarder: Minimum 0.25 mm10 mil (10 mils) thick sheet membrane conforming to ASTM E1745; Perminator by W.R. Meadows, Stego Wrap Vapor Barrier by Stego Industries or accepted equal.

- .1 Lap tape: 100 mm

## 2.2 **STOCKPILING OF GRANULAR MATERIALS**

- .1 Stockpile materials in a manner to prevent segregation.
- .2 Protect materials from contamination.
- .3 Separate different aggregates by strong, full-depth bulkheads, or stockpile far enough apart to prevent intermixing.
- .4 Do not use intermixed or contaminated materials. Remove and dispose of materials rejected by Consultant within forty-eight hours of rejection.
- .5 Stockpiling sites to be level, well drained, and of adequate bearing capacity and stability to support stockpiled materials and handling equipment.

## 3 Execution

### 3.1 **EXCAVATION**

- .1 Remove obstructions (ice and snow) from surfaces to be excavated.
- .2 Perform excavation with proper allowance for subsequent work including shoring, bracing and formwork (sheet piling and underpinning). Excavation shall be clean and clear of loose material and true to size. Underpin as shown on Drawings. Also, refer to geotechnical report.
- .3 Securely shore and brace sides of trenches and excavation exceeding 1.2 m in depth with shoring and bracing extending at least 300 mm above the top of trenches or excavation.
- .4 Do not obstruct flow of surface drainage or natural watercourses.
- .5 Excavate to undisturbed soil, level, free from loose, soft or organic matter, and of design bearing strength.
- .6 Perform excavation at or adjacent to existing structures or foundations in such a way that structures and foundations are not weakened or endangered in any way. Where it is required to excavate adjacent to an existing building, all fill under existing floor slabs must be contained.
- .7 If undisturbed soil or bedrock having the required bearing capacity is not encountered at footing depths indicated, determine the possible additional volume of excavation that will be required and obtain Consultant's instructions in writing to excavate to additional required depth.
- .8 Do not expose shale to weather in excavations and in any case, following inspection, cover with 50 mm of 15 MPa concrete within twelve hours after exposure.
- .9 Fill excavations for building foundations which are, through error, carried below the elevation shown or approved depth, with 15 MPa concrete, or as directed by Consultant, at no increase in Contract Price.
- .10 Notify Geotechnical Engineer when bottom of excavation is reached, and have same inspect excavation prior to resumption of Work.

### 3.2 **DEWATERING**

- .1 Keep excavated areas free from standing water using power operated mechanical equipment.
- .2 Protect open excavations against flooding and damage due to surface run-off.
- .3 Obtain letter of conditional approval from authorities having jurisdiction to dispose of groundwater into sewer drainage system. Apply for water disposal permit.
- .4 Keep excavations and trenches free of water throughout construction period.
- .5 Groundwater removal:
  - .1 Lower groundwater level and maintain at depth below lowest point of excavation to ensure a dry stable surface.
  - .2 Dewater to prevent loss of soil and maintain stability of sides and bottom of excavation and of adjacent structures.
  - .3 Dispose of water in conformance with applicable by-laws and in a manner not detrimental to public and private property, or portion of Work completed, or under construction.
  - .4 Supply and install flocculation tanks, settling basins, or other treatment facilities to remove suspended solids or other materials before discharging to sewers, water courses or drainage areas in accordance with authorities having jurisdiction. Perform testing on settlement tank discharge to confirm that effluent meets sewer bylaw requirements. Locate tanks to acceptable area determined by Consultant.
- .6 Surface water removal:
  - .1 Remove surface run-off in a manner that will prevent loss of soil and maintain stability of sides and bottom of excavation. Obtain Consultant's approval of dewatering method to be used.
  - .2 Discharge surface water into existing storm drainage system to acceptance of Consultant and local authorities.

### 3.3 **PERIMETER INSULATION**

- .1 Install insulation with spot daub application of adhesive to ensure tight contact to substrate and to prevent displacement during backfilling. Butt joints tight between boards.

### 3.4 **DRAINAGE CHANNEL PANELS**

- .1 Secure channel panels with galvanized stick clips with lock washers in accordance with drainage channel manufacturer's directions. Set clips with adhesive compatible with clip-receiving substrate.
- .2 Trim panels and overlap and interlock same. Cover joints and edges with fabric flap.

### 3.5 **DRAINAGE WEEPERS**

- .1 Place 100 mm minimum thick granular bedding and tamp to grade.
- .2 Ensure pipe interior and coupling surfaces are clean before laying. Lay pipe with perforations downward. Do not use shims to establish pipe slope. Protect pipe ends from damage and ingress of foreign materials.

- .3 Have Consultant approve installed pipe before placing backfill.
- .4 Place granular surround after pipe installation, 150 mm thick each side and 300 mm minimum over pipe. Place granular material by hand. Consolidate by hand tamping slightly to prevent pipe displacement.
- .5 Backfill balance of excavation with specified granular backfill.

### 3.6 **BACKFILLING**

- .1 Prior to backfilling, remove loose materials, debris, etc., from excavated areas. Do not place backfill on contaminated (or frozen) ground.
- .2 Do not use backfill material which (is frozen or which) contains ice, snow or debris.
- .3 Place granular material, grade and compact to levels which provide for superimposed work at levels shown.
- .4 Notify Consultant for inspection when backfill is complete to compacted levels indicated on Drawings.
- .5 Place granular backfill in layers not exceeding 200 mm in depth and thoroughly compact. Each layer shall be compacted and accepted before next layer is placed.
- .6 Backfill simultaneously on both sides of walls. Do not backfill until walls have reached their design strength.
- .7 Take necessary precautionary measures during compaction of fill adjacent to foundations, walls, drains, etc., that such items are not displaced from their proper location or damaged by compacting equipment. In the event damage or displacement occurs during filling or resulting from compaction of fill, correct same, to approval of Consultant, and at no increase in Contract Price.
- .8 Place select fill for backfill where shown in layers not exceeding 200 mm, with each layer thoroughly compacted.

### 3.7 **UNDERFLOOR GRANULAR SUB-BASE**

- .1 Prior to filling, remove loose materials, debris, etc., from areas to be filled. Do not place fill on contaminated (or frozen) ground.
- .2 Do not use fill material which (is frozen or) contains ice, snow or debris.
- .3 Proof roll existing earth sub-grade in order to identify inconsistencies or soft areas.
  - .1 If a soft area is encountered, promptly notify the Consultant and obtain his instructions in writing to rectify the soft area.
  - .2 Proceed with filling operations only after inconsistencies or soft areas have been rectified.
- .4 Place Granular "B" sub-base in loose layers not exceeding 200 mm to a compacted depth of 150 mm terminating as follows except where shown otherwise:
  - .1 For facilities with permanent, watertight enclosure installed prior to placing concrete:
    - .1 Terminate compacted granular sub-base 200 mm below underside of slab. This allows for 150 mm50 mm cushion to absorb bleed water from concrete allowing concrete to dry evenly on both sides.

- .2 For facilities that are not permanently enclosed with a watertight enclosure prior to pouring concrete:
  - .1 Terminate compacted granular sub-base 150 mm below underside of floor slab.

### 3.8 **UNDERFLOOR GRANULAR BASE**

- .1 Prior to filling, remove loose materials, debris, etc. from areas to be filled. Do not place fill on contaminated (or frozen) ground.
- .2 Do not use fill material which (is frozen or) contains ice, snow or debris.
- .3 Proof roll granular sub-base in order to identify inconsistencies or soft areas.
  - .1 If a soft area is encountered, promptly notify the Consultant and obtain his instructions in writing to rectify the soft area.
  - .2 Proceed with filling operations only after inconsistencies or soft areas have been rectified.
  - .3 Place Granular "A" crushed limestone base to a compacted thickness of 150 mm in loose layers not exceeding 200 mm.

### 3.9 **VAPOUR RETARDER**

- .1 Ensure that granular surface is smooth and free of sharp projections that could puncture vapour retarder.
- .2 Place vapour retarder under floor slabs to receive epoxy, urethane and floor finishes installed with adhesive and thin set mortar:
  - .1 Install vapour retarder in accordance with ASTM E1643 and as specified.
  - .2 Ensure there are no discontinuities in vapour retarder at seams and penetrations.
  - .3 Unroll with the longest dimensions parallel with the direction of concrete placement.
  - .4 Join sections of vapour retarder and seal penetrations in vapour retarder with mastic tape. Ensure vapour retarder surfaces to receive mastic tape are clean and dry.
  - .5 Ensure there is no moisture entrapment by vapour retarder due to rainfall or ground water intrusion.
  - .6 Immediately repair holes in vapour retarder with self-adhesive repair tape.
  - .7 Seal around pipes and other penetrations in vapour retarder with pipe boots in accordance with manufacturer's instructions.
  - .8 Protect vapour retarder from damage during installation of reinforcing steel and utilities and during placement of concrete slab or granular materials.
  - .9 Immediately repair damaged vapour retarder in accordance with manufacturer's instructions.
- .3 Vapour Retarder Location

- .1 If the structure is enclosed with a permanent, watertight enclosure prior to concrete placing, place a 50 mm compacted thickness of granular limestone screenings cushion on top of vapour retarder to underside of floor slab.
- .2 If the structure is not enclosed with a permanent, watertight enclosure prior to concrete placing, place the vapour retarder directly under the floor slab. Do not use cushion method.
- .3 In any case, extend vapour retarder 1 m into areas without vapour retarder.

**3.10 UNSHRINKABLE FILL**

- .1 Use at locations indicated (or where work area is too limited to permit proper granular material placing and compaction operations.)
- .2 Discharge fluid backfill directly from ready mix truck to points of usage. Place in uniform lifts and simultaneously on both sides of members being backfilled to equalize loading.
- .3 Consolidate fill with vibrators.
- .4 If piping occurs in area being backfilled, coordinate with pipe installer to ensure disturbance of pipe alignment during backfilling is prevented.
- .5 Use temporary plates to support traffic loads over cementitious fill.

**3.11 COMPACTION**

- .1 Use compaction equipment capable of obtaining required material densities.
- .2 Compaction Densities
  - .1 Granular materials: To 98% Standard Proctor Maximum Dry Density (SPMDD) in accordance with ASTM D698.
  - .2 Earth fill and earth subgrade: To 95% Standard Proctor Maximum Dry Density (SPMDD) in accordance with ASTM D698.
- .3 Shape and roll alternately to obtain smooth, even and uniformly compacted sub-base.
- .4 Apply water as necessary during compaction to obtain specified density.
- .5 In areas not accessible to rolling equipment, compact to specified density with power operated portable plate compactors.
- .6 Depth and layers specified are minimum dimensions of fill after compaction, except where loose layer is specified.
- .7 Ensure compaction operations do not cause vibration and noise levels exceeding acceptable limits established by authorities having jurisdiction.

**3.12 PROTECTION OF FILL AND BACKFILL**

- .1 Protect filled and backfilled areas against damage from any cause.

**3.13 DISPOSAL OF SURPLUS MATERIALS**

- .1 Remove from the site and legally dispose of excess excavated material, waste material, trash, debris and rubble.
- .2 Obtain and pay for all necessary regulatory approvals, consents and permits for disposal of surplus material.

OR

- .3 Deposit and spread excess excavated material on site where shown on Drawings.

End of Section

| .11 | CSA G30.15-M     | - Welded Deformed Steel Wire Fabric for Concrete Reinforcement   |

1.3 **SUBMITTALS**

.1 Submit Shop Drawings in accordance with Section 01 33 00.

.2 Submit as Shop Drawings, Product data, performance and other criteria for each material specified in this section that is proposed for use, including:

- .1 Admixtures
- .2 Joint filler
- .3 Joint sealant
- .4 Curing compound

- .3 Submit Shop Drawings of joint assemblies. Draw to a scale not smaller than 1:50 and include plans, sections and details.
- .4 Concrete Supplier's latest statistical analysis of all concrete mixes to be used on this Project.

1.4 **QUALITY ASSURANCE**

- .1 Acceptable concrete finishing contractors for dolly pads are Diplock Floor Ltd., Duron Ontario Ltd., or Metro Concrete Floors Inc.
- .2 Testing and Inspection
  - .1 Work will be inspected and tested for conformance to CSA-A23.1 by an independent inspection company selected and paid for by Owner.
  - .2 Notify Consultant at least twenty-four hours in advance of placing concrete to permit inspection of formwork, reinforcing, bearings, etc.
  - .3 Tests include the following:
    - .1 Obtaining verification of cement
    - .2 Tests of reinforcing
    - .3 Tests of aggregate
    - .4 Verification of steel fibre content
    - .5 Tests of setting mixes and design of mix
    - .6 Concrete cylinder test. Three cylinders from each day's pour for each 75 m<sup>3</sup>. of concrete or for each 30 m<sup>3</sup> of concrete poured in small amounts on successive days.
  - .4 Tests will be made in accordance with CSA-A23.2.
  - .5 Inspection company's reports of tests will be forwarded to Consultant and to Contractor with an opinion or reason for any abnormalities noted thereon.
  - .6 Cooperate with and assist inspection company's personnel during inspections and tests.
  - .7 Remove defective materials and completed work which fail tests and replace as directed by Consultant.
  - .8 Where work or materials fail to meet strength requirements as indicated by test results, the costs of additional inspection and testing required for the new replacement work or materials.

1.5 **PRODUCT DELIVERY, STORAGE AND HANDLING**

- .1 Store materials on site in a manner to prevent damage. Protect from the weather. Comply with CSA-A23.1, Clause 5.1.
- .2 Protect the materials and work of this section from damage. Protect other work from damage resulting from this work. Replace damaged work which cannot be satisfactorily repaired.

2 Products

2.1 **MATERIALS**

- .1 Portland cement: CAN/CSA-A3001 Normal, Type GU Portland cement, (Moderate Type MSb - Mild Exposure) (High Early Strength Type HE) (Sulphate Resistant Type HS).
- .2 Coarse aggregate: CSA-A23.1, Clause 4.2.3.4 and Table 11, Group I, 20-5 mm, 100% crushed, in cubular size.
- .3 Fine aggregate: CSA-A23.1 Clause 4.2.3.3 and Table 10.
- .4 Reinforcing steel: CAN/CSA G30.18-M, Grade 400.
- .5 Reinforcing mesh: CSA G30.15-M, flat sheets. Rolls are not acceptable.
- .6 Shrinkage control fibres: Bekaert "Dramix" steel fibres conforming to ASTM A820, Type 1, deformed, cold drawn galvanized steel wire; RC-65/60-CN with a tensile strength of 895 MPa.
- .7 Water: CSA-A23.1, Clause 4.2.2.
- .8 Forms: New Douglas Fir plywood, G1S for all exposed concrete. Rough T and G lumber or used G1S Douglas Fir plywood for surfaces which will be concealed.
- .9 Tubular forms for lighting pole bases: Sonoco Products Ltd. "Sonotube" spirally wound fibre forms free of dents and other irregularities, treated internally with release material.
- .10 Air entraining admixture: Conforming to ASTM C260; Master Builders, "Micro-Air", Euclid "Airextra", or Grace "Darex AEA EH"/Catexol AE360 (for low slump concrete).
- .11 Water reducing admixture: Conforming to ASTM C494 Type A, Master Builders "Pozzolith 200N", Euclid "WR75", Grace "WRDA 20" or Axim "Catexol 1000N".
- .12 Pigmented curing compound: Conforming to ASTM C309, Type 2, Class B, white pigmented resin based, Master Builders "Promulsion 200", W.R. Meadows "Sealtight 1220", Euclid "Kurez E-40" or Dayton Superior "Day-Chem White Pigmented Cure (J-10)".
- .13 Form ties: Adjustable snap ties, formed to break 25 mm or more from surface of concrete after form removal, with a minimum working strength of 13 kN. Wire ties will not be permitted.
- .14 Formwork release agent: Imperial Oil "Filmo No. 40", W.R. Meadows "Duogard II", Euclid "Super Slip" or Dayton Superior "Clean Strip (J-1)".
- .15 Premoulded joint filler: Asphalt impregnated, W.R. Meadows "Fibre Expansion Joint", CPD "Flexcell" or approved equivalent. Furnish with 13 x 13 mm removable "tacked-on" strip in the formation of the joint, to provide for proper sealant depth after stripping.
- .16 Chairs or spacers: Rigid type by Drummond and Reeves Ltd., Acrow Richmond or Superior Concrete Accessories.
- .17 Hot-poured joint sealant (sawcuts): Premium quality rubberized compound, black colour:
  - .1 W.R. Meadows "Hi-Spec"
  - .2 Henry "590-13A"
  - .3 Hydrotech "6165"

- OR -

- .18 Standard joint sealant: Two component chemically reactive polyurethane modified sealant, self-levelling type, grey colour meeting ASTM C920.
  - .1 W.R. Meadows "Sealtight Pourthane"
  - .2 Euclid "Eucolastic II"
  - .3 Sika "Sikaflex 2C NS/SL"
  - .4 Tremco "Vulkem 245"
  - .5 CPD "PSI 551"
- .19 Bonding agent: Meeting ASTM C-881, Sika "Sika-Dur Hi Mod", or W.R. Meadows "Rezi-Weld 1000", Euclid "452 MV", Cappar "Capbond E" or Dayton Superior "Resi-Bond (J-58)".
- .20 Pipe bollards:
  - .1 Surface mounted, bolted down bollards with base plate, conforming to ASTM A500, Schedule 40 standard weight steel pipe cleaned to SSPC SP3 and shop primed with primer conforming to CISC/CPMA 2.75 (hot-dip galvanized to CAN/CSA G164-M).
  - .2 Dimensions of bollard as indicated on Drawings.
  - .3 Base plate: 200 mm x 200 mm x 12.5 mm thick and 4 corner holes.
  - .4 Bollard Cover: Reflective, plastic cover, safety yellow, 6 mm thick.
  - .5 Finish: Schedule 40, safety yellow powder coat finish.
  - .6 Pipe finish: ICI Devoe 201 or approved equivalent two-part polyamide epoxy tie coat, and exterior alkyd enamel topcoat conforming to CAN/CGSB-1.59-M.

## 2.2 **CONCRETE PROPORTIONS**

- .1 Concrete to be ready-mixed and proportioned in accordance with CSA-A23.1 Clause 4.3.1, and as follows:
  - .1 Minimum allowable compressive strength at twenty-eight days: 32 MPa, unless otherwise noted or shown.
  - .2 Minimum cement content: 325 kg/m<sup>3</sup>
  - .3 Slump at point of deposit: 60 mm maximum and 20 mm minimum.
  - .4 Add shrinkage control fibres into the slab mix in the truck on site at the specified dosage rate to the next highest half bag. Minimum dosage rate: 19 kg/m<sup>3</sup>.
  - .5 In no case shall the total amount of steel fibres added to each load of the ready mix concrete average less than the specified dosage rate.
  - .6 Add superplasticizer as required to both fibre reinforced concrete and plain concrete.
  - .7 Confirm mix design to ensure conformance with requirements specified herein.
  - .8 Air entrain all concrete work. Conform to CSA A23.1, Clause 4.3.3, Table 4.
  - .9 Exposure classification: C-2 as defined in Table 2 of CSA A23.1.

- .2 Add admixtures to concrete mix in accordance with the manufacturer's recommendations.
- .3 The use of calcium chloride or additional admixtures, other than those specified, is prohibited.

### 3 Execution

#### 3.1 EXAMINATION

- .1 Confirm that surfaces on which concrete is to be placed are free of frost, water and debris before placing concrete.
- .2 Ensure that substrates are compacted and acceptable, and that reinforcement, inserts and all other built-in work are in place and secured before pouring concrete.

#### 3.2 FORMWORK

- .1 Construct formwork according to CSA-A23.1, except where shown otherwise. Ensure no lumber remains in concrete.
- .2 Form for depressions and recesses required in concrete to receive all other work.
- .3 Form 13 mm x 13 mm minimum chamfered edges on all exposed concrete corners.
- .4 Forms may be removed any time after seven days from date of placing concrete or otherwise as directed by the Consultant. Remove forms in accordance with CSA-A23.1.

#### 3.3 PLACING

- .1 Place concrete to prevent layering and segregation and vibrate sufficiently to ensure thorough compaction, maximum density, and according to CSA-A23.1 Clause 6.8.5.4. Hand spade concrete adjacent to forms with metal spatulas.
- .2 Before placing fresh concrete against set or partially set concrete, clean surfaces to remove dirt, scum, shavings, debris, laitance, etc. On set surfaces, brush generously with bonding agent.
- .3 Check Work frequently with accurate instruments during concrete placing.

#### 3.4 CONCRETE FINISHING - GENERAL

- .1 For concrete mixes containing steel fibre reinforcement, ensure that finishing process leaves surface free of protruding fibres. If fibres protrude from surface after concrete has set, remove protruding fibres.

#### 3.5 CONCRETE PAVING AND DOLLY PADS

- .1 Screed concrete to required levels, with falls indicated, to tolerance of 3 mm in 3 m.
- .2 Wood float and finally, steel float or trowel concrete. Avoid excessive trowelling.
- .3 To produce a uniform, non-slip finish, apply a medium texture, non-directional machine float. Overlap adjacent strokes. The final finish shall be dense, uniform in texture and free from porous spots, irregularities, depressions, or disturbed particles of coarse aggregate.
- .4 Form construction joints as required.
- .5 Unless shown otherwise, sawcut control joints at maximum 5 m spacing. Also sawcut construction joints. Sawcut using "soft cut" system as follows:

- .1 Perform "dry method" using "soff-cut saw" as soon as the slab will support the weight of the saw and operator without disturbing the final finish. Perform sawcutting from zero to two hours after final floor finishing or within a concrete cutability window of 1.1 MPa/10.5 kg/cm<sup>2</sup> to a maximum of 5.6 MPa/56.3 kg/cm<sup>2</sup>. Replace manufacturer's patented anti-ravel skid plate with each new blade to avoid spalling and ravelling. The depth of cut is determined by aggregate size.
- .2 After sawing and grinding, blow-out joints with compressed air. Immediately broom clean residue caused by sawing operation as work progresses.
- .3 When cleaned joints are dry and prior to traffic being allowed over area, install temporary polyethylene backer rod in joints to prevent contamination of same.
- .6 Apply one coat of curing compound to finished surface immediately after sawcutting in accordance with manufacturer's printed instructions.

### 3.6 **LIGHTING POLE BASES**

- .1 Install tube forms to correct depth and elevation.
- .2 Ensure anchors are correctly oriented in base formwork.
- .3 Seal bolt holes in anchors to prevent ingress of concrete during pour.
- .4 Place reinforcing steel as indicated on the Drawings.
- .5 Install conduits in bases entering a minimum of 300 mm outside of tube form and secure to prevent movement during concrete pour.

### 3.7 **CONCRETE GUTTER, CURB, CURB AND GUTTER AND OUTLETS**

- .1 Unless shown otherwise, form to the applicable OPSD. Finish concrete surface to a broom finish. Round outside curb edges to radii shown. Do not dust neat cement onto freshly placed concrete to facilitate finishing.
- .2 During pouring, properly vibrate concrete to prevent honeycombs.
- .3 Provide transverse joints by sawcutting at intervals not exceeding 5.5 m and filling with backer rod and sealant. Provide premoulded joint filler to form expansion joints between curb and abutting concrete work, and other dissimilar structures.

### 3.8 **SIDEWALKS**

- .1 Screed concrete sidewalks to required levels, with falls indicated, to tolerance of 6 mm in 3 m.
- .2 Wood float and finally, steel float or trowel. Avoid excessive trowelling.
- .3 Finish concrete with one directional screed and coarse broom finish.
- .4 Form dummy joints 6 mm deep at 1.5 m o.c. Tool joints with 6 mm wide steel trowel, radiusing edges 6 mm.
- .5 Form expansion joints at 6 m o.c., maximum.
- .6 Tool edges of sidewalk with 50 mm wide steel trowel, radiusing edges 6 mm.
- .7 Apply one coat of curing and sealing compound to surface immediately after final finishing in accordance with manufacturer's printed instructions.

### 3.9 **EXPANSION/ISOLATION JOINTS**

- .1 Form expansion/isolation joints at building face or other abutments. Place 12 mm thick joint filler keeping top 12 mm below concrete surface.

3.10 **SEALANT**

- .1 Remove tacked-on strip on top of joint filler.
- .2 Apply kraft paper or polyethylene bond breaker over premoulded filler and fill with self-levelling sealant applied in accordance with manufacturer's printed instructions.
- .3 Install sealant in sawcut joints and in expansion/isolation joints.
- .4 Comply with sealant manufacturer's primer, application and temperature requirements. After initial set, prime sealant surface and refill joints with sealant as required to produce slightly convex joint surface.

3.11 **PIPE BOLLARDS, RAILS, PROTECTION POSTS**

- .1 Core drill for, and install posts and pour foundations. Form top 100 mm of foundations with "Sonotube" forms.
- .2 Fill posts with rampacked concrete. Form top of fill to a crowned smooth finish.
- .3 Wash pipe free of grime and dirt. Let dry. Apply two coats of finish paint to a dry film thickness of 38 - 50.8 microns per coat.
- .4 Wash pipe free of grime and dirt. Let dry. Apply a tie coat of epoxy. Within forty-eight hours of tie coat application, apply two coats of topcoat. Take notice that topcoat must be applied within forty-eight hours otherwise topcoat will not adhere properly. Apply tie coat/topcoat in a continuous two-stage operation, i.e. if rain is forecast within forty-eight hours of tie coat application, postpone such tie coat application.

3.12 **TRENCH DRAIN**

- .1 Install and modify precast concrete catchbasin as shown on the Drawings and in accordance with Section 33 41 00.
- .2 Excavate and install compacted granular base and subdrain as shown on the Drawings in accordance with Section 31 00 00.
- .3 Install forms to required levels and install dowels and reinforcing steel as shown on the Drawings.
- .4 Pour and finish concrete to match top of grating frame.

End of Section

(THIS PAGE INTENTIONALLY LEFT BLANK)

1 General

1.1 **SUMMARY**

.1 Section Includes

- .1 Labour, Products, equipment and services necessary to complete the Work of this section.

1.2 **REFERENCES**

.1 Conform to the latest edition of the following:

- |    |                  |  |
|----|------------------|--|
| .1 | ASTM A820        | - Standard Specification for Steel Fibers for Fiber-Reinforced Concrete                                    |

| .9 | CAN/CSA G30.18-M | - Billet-Steel Bars for Concrete Reinforcement   |

1.3 **SUBMITTALS**

.1 Submit Shop Drawings in accordance with Section 01 33 00.

.2 Submit as Shop Drawings, manufacturers' Product data, performance and other criteria for the following:

- .1 Admixtures
- .2 Joint sealant
- .3 Shrinkage control fibres

.3 Also submit the following:

- .1 Concrete Supplier's mix design information based on requirements specified in "Concrete Mix Proportions" herein.
- .2 Proposed method for bulkheads, formwork, etc.
- .3 List of proposed concrete placement equipment.

.4 Drawings of joint assemblies.

.4 Draw Shop Drawings to a scale not smaller than 1:50 and include plans, sections and details.

#### 1.4 **QUALITY ASSURANCE**

.1 Testing and Inspection

.1 Refer to "Quality Control" in Section 01 10 00 – General Requirements.

.2 Work will be inspected and tested for conformance to CSA-A23.1 by an independent inspection company selected and paid for by Owner.

.3 Notify Consultant at least twenty-four hours in advance of placing concrete to permit inspection of formwork, reinforcing, etc.

.4 Testing includes the following:

.1 Obtaining certification of cement

.2 Test of reinforcing

.3 Test of aggregate

.4 Verification of steel fibre content

.5 Test for setting mixes of concrete and design of mix

.6 Concrete cylinder test. Three cylinders from each day's pour for each 75 m<sup>3</sup> of concrete, or for each 30 m<sup>3</sup> of concrete poured in small amounts on successive days

.7 Air entrainment and slump tests which will be made on the same batch of concrete from which the test cylinders are made

.5 Tests will be made in accordance with CSA-A23.2.

.6 Inspection company's reports of tests will be forwarded to the Consultant and to the Contractor with an opinion or reason for any abnormalities noted thereon.

.7 Ensure Work complies with the Ontario Building Code and all pertinent local by-laws and regulations. These shall govern in case of conflict with the specifications. Obtain and pay for permits before starting Work.

.2 Pre-Construction Meeting

.1 Prior to start of the Work, arrange a Project site meeting of all parties associated with the Work of this section including the Consultant and testing company's representative.

.2 Review the Specifications for all Work included under this section and determine a complete understanding of requirements and responsibilities relative to work included, storage and handling of materials, materials to be used, installation of materials, sequence and quality control, Project staffing, restrictions on areas of pours, and other matters affecting the construction, so as to permit compliance with the intent of this section.

#### 1.5 **PRODUCT DELIVERY, STORAGE AND HANDLING**

- .1 Store materials on site in a manner to prevent damage. Protect from the weather. Comply with CSA-A23.1, Clause 5.1.
- .2 Protect the materials and work of this section from damage. Protect other work from damage resulting from this work. Replace damaged Work which cannot be satisfactorily repaired.
- .3 Concrete shall be ready-mixed at plant and transported to the site by truck in accordance with CAN3-A23.1-M77. Hand mixed concrete is not allowed unless accepted in writing by the Consultant prior to starting any Work.
- .4 Maintain constant controls to ensure that finished concrete is dense, uniform, free of air holes or honeycombs and that no segregation or aggregates and cement paste occurs.
- .5 There shall be no concrete pouring in temperatures below 10°C without written permission of the Consultant.

#### 1.6 **RECORDS**

- .1 Keep a written record of concrete pours, showing location, date, cubic metres of concrete including signed trip ticket for each truck, ambient air temperature, and unusual occurrences during placement of each pour. Permit inspection of records by Consultant at any time. At completion of Work, submit a summary of such data in triplicate to the Consultant.

#### 1.7 **WARRANTY**

- .1 Warrant concrete pavement against spalling and/or cracks for a period of two years. Replace defective work at no cost to the Owner; perform repair or remedial work at a time convenient to the Owner.

#### 2 **Products**

##### 2.1 **MATERIALS**

- .1 Portland cement: CAN/CSA-A3001 Normal, Type GU Portland cement, (Moderate Type MSb (20S) - Mild Exposure) (High Early Strength Type HE (30)) (Sulphate Resistant Type HS (50)).
- .2 Coarse aggregate: CSA-A23.1, Clause 4.2.3.4 and Table 11, Group I, 40-5 mm. Coarse aggregate shall be 100% crushed, in cubular size.
- .3 Fine aggregate: CSA-A23.1, Clause 4.2.3.3 and Table 10.
- .4 Water: CSA-A23.1, Clause 4.2.2.
- .5 Forms: Steel, of such strength as to adequately support and maintain exact alignment under the weight of the concrete spreading and finishing equipment. Forms shall have keyways.
- .6 Mesh reinforcing: In accordance with CSA G30.5-M.
- .7 Shrinkage control fibres: Bekaert "Dramix" steel fibres conforming to ASTM A820, Type 1, deformed, cold drawn steel wire; RC-65/60-BN with a tensile strength of 895 MPa (130,000 psi).
- .8 Water reducing, high range admixture (superplasticizer): Conforming to ASTM C494 Type F, Master Builders, "Rheobuild 1000", Euclid "Eucon 537", or Grace "Duracem 100".

- .9 Dowels: Conforming to CAN/CSA G30.18-M, Grade 400. Use at pavement construction joints.
- .10 Chairs and spacers: Precast concrete bricks with embedded tie wires as manufactured by Drummond and Reeves Ltd., Acrow Richmond, or Superior Concrete Accessories Ltd.
- .11 Water reducing admixture: Conforming to ASTM C494 Type A; Master Builders "Pozzolith 200N", Euclid "WR75", Grace "WRDA 20" or Axim "Catexol 1000N".
- .12 Premoulded joint filler: Asphalt impregnated, W.R. Meadows "Fibre Expansion Joint", CPD "Flexcell" or approved equivalent. Furnish with 13 x 13 mm removable "tacked-on" strip in the formation of the joint, to provide for proper sealant depth after stripping.
- .13 Air entraining admixture: Master Builders "Micro-Air", Euclid "Air Extra" or Grace Darex "AEA EH"/Catexol AE360 (for low slump concrete), conforming to ASTM C260.
- .14 Formwork release agent: Imperial Oil "Filmo No. 40", Goodco Ltd. "Noxcrete", W.R. Meadows "Duogard II", Euclid "Super Slip" or Dayton Superior "Clean Strip (J-D)".
- .15 Pigmented curing compound: Conforming to ASTM C-309, Type 2, Euclid "Kurez E-40", W.R. Meadows "Sealtight 1220", Master Builders "Promulsion 200" or Dayton Superior "Day-Chem White Pigmented Cure (J-10)".
- .16 Hot poured joint sealant: Premium quality rubberized compound, black colour:
  - .1 W.R. Meadows "Hi-Spec"
  - .2 Monsey Bakor "590-13A"
  - .3 Hydrotech "6165"
- .17 Bonding agent: Meeting ASTM C-881, Sika Chemical "Sika-Dur Hi-Mod", W.R. Meadows "Rezi-Weld 1000", Euclid "452 MV" or Cappar "Capbond E".
- .18 Line painting: Refer to Section 32 17 23.23 Pavement Markings.

## 2.2 **CONCRETE MIXING**

- .1 General: Concrete to be ready-mixed and proportioned in accordance with CSA-A23.1, Clause 4.3.1, and as follows:
  - .1 Proportion concrete to achieve 32 MPa minimum compressive strength at twenty-eight days.
  - .2 Slump where vibratory placing and finishing equipment is not used or where only limited vibration is possible: 31 mm,  $\pm 19$  mm.
  - .3 Slump where internal and/or vibratory placing and finishing equipment is used: Between 65 mm,  $\pm 25$  mm.
  - .4 Air entrain concrete to produce 6% ( $\pm 1$ ) entrained air.
  - .5 Add shrinkage control fibres into the mix in the truck on site at the specified dosage rate to the next highest half bag. Minimum dosage rate: 19 kg/m<sup>3</sup>.
  - .6 In no case shall the total amount of steel fibres added to each load of the ready mix concrete average less than the specified dosage rate.
  - .7 Concrete Supplier to confirm mix design to ensure conformance to the foregoing and submit same to the Consultant.

- .8 Air entrain all concrete work. Conform to CSA A23.1, Clause 4.3.3, Table 4.
- .9 Exposure classification: C-2 as defined in Table 2 of CSA A23.1.
- .2 Admixtures
  - .1 Add admixtures to concrete mix in accordance with the manufacturer's recommendations. The manufacturer shall make available, at no cost, upon seventy-two hours notice, the services of a qualified, full-time field representative to assure proper use of admixtures.
  - .2 The use of calcium chloride or additional admixtures, other than those specified, is not acceptable.

## 2.3 **EQUIPMENT FOR CHECKING, PLACING AND FINISHING**

- .1 Scratch template: For checking contours of base from side forms, equipped with adjustable rods projecting down to base course at maximum 300 mm intervals.
- .2 Spreader: Mechanical self-propelled type capable of moving concrete forward and laterally, and of correcting segregated areas.
- .3 Surface vibrators for non-strip poured concrete: Hand-held, portable vibrating screed with extension handles.
- .4 Surface vibrators for strip poured concrete: Vibrating screed or vibrating pan type or Hand-held vibrating screed. Use at least one vibratory unit for each 2.4 m length of vibrating screed or each 1.8 m length of vibrating pan.
  - .1 Synchronize units on each individual screed or pan to operate at a frequency of not less than three thousand five hundred pulsations per minute.
  - .2 Use a "bullnose edge" on the leading edge of the screed or pan.
  - .3 Operate equipment in such a way that each section of pavement receives at least one pass but not more than two passes.
- .5 Internal vibrators for paving having a depth in excess of 200 mm: Adequate to properly consolidate the concrete.
  - .1 Frame-mounted vibratory units with vibrating tubes extending into the slab shall have a clear distance between tubes of units not exceeding 760 mm.
  - .2 Insert vibrators of this type into the concrete to a depth which will provide the best compaction but not closer than 50 mm from the subgrade or side forms. Operate internal vibrators at frequencies of not less than five thousand vibrations per minute.
- .6 Finisher: Mechanical self-propelled, with two independently operated transverse screeds.
- .7 Float: Wood or metal, straight, smooth, sufficiently light to avoid sinking into concrete surface, operated mechanically or manually from edge to edge while advancing longitudinally.
- .8 Alternate equipment: Should Contractor wish to employ alternate types of equipment he shall identify such alternate as an attachment to his Bid and shall produce evidence that the alternate equipment is capable of producing a satisfactory result in accordance with this Specification.

### 3.1 **INSPECTION OF JOB CONDITIONS**

- .1 Examine previously constructed work including placement and compaction of earth subgrade. Check and review compaction test results of fill to receive this work. Report to the Consultant in writing any defects or discrepancies. Commencement of work implies acceptance of existing conditions.
- .2 Re-fine grade and recompact earth subgrade for concrete paving. Compact to densities and methods.
- .3 Check subgrade between forms with scratch template in the presence of the Consultant.
- .4 Correct any irregularities or depressions that develop under rolling by loosening the material at such locations and adding or removing material and re-compacting until the surface is smooth and uniform. Dig out any soft spots which develop in the subgrade during or after compaction operations and replace as specified in Section 31 00 00.
- .5 Dampen subgrade before concrete is placed thereon. Do not place concrete until the condition of the subgrade has been inspected by the Consultant.
- .6 Repair any areas of subgrade which have been disturbed due to concreting operations ahead of concrete placing operations at no cost to the Owner.
- .7 Establish elevations of compacted subgrade base materials prior to commencing work.

### 3.2 **TESTING**

- .1 Arrange and pay for testing of the concrete by an independent testing agency accepted by the Consultant. Submit testing reports to the Consultant.

### 3.3 **FORMWORK**

- .1 Build forms and secure in place with pins, stays and braces of sufficient strength to support and keep alignment under weight of spreading and finishing equipment.
- .2 Set forms true to line and grade, join neatly and tightly, and stake securely to resist concrete pressure and impact from tampers without springing.
- .3 Construct forms to produce finished concrete forming to shape dimensions, locations and levels indicated within tolerances required by CSA-A23.1-94, and/or as established by accepted mock-up.
- .4 Install keyways as indicated.
- .5 Clean and oil forms before each use.
- .6 Obtain Consultant's inspection of installed forms before placing concrete.
- .7 Leave forms in place for minimum of twenty-four hours after concrete placement.
- .8 Remove forms in a manner to prevent damage to concrete. Do not pry with crow bars or heavy tools against concrete edges.
- .9 Install sleeve for utilities as per Drawings. Coordinate with other installers and have layout accepted by the Consultant.
- .10 The cross-fall of the concrete paving shall be as indicated on the Drawings and in the direction of the slop of the surrounding grade.

### 3.4 **PLACING AND SPREADING**

- .1 Place reinforcing mesh on steel chairs.
- .2 Place concrete in accordance with CSA-A23.1, Clause 6.8.5.4. Place using mechanical spreader. Hand placing may be used where machine spreading is not feasible. Do not allow workers to walk on fresh concrete.
- .3 Place concrete in strip pours in alternate lane pattern at widths and in accordance with layout shown on Drawings and per sequence as reviewed by Consultant. Allow for minimum seventy-two hours between pour strips lanes to provide for initial shrinkage.
- .4 Place concrete to lines, grades and depths indicated. Do not place on a frozen surface.
- .5 Install sluices to limit height of free fall of concrete to 1.2 m maximum. Place all concrete to prevent layering and segregation.
- .6 Discharge concrete into forms as soon as practical after mixing.
- .7 Spread uniformly with thickness sufficient to allow for proper consolidation, finishing and attainment of overall pavement thickness shown.
- .8 Work concrete into complete contact with forms, reinforcement and other embedded items. Take care to avoid displacing dowel bars or embedded items from position. Consolidate concrete adjacent to side forms and joints with a vibrator along the entire length of forms or joints before finishing operations are started.
- .9 Check Work frequently for lines and levels with accurate instruments during placing of concrete.
- .10 Before placing fresh concrete against set concrete at construction joints, clean surfaces to remove all dirt, scum, debris, laitance, etc. Grease dowels generously at construction joints.
- .11 Protect freshly laid concrete from damage by rain. Place a covering material such as burlap, cotton mats, curing paper or plastic sheathing to protect surfaces in case of rain. Extend protective coverings over edges of concrete and arrange so as not to bear on unprotected edges.

### 3.5 **CONSOLIDATION**

- .1 Consolidate concrete by vibrating screed or vibrating pan.
- .2 On odd shaped slabs inaccessible to the frame-mounted vibratory equipment, use hand held vibratory screed.
- .3 Operate vibrators only when the finishing machine is in motion. Take care to prevent over-vibration.
- .4 After concrete has been consolidated, smooth and consolidate further by means of a longitudinal float.
- .5 Scrape-off all laitance.
- .6 After the final pass of the longitudinal float, check the surface of the pavement with an approved straight edge 4.5 m in length. Correct any irregularities exceeding 6 mm immediately before any initial set has developed in the concrete.

### 3.6 **LONGITUDINAL, TRANSVERSE AND ISOLATION JOINTS**

- .1 Longitudinal joints, except where shown otherwise, are keyed and dowelled system; transverse joints at right angles to the centerline and extending the full width of the pavement.
- .2 Place steel dowels in all construction joints.
  - .1 Cut vertical open slots or oversized drilled holes in the header board to facilitate the placing of steel dowels and the subsequent removal of the header board.
  - .2 Upon the resumption of work, carefully remove header board; clean away any surplus concrete on the subgrade and deposit the fresh concrete directly against the previously cast concrete.
- .3 Rigidly fix steel dowels so as to retain alignment parallel to the surface of the concrete and at right angles to the joint. Uniformly coat dowels with a heavy grease for their entire length.
- .4 Construct all joints perpendicular to the pavement surface.
- .5 Install isolation joint filler where pavement is poured against vertical structures which penetrate the pavement and at such other locations as may be shown on the Drawings.
- .6 Form construction joint at the end of each day's run or where interruptions of the work for thirty minutes or more occur but only where the length of pavement laid from the last joint is more than 3 m.
  - .1 Sections less than 3 m in length between joints will not be permitted.
  - .2 If sufficient concrete is not mixed to form a slab at least 3 m in length, terminate paving at the preceding joint location and dispose of excess concrete off site or as otherwise directed by the Consultant.

### 3.7 **CONCRETE PAVING WITH HEAT TRACING**

- .1 Place first concrete pour as specified within this specification to 75 mm thickness and finish.
- .2 Sawcut joints with the soft-cut method as specified in this Specification.
- .3 After first pour initial set, install heat tracing system in accordance with manufacturer's printed instructions.
- .4 Apply bonding agent to entire first pour surface area.
- .5 Place second concrete pour as specified within this specification to 75 mm thickness. Finish as specified.
- .6 Sawcut joints with the soft-cut method to coincide with initial sawcuts in first pour slab.
- .7 Using regular sawcut equipment, re-cut soft-cut joints twelve to twenty-four hours following sawcutting to widen joints to width shown as required for proper sealant adhesion.
- .8 Fill sawcut joints with joint sealant as specified within this Specification.

### 3.8 **FINISHING**

- .1 After concrete has been spread and consolidated, compact surface of concrete further by power mechanical self-propelled finisher. Hand methods may be used in areas inaccessible to power mechanical equipment.

- .2 The surface of the pavement shall be at the exact grade elevation indicated on the Drawings.
- .3 Apply finishing machine over each area of pavement as many times and at such intervals as is necessary to give the proper compaction and to leave a surface of uniform texture, true to grade.
  - .1 Avoid excessive operation over a given area.
  - .2 Keep the top of forms clean by a device attached to the equipment; maintain the travel of the equipment on the forms true without lift, wobbling, or other variation tending to affect the precision finish.
- .4 For concrete mixes containing steel fibre reinforcement, ensure that finishing process leaves surface free of protruding fibres. If fibres protrude from surface after concrete has set, remove protruding fibres.

### 3.9 **SURFACE TEXTURING**

- .1 Broom finish pavement using steel or fibre broom not less than 450 mm wide, drawing broom across the width of the pavement at right angles to the longitudinal joints to produce corrugations not exceeding 3 mm in depth. Overlap adjacent strokes. The final finish shall be uniform in texture and free from porous spots, irregularities, depressions, or disturbed particles of coarse aggregate.
  - OR -
- .2 Float to a medium texture, using non-directional machine float. Overlap adjacent strokes. Finish to a surface which is uniform in texture and free from porous spots, irregularities, depressions, or disturbed particles of coarse aggregate.
- .3 After surface has set, grind any fibres protruding above the surface. Sweep surface clean.

### 3.10 **SAWCUTTING - TRANSVERSE JOINTS**

- .1 Sawcut joints in straight lines.
- .2 Perform dry method sawcutting using "soff-cut saw" as soon as the slab will support the weight of the saw and operator without disturbing the final finish. Perform sawcutting from zero to two hours after final floor finishing or within a concrete cutability window of 1.1 MPa/10.5 kg/cm<sup>2</sup> to a maximum of 5.6 MPa/56.3 kg/cm<sup>2</sup>. Replace manufacturer's patented anti-ravel skid plate with each new blade to avoid spalling and ravelling. The depth of cut is determined by aggregate size.
- .3 After sawing and grinding, blow-out joints with compressed air. Immediately broom clean residue caused by sawing operation as work progresses.
- .4 Using regular sawcut equipment, re-cut soft-cut joints twelve to twenty-four hours following sawcutting to widen joints to width shown as required for proper sealant adhesion.
- .5 When cleaned joints are dry and prior to traffic being allowed over area, install temporary polyethylene backer rod in joints to prevent contamination of same.

### 3.11 **SAWCUTTING - LONGITUDINAL JOINTS**

- .1 Sawcut longitudinal construction joints after curing application.
- .2 Use regular sawcutting methods.

- .3 After sawing and grinding, blow-out joints with compressed air. Immediately broom clean residue caused by sawing operation as work progresses.
- .4 When cleaned joints are dry and prior to traffic being allowed over area, install temporary polyethylene backer rod in joints to prevent contamination of same.

### 3.12 **CURING**

- .1 After finishing operation has been completed, cure with one coat of pigmented curing compound at a rate and method as recommended by manufacturer.
- .2 Block traffic from concrete pavement for a minimum of nine days, except to perform the necessary curing and sawcutting operations.

### 3.13 **JOINT SEALANT**

- .1 Do not fill isolation joints, longitudinal joints, and transverse joints sooner than thirty days after concrete pours. Comply with curing and sawcutting requirements as specified herein. Execute joint sealing as specified herein during cool dry ambient conditions when pavement is in a contracted state to minimize future joint separation at sealant filled joints.
- .2 Remove polyethylene rope from sawcut joints.
- .3 Remove 6 mm scored strip from top of premoulded joint filler.
- .4 Blow out joints with compressed air. Immediately broom clean residue.
- .5 Re-install polyethylene rope in sawcut joints. Push to the bottom of the joint.
- .6 Fill all sawed longitudinal and transverse joints in concrete pavement as well as isolation joints full depth with joint sealant in accordance with manufacturer's printed directions.
- .7 Comply with application and substrate temperatures requirements. Mask pavement to edge of joint and fill joint with sealant. After initial set prime sealant surface and refill joints with sealant as required to produce slightly convex joint surface.

### 3.14 **DEFECTIVE CONCRETE**

- .1 Concrete is defective when:
  - .1 Containing honeycombing or embedded debris.
  - .2 Concrete damaged by freezing or which is unsatisfactory due to placement at too high a temperature.
  - .3 Surface texturing, joint type and placement and tolerances are unacceptable in the opinion of the Consultant, and/or do not reflect the standard set by the accepted mock-up.
- .2 Repair of defective concrete work:
  - .1 Repair defective areas while concrete is still plastic; otherwise, wait until curing is completed. Use repair methods accepted by the Consultant.
  - .2 Remove and replace defective concrete where directed.
- .3 Replace full panel for each repair. Replace with new concrete in accordance with these Specifications.

End of Section

(THIS PAGE INTENTIONALLY LEFT BLANK)

1 General

1.1 **SUMMARY**

.1 Section Includes

- .1 Labour, Products, equipment and services necessary to complete the Work of this section.

1.2 **REFERENCES**

.1 Conform to the latest edition of the following:

- .1 CAN/CGSB-1.74 - Alkyd Traffic Paint
- .2 OPSS 310 - Ontario Provincial Standard Specification, Construction Specification for Hot Mix Asphalt
- .3 OPSS 1101 - Ontario Provincial Standard Specification, Material Specification for Performance Graded Asphalt Cement
- .4 OPSS 1150 - Ontario Provincial Standard Specification, Material Specification for Hot Mix Asphalt

1.3 **SUBMITTALS**

.1 Submit Shop Drawings in accordance with Section 01 33 00. Submit the following:

- .1 Asphalt mix designs.
- .2 Information regarding manufacture and installation of pavement markings, blackout paint, asphalt crack sealant and road reinforcement mesh.

1.4 **QUALITY ASSURANCE**

- .1 Refer to "Quality Control" in Section 01 10 00 – General Requirements.
- .2 Implement a quality control program which includes testing and inspection to comply with the intent of these Specifications.
- .3 Owner may employ an independent testing and inspection company to perform additional testing and inspection, and costs of such tests and inspections will be paid for by Owner.
- .4 Consultant may have cores taken from finished pavement by an independent testing firm to ensure that paving has been placed to required thickness as shown and to specified degree of compaction. Testing will be at the expense of the Owner. Patch core holes resulting from the removal of samples, with asphaltic concrete material as specified herein.
- .5 Remove and replace areas of asphalt work proven defective by the tests or contrary to requirements shown and specified, as directed by Consultant and at no cost to Owner.

1.5 **PROJECT CONDITIONS**

.1 Protection

- .1 Protect buildings and work of other trades from damage caused by work of this section. Correct damage caused by work of this section at no cost to Owner.
- .2 Protect work of this section from damage or deformation during period of construction. Remove and replace precast bumper curb that are cracked,

chipped, broken or otherwise damaged with new units acceptable to Consultant at no cost to Owner.

- .3 Erect temporary barriers, signs, protective covers, and rain protection as required. Remove protection when pavement is ready for traffic.
- .4 Do not apply pavement during wet weather, or unless granular base is dry in terms of asphaltic concrete paving.

## 2 Products

### 2.1 MATERIALS

- .1 Asphaltic concrete paving: Conforming to OPSS 310, composed of a base course and a surface course, of types as shown.
  - .1 Asphalt cement: Conforming to requirements of OPSS 1101, PGAC 58-28 for light duty traffic and PGAC 64-28 for heavy duty traffic.
  - .2 Asphalt primer: Liquid asphalt emulsion, slow drying for spray or brush application.
  - .3 Recycled content: Use recycled asphalt product (RAP) in binder/base course mixes only. Do not use for wearing course.
- .2 Asphalt crack sealant: Hot poured rubberized asphalt thermoplastic sealing compound. Hydrotech Sealz 6165 or approved equivalent.

### 2.2 PRECAST BUMPER CURBS / WHEEL STOPS

- .1 35 MPa compressive strength at twenty-eight days, air entrained, smooth finished with chamfered edges, 140 mm x 250 mm x 2400 mm long sections, with two anchor holes.
- .2 Grout: Pre-mixed, non-shrink, flowable type, Euclid "Euco NS", Master Builders "Construction Grout", Sika "Grout 212" or "M-Bed Standard", W.R. Meadows "CG 86", CPD "Non-Shrink" or Dayton Superior "1107 Advantage Grout"; without aggregate fillers.

## 3 Execution

### 3.1 EXAMINATION

- .1 Inspect state of paving base preparation and other existing conditions upon which work of this section is dependent. Report to Consultant in writing any defects or discrepancies. Commencement of Work implies acceptance of existing conditions.

### 3.2 PREPARATION

- .1 Shape bases as necessary to correspond with finish elevations of pavement, providing for slope as shown. Compact granular bases to densities and methods specified in Section 31 00 00.
- .2 Correct irregularities or depressions that develop under rolling by loosening granular material at such locations and adding or replacing material and recompacting until the surface is smooth and uniform. Dig out and replace soft spots which develop in granular base during or after compaction operations.
- .3 To aid in compaction work or to reduce dust nuisance or both, sprinkle granular base with water during rolling, tamping and blading. Where water is added for improvement of compaction, apply immediately ahead of the compacting unit pass.

- .4 Maximum allowable tolerance in cross-sectional and longitudinal profile is 6 mm at any place measured with a 3 m straight edge.

### 3.3 **PRIMING**

- .1 Prior to application of paving, prime paint vertical contact surfaces with liquid asphalt emulsion.
- .2 Where paving of a course of asphalt has been delayed and/or will not be completed immediately after the underlying course of asphalt has been placed, thoroughly clean surfaces to be paved and apply one full coverage tack coat of asphalt primer immediately before paving.

### 3.4 **TACK COAT**

- .1 Tack coat to existing asphalt surfaces is to be covered with hot mix asphalt.
- .2 Power broom clean and air blast surfaces to remove debris and dust prior to tack coat.
- .3 Apply tack coat of asphalt emulsion diluted with an equal part of water. Apply tack coat to continuous uniform thickness in accordance with manufacturer's recommended rate of application, to bonding surfaces and allow to dry to manufacturer's recommended tackiness before placing hot mix.

### 3.5 **APPLICATION**

- .1 Install asphaltic concrete paving to lines and compacted thicknesses shown conforming to methods of application and compaction requirements of OPSS 310.
- .2 Clean prepared base of all foreign matter prior to application of the mixture to substrate.
- .3 Form well bonded joints. Cut back bituminous course to full depth in straight line as required to expose fresh vertical surfaces. Remove broken or loose material. Paint exposed vertical edge of asphaltic joints with asphalt primer prior to placing asphalt courses.
- .4 Form joints between new and existing work in same manner as specified herein for new work, and in such a manner as to ensure continuous bond at interface.
- .5 Finish surface of pavement free from depressions exceeding 6 mm when measured with a 3 m straight edge. Remedy any low or defective areas by cutting out the course and replacing it with fresh hot mixture, and re-compact.
- .6 Precast Bumper Curbs: Compact grade and secure bumper curbs in place with 600 mm long x 12 mm diameter anchor bar pins. Drive top of pins to slightly below top of curb. Grout holes with non-shrink grout.

### 3.6 **PROTECTION OF PAVING**

- .1 After completion of surface course, prevent vehicular parking on pavement until surface has cured and hardened.

End of Section

(THIS PAGE INTENTIONALLY LEFT BLANK)

- 1 General
  - 1.1 **SUMMARY**
    - .1 Section Includes
      - .1 Labour, Products, equipment and services necessary to installation of concrete curbs and sidewalk Work in accordance with Contract Document.
  - 1.2 **REFERENCES**
    - .1 Conform to the latest edition of the following:
      - .1 ASTM D1751 - Standard Specification For Preformed Expansion Joint Filler for Concrete Paving and Structural Construction (Non-extruding and Resilient Bituminous Types)
      - .2 OPSS 351 - Concrete Sidewalk.
      - .3 OPSS 353 - Concrete Curb and Gutter Systems
      - .4 TS 3.50 - Construction Specifications for Concrete Curb and Concrete Curb and Gutter; Toronto Engineering and Construction Services Division Standard Specifications for Road Works
      - .5 TS 3.70 - Construction Specifications for Concrete Sidewalk and Concrete Raised Median; Toronto Engineering and Construction Services Division Standard Specifications for Road Works
  - 1.3 **SUBMITTALS**
    - .1 Concrete: Refer to Section 03 30 00.
    - .2 Aggregates and fill: Refer to Section 31 23 03.
    - .3 Tactile walking surface indicator: Submit shop drawings illustrating plate layouts for approval.
- 2 Products
  - 2.1 **MATERIALS**
    - .1 Materials shall be in accordance with OPSS 351 and 353.
    - .2 Granular Fill: Refer to Section 31 23 03 Excavation and Backfill for Structures
    - .3 Concrete: In accordance with Section 03 30 00 Cast-In-Place Concrete
    - .4 Expansion joint filler: Premoulded bituminous fibre and in accordance with ASTM D1751.
    - .5 Tactile walking surface indicator: Refer to Section 10 14 75 Tactile Warning Systems. Types as indicated on Drawings.
- 3 Execution
  - 3.1 **INSTALLATION - SIDEWALKS**
    - .1 Place concrete sidewalks as indicated on Drawings to required levels and dimensions.
    - .2 Provide expansion and contraction joints as indicated on Drawings.

- .3 Place 12 mm thick bituminous fibre board to form expansion joints and against existing sidewalks and rigid structures.

### 3.2 **INSTALLATION – CONCRETE CURBS**

- .1 Place concrete curbs, curbs and gutters as indicated on the Contract Drawings.
- .2 Place 12 mm thick bituminous fibre board to form expansion joint and spaced to coincide with expansion joints in adjacent sidewalk and where new curb meets existing curb.
- .3 Contraction joints to coincide with and match existing joints in adjacent sidewalk.
- .4 Place reinforcing bars at base of curb at driveways as indicated on Contract Drawings.

### 3.3 **INSTALLATION - TACTILE WALKING SURFACE INDICATOR PLATE**

- .1 Refer to Section 10 14 75 Tactile Warning Systems.
- .2 Install plates as indicated on drawings and in accordance with manufacturer's installation instructions.

### 3.4 **CONCRETE FINISHES**

- .1 Curbs: Finish edges of contraction joints and expansion joints using a small radius edging tool. Final finish to have light brush texture.
- .2 Sidewalks: Finish concrete adjacent to formwork and joints with tool that produces 5 mm rounded edge and smooth, horizontal surface with maximum width of 50 mm. Final finish to have light broom or swirl float structure.
- .3 Concrete surface to have no irregularities exceeding 6 mm when checked with 3 m straight edge placed in any direction.

End of Section

- 1 General
  - 1.1 **SUMMARY**
    - .1 Section Includes
      - .1 Labour, Products, equipment and services necessary to complete the Work of this section.
  - 1.2 **REFERENCES**
    - .1 Conform to the latest edition of the following:
      - .1 OPSS 710 - Construction Specification for Pavement Markings
      - .2 OPSS 1714 - Ontario Provincial Standard Specification, Material Specification for Field Reacted Polymeric Marking Materials
      - .3 OPSS 1750 - Ontario Provincial Standard Specification, Material Specification for Traffic Paint ReflectORIZING Glass Beads
      - .4 OTM - Ontario Traffic Manual, Book 11
  - 1.3 **SUBMITTALS**
    - .1 Submit Shop Drawings in accordance with Section 01 33 00. Submit the following:
      - .1 Information regarding manufacture and installation of pavement markings, blackout paint, and asphalt crack sealant.
  - 1.4 **QUALITY ASSURANCE**
    - .1 Refer to "Quality Control" in Section 01 10 00 – General Requirements.
    - .2 Installer qualifications: Manufacturer to certify this Subcontractor as an experienced installer who has completed thermoplastic pavement marking projects to the extent that is required for this Project.
    - .3 Implement a quality control program which includes testing and inspection to comply with the intent of these Specifications.
    - .4 Owner may employ an independent testing and inspection company to perform additional testing and inspection, and costs of such tests and inspections will be paid for by Owner.
    - .5 Remove and replace areas of asphalt work proven defective by the tests or contrary to requirements shown and specified, as directed by Consultant and at no cost to Owner.
  - 1.5 **PROJECT CONDITIONS**
    - .1 Protection
      - .1 Protect Work of this section from damage according to manufacturer's recommendations. Protect buildings and work of other trades from damage and replace damaged work that cannot be satisfactorily repaired at no cost to the Owner.
- 2 Products
  - 2.1 **MATERIALS**
    - .1 Durable Pavement Marking:

- .1 Field reacted polymeric pavement marking: Flexible two-component, solvent-free, and lead-free cold-curing acrylic or methacrylate road marking material in accordance with OPSS 1714, Ontario Traffic Manual Book 11, and with reflectorizing glass beads in accordance with OPSS 1750.
    - .1 Parking bays lines shall be identified with 100 mm (4") wide white or yellow painted lines in accordance with approved parking layout and/or in accordance with the requirements or authorities having jurisdiction.
    - .2 Blue: For barrier free accessible parking lot stalls and symbols. Barrier free accessible parking bays and refuge areas shall be identified with appropriate symbol designation and/or in accordance with the requirements or authorities having jurisdiction.
    - .3 Pedestrian walkways shall be identified with 150 mm (4") wide white or yellow painted lines at 45 degrees to path of travel spaced at 400 mm (16") o.c. and/or in accordance with the requirements or authorities having jurisdiction.
  - .2 Blackout paint: "Black Knight" polymer modified industrial grade emulsion sealer by Henry or approved equivalent heavy bodied sealer. Use oil spot primer for oil and chemical stains, and crack filler as required, of types compatible with sealer.
  - .3 Asphalt crack sealant: Refer to Section 32 12 16 Asphalt Paving.
- 3 Execution
- 3.1 **EXAMINATION**
- .1 Inspect state of pavement and other existing conditions upon which work of this section is dependent. Report to Consultant in writing any defects or discrepancies. Commencement of Work implies acceptance of existing conditions.
- 3.2 **PREPARATION**
- .1 Immediately prior to application, clean the asphalt surface of any contaminants that would hinder adhesion.
  - .2 Follow application instructions in accordance with manufacturer's recommendations.
- 3.3 **APPLICATION**
- .1 The material shall be applied to a dry surface in temperatures no lower than 7°C (45°F).
  - .2 Clean prepared base of all foreign matter prior to application of the mixture to substrate.
- 3.4 **PAVEMENT MARKINGS**
- .1 Allow paving to cure before applying markings.
  - .2 Lay out pavement markings as indicated on Contract Drawings and in accordance with manufacturer's instructions.
  - .3 Asphalt and concrete pavement: Use pavement marking material with reflectorizing glass beads.
  - .4 Curbs and vertical surfaces: Use organic solvent based traffic paint.
  - .5 Apply paint with mechanical equipment to clean, dry surface, to a minimum dry film thickness of 228 microns. Provide well defined and straight lines; do not overspray.

- .6 Take precautions to protect freshly painted line work from being marked or otherwise disturbed by traffic, by use of fluorescent cones, barricades or other means until paint is dry.
- .7 Remove spills or tracking of paint and clean up as required.

### 3.5 **BLACKOUT PAINTING**

- .1 Abrade existing paint for proper bonding, then solvent wipe clean.
- .2 Blow out loose paint, dirt and debris from surface using compressed air.
- .3 Treat oil and chemical stains and repair cracks as required.
- .4 Dampen surface with water and remove puddles.
- .5 Mix sealer thoroughly.
- .6 Using a squeegee or brush, apply a thin even coat of undiluted sealer. Allow to dry a minimum of twenty-four hours until no longer tacky.
- .7 Apply second coat crosswise to first coat.
- .8 Ensure blackout paint is dry prior to applying new paint markings.

### 3.6 **OBLITERATING EXISTING PAVEMENT MARKINGS**

- .1 Remove existing painted pavement markings by grinding or abrasive blasting.
- .2 Totally remove the pavement markings to a minimum 10 mm beyond the edge of the marking and to a maximum depth of 3 mm.
- .3 .

End of Section

(THIS PAGE INTENTIONALLY LEFT BLANK)

1 General

1.1 **SUMMARY**

.1 Section Includes

.1 Labour, Products, equipment and services necessary to complete the Work of this section.

.2 Section includes, but is not necessarily limited to, the following:

.1 Raised planter complete with insulation in planters, PVC drains, fastenings and sealants.

.2 Engineering design of material and connections

1.2 **SUBMITTALS**

.1 Submit in accordance with Section 01 33 00.

.2 Show layout, dimensions, details, joint treatment, reinforcing, details of anchorage, sealant and relation to adjoining work. Identify all fittings and grates.

.1 Shop Drawings shall bear the seal and signature of a Professional Engineer registered in Ontario.

1.3 **PROJECT CONDITIONS**

.1 Verify all site dimensions prior to commencing fabrication.

.2 Examine site conditions and notify the Consultant, in writing, of conditions which are not conducive to satisfactory installation.

1.4 **WARRANTY**

.1 Plant materials shall be guaranteed by Contractor for one year after substantial completion. At any time during the warranty period, the Contractor shall remove or replace, without cost the Owner, all plants not in a healthy and flourishing condition as determined by the Owner or Consultant. Replacement plants shall be subject to the same specified requirements, including adherence to original duration of the warranty.

2 Products

2.1 **PLANT SOIL MIX**

.1 Prepackaged planting soil for outdoor planting. Mixture of organic and inert material for sustained vigour of each plant species specified, providing good aeration, drainage, moisture retention and physical support for plants. Free of pests, harmful pathogens, and herbicides.

.2 Accepted Manufacturer:

.1 Pro-Mix by Planting Soil

.2 Or accepted equal

2.2 **MULCH**

.1 Mulch shall be a clean shredded mulch, free of sticks and leaves and not greater than 50 mm in diameter for planting beds. Mulch shall be completed to 75 mm above finished grade.

2.3 **FILTER FABRIC**

Filter fabric, where required, shall be Terrafix 270R or Mirafi Geotextiles P40 or accepted equal. Fabric shall lap all joints at minimum 600 mm.

2.4 **DRAINAGE MATERIAL**

.1 Drainage layer material

.1 19 mm diameter, clearstone drainage course at 150 mm minimum depth.

.2 Drainage pipe: drainage collection pipe shall be perforated or slotted Poly Vinyl Chloride (PVC), or corrugated polyethylene (PE) pipe.

.1 The drain pipe shall be manufactured in accordance with ASTM F758 and/or ASTM F667.

.2 Extend pipe 13 mm beyond face of wall and provide stainless steel grate to prevent debris or rodents.

2.5 **INSULATION**

.1 50 mm rigid insulation board insulation: Refer to Section 07 21 00 Thermal Insulation. Install with adhesive of type recommended by insulation manufacturer.

2.6 **CONCRETE**

.1 Cast-in-place concrete wall. Refer to Section 03 30 00 Cast-in-Place Concrete. Minimum allowable compressive strengths at twenty-eight days 32 MPa, unless otherwise noted, with 5-7% Air Entrainment.

3 Execution

3.1 **GENERAL**

.1 The Contractor shall maintain all planting until Owner's acceptance at Substantial Completion. Maintenance shall include: watering, mulching, resetting plants to proper grade, fertilization and weeding.

.2 All plants shall look vibrant and healthy. Consultant shall have the option to inspect plants prior to purchasing. Owner has the option of acceptance or rejection of any plant materials deemed unacceptable upon delivery to site.

3.2 **PLANT RELOCATION AND RE-PLANTING**

.1 Relocate plants as indicated on Drawings. Re-plant plants in bed, partly filled with prepared mixture, at a minimum depth as indicated on drawings.

3.3 **PLANTING**

.1 Set plants in beds, partly filled with prepared plant mix, at a minimum depth as indicated on drawings under each plant.

.2 Place bare root plant materials so roots lie in a natural position.

.3 Saturate soil with water when the pit or bed is half full of topsoil and again when full.

3.4 **DRAINAGE**

.1 Place drainage material in bottom of container to depth as indicated on Drawings.

- .2 Lay filter fabric over drainage material extending up container walls.
- .3 Place planting medium on top of filter fabric ensuring plants retain same finished grade in container as in nursery growing pot.
- .4 Ensure root ball is moist before transplanting.
- .5 Remove nursery growing pot and place foliage plants into fixed container in position of their natural growth habit.
- .6 Place planting medium around root balls and tamp into place in layers, until finished surface is below top edge of container.
- .7 Water plants immediately and adequately after planting.

## 1.0. EXECUTIVE SUMMARY

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work area(s) for Fire Hall 121 building located at 10 William Carson Cres., Toronto, Ontario, herein after referred to as the "Site". The site inspection and sampling works were conducted on March 10, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

### **Asbestos**

Fisher was provided with the report of a previous DSS, which was conducted by Fisher Environmental Ltd. on April 8, 2016. This report indicates no identified assumed or confirmed ACM within the specified work area(s).

During the current survey, six (6) bulk samples of building materials found within the specified work area(s) and that could potentially contain asbestos, were collected and submitted to Fisher Environmental Laboratories for Polarised Light Microscopy (PLM) analysis, as outlined in NIOSH Method 9002.

The results of analysis revealed that each material sampled does not contain asbestos. Provide a copy of this report to contractors bidding on or performing work within the subject work areas.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

### **Lead**

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current

survey, one (1) bulk sample of beige paint, found in Storage, was collected and submitted to Fisher Environmental Laboratories for lead analysis. The results of analysis revealed that this beige paint contains <10 ppm of lead.

Fisher recommends that, prior to the planned renovation work, the removal of lead containing materials found within the specified work area(s), must be conducted using the appropriate lead abatement procedures. Lead abatement procedures to be used are determined by the method(s) of disturbance employed. Refer to *MOL Guideline: Lead on Construction Projects*, for details

### **Mercury**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey. Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

### **Silica**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings. If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to *MOL Guideline: Silica on Construction Projects* for details.

### **Other Designated Substances**

The other Designated Substances would not be expected to be present at the Site. No immediate actions were recommended with regard to acrylonitrile, arsenic, benzene, coke oven emissions, ethylene oxide, isocyanates, and vinyl chloride.

### **Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work area(s). No action is recommended with regard to mould.

## 2.0. INTRODUCTION

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work area(s) for Fire Hall 121 building located at 10 William Carson Cres., Toronto, Ontario, herein after referred to as the "Site". The site inspection and sampling works were conducted on March 10, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

## 3.0. REGULATIONS

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

The OHSA, R.S.O. 1990, under the Ontario MOL, defines a toxic substance as a biological, chemical or physical agent (or a combination of such agents) whose presence in the workplace may endanger the health and safety of a worker. Sections of the Act that deals with toxic substances are intended to:

1. ensure that worker exposure to toxic substances is controlled;
2. ensure that toxic substances in the workplace are clearly identified and that workers are provided with enough information to be capable of handling them safely; and,
3. provide the general public with access to information about toxic substances used by industry in their communities.

The Act makes provision for a toxic substance to be "designated", where its use in the workplace is prohibited, regulated, restricted, limited or controlled. Designation is reserved for eleven substances that are particularly hazardous, covered under O. Reg 490/09 – *Designated Substances* that was implemented on July 1, 2010, and include Acrylonitrile, Arsenic, Asbestos, Benzene, Coke Oven Emissions, Ethylene Oxides, Isocyanates, Lead, Mercury, Silica, and Vinyl Chloride. Formerly, regulations for these substances were passed separately and each outlined exposure limits where workers were likely to inhale, ingest and / or absorb the substance.

O. Reg. 490/09 provides a consistent approach to dealing with existing requirements and provisions, and outlines steps required to control worker exposure to these substances, including by inhalation, ingestion, skin absorption or skin contact. Each designated substance has an allowable level of exposure based on a time-weighted average (TWA) limit, and may also have a short-term exposure limit (STEL) and / or ceiling limit (C) assigned to it. TWA refers to the time-weighted average airborne concentration of a biological or chemical agent to which a worker may be exposed in a work day or work week, STEL refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed in any 15 minute period, and C refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed at any time. Refer to O. Reg. 490/09 – *Designated Substances*.

A supplementary regulation regarding control of asbestos exposures in the construction industry has evolved into O. Reg. 278/05 – *Asbestos on Construction Projects and in Buildings and Repair Operations*. The regulation includes a definition of asbestos-containing materials (ACM), requirements for additional training and clearance air testing, procedures for determining materials that meet the definition of ACM and for the use of glove bags, and provisions for varying from measure and procedures set out in the regulation.

In addition to the OHSA and regulations regarding designated substances, the following regulations, guidelines and standards were also taken into account or referenced:

- O. Reg. 213/91 - *Construction Projects* regulated under the OHSA and last amended by O. Reg. 443/09;
- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*;
- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes;
- MOL *Guideline: Lead on Construction Projects*, 2011; and,
- MOL *Guideline: Silica on Construction Projects*, 2011.

## 4.0. METHODOLOGY

Fisher followed the protocols outlined in O. Reg. 278/05 for collecting and analyzing bulk samples of materials suspected to contain asbestos. Visual assessment of the material was the primary method of identification with occasional physical contact for the purpose of collecting bulk samples or examining for underlying layers.

Where applicable, samples of suspect materials were collected in order to establish asbestos or lead content. Samples were grouped according to similarity of appearance (“homogeneous” materials). The frequency at which the samples were collected was sufficient to obtain a general representation of the presence of these materials at the Site. Samples collected are presumed to

be representative of respective building materials in-place at the Site. However, due to potential past renovations, alterations, repairs, or phases of construction, it is possible that individual materials may not be representative of samples collected.

Sampling of roofing materials was not part of the current scope of work. Further, sampling of materials found within operating equipment, portable building articles, or generally non-accessible components such as insulation within electrical switch gears, wiring, motors, light fixtures, elevator brakes, fire door cores, etc. was not performed as part of the current survey.

Samples collected during the survey were placed in plastic zip-lock bags which were labeled and submitted for laboratory analysis. Fisher Environmental Laboratories analysed bulk samples for asbestos type and approximate percent content by performing polarized light microscopy (PLM), as outlined in NIOSH Method 9002. Fisher Environmental Laboratories analysed samples for lead content in paint by performing acid digestion followed by Inductively Coupled Plasma (ICP) analysis.

Site Plan(s), indicating specific work area(s) and bulk sample locations, are included in Appendix A. The laboratory certificate(s) of analysis are included in Appendix B.

## **5.0. REVIEW OF PREVIOUS REPORTS**

Fisher was provided with the report of a previous DSS, which was conducted by Fisher Environmental Ltd. on April 8, 2016, attached in Appendix C. This report indicates no identified assumed or confirmed ACM within the specified work area(s).

## **6.0. FINDINGS AND RECOMMENDATIONS**

### **6.1. *Acrylonitrile***

Acrylonitrile would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Acrylonitrile are warranted at this time.

### **6.2. *Arsenic***

Arsenic would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Arsenic are warranted at this time.

### **6.3. *Asbestos***

#### **6.3.1. General Information**

Asbestos is the name given to a group of six different fibrous minerals (amosite, chrysotile, crocidolite, and the fibrous varieties of tremolite, actinolite and anthophyllite) that occur naturally in the environment. Asbestos minerals have separable long fibres that are strong and flexible enough to be spun and woven and are heat resistant.

Because of these characteristics, asbestos has been used for a wide range of manufactured goods, mostly in building materials (roofing shingles, ceiling and floor tiles, paper products, and asbestos cement products), friction products (automobile clutch, brake, and transmission parts), heat-resistant fabrics, packaging, gaskets, and coatings. Some vermiculite or talc products may also contain asbestos.

Asbestos fibres may be released into the air by the disturbance of ACM during product use, renovation or demolition work, building or home maintenance, repair and remodeling. In general, exposure may occur only when the ACM is disturbed in some way to release particles and fibres into the air.

### **6.3.2. Friable vs. Non-Friable ACM**

Based on the requirements of O. Reg. 278/05 and due diligence, an asbestos survey and report must be available at any workplace where asbestos exists identifying locations and types of ACM in the building. The survey must include both friable and non-friable materials confirmed to contain asbestos, as well as any other materials which were not sampled but are suspected (presumed) ACM. The term friable refers to material(s) that could be readily reduced to dust or powder when crushed by hand or moderate pressure. Friable materials have a much greater chance of releasing airborne asbestos fibres when disturbed.

In the past, the most commonly used friable asbestos-containing building materials were surfacing materials (e.g. sprayed on fireproofing, texture, decorative or acoustic plaster) as well as thermal insulation. Examples of manufactured asbestos-containing materials include vinyl floor tiles, ceiling tiles, gasket materials, asbestos cement (transite) pipes or boards, and asbestos textiles. Depending on the above noted formulation, these materials range from non-friable to friable. Although some products are considered non-friable when in Good condition, severe damage or deterioration may cause non-friable materials to generate airborne dust more readily. Severely damaged non-friable materials, or those to be worked on with powered tools, may be considered as friable ACM for abatement purposes.

Examples of common types of ACM by friability include:

- Friable ACM
  - Sprayed Materials (or materials installed by roller or trowel), such as fireproofing, thermal insulation, texture finishes, etc.
  - Mechanical Insulation such as boiler and breeching, ductwork, piping, tanks and associated equipment.
  - Plaster
- Potentially Friable ACM
  - Acoustic Ceiling Tiles

- Vinyl Sheet Flooring
- Non-Friable ACM
  - Vinyl Floor Tiles
  - Asbestos cement (“transite”) piping or paneling
  - Window Caulking

### 6.3.3. Regulations

Exposure to asbestos is controlled by two Regulations passed under Ontario’s Occupational Health and Safety Act (OHSA), R.R.O. 1990.

- O. Reg. 490/09 – *Designated Substances* regarding asbestos applies to:
  - every employer operating a mine for the purpose of mining, crushing, grinding or sifting asbestos;
  - every employer processing, adapting or using asbestos in connection with manufacturing or assembling of goods or products;
  - every employer engaged in the repair, alteration or maintenance of machinery, equipment, aircraft, ships, locomotives, railway cars and vehicles;
  - every employer engaged in work on a building that is necessarily incidental to the repair, alteration or maintenance of machinery or equipment; and,
  - to those workers of such employers who are likely to be exposed to asbestos.

Exposure limits for this substance are set at 0.1 f/cc (TWA) for all types of asbestos.

- O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* applies to buildings that contain friable and non-friable ACM and to the repair, alteration and/or maintenance of these buildings.

In addition to regulations for controlling work around asbestos-containing building materials there are regulations for packaging, transportation and disposal of asbestos-containing waste:

- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*; and,
- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes.

### 6.3.4. Findings

Samples of homogenous materials suspected to contain asbestos were collected and submitted for analysis. Fisher collected six (6) bulk samples of building materials found within the specified work area(s) and that could potentially contain asbestos. Findings of all building materials identified within the specified work area(s) are outlined in further detail below.

**6.3.4.1. Sprayed or Troweled Fireproofing and Thermal Insulation**

No indication of sprayed or troweled fireproofing and / or thermal insulation was noted in any of the specified work area(s) during the current survey.

**6.3.4.2. Texture Finish**

No texture finish was noted in any of the specified work area(s) during the current survey.

**6.3.4.3. Mechanical Insulation**

The majority of mechanical insulation observed throughout the building are either not insulated or are insulated with fiberglass which is not suspected to contain asbestos.

**6.3.4.4. Acoustic Ceiling Tile**

During the current survey, one (1) visually distinct style of ceiling tiles was observed within the specified work area(s).

- Ceiling Tile 1 (2'x4' Short, Random Fissure with Pinpoint).

Ceiling Tile 1 is not expected to be disturbed based on the scope of work required.

**6.3.4.5. Plaster / Drywall Joint Compound**

Plaster was not observed within the specified work areas. Drywall Joint Compound (DJC) was observed in the building. The previous report confirmed that DJC was sampled for analysis. The results of analysis revealed that DJC does not contain asbestos.

**6.3.4.6. Asbestos Cement Products**

No asbestos cement products, such as Transite pipe or board, were noted in any of the specified work area(s) during the current survey.

**6.3.4.7. Vinyl Sheet Flooring**

No vinyl sheet flooring was noted in any of the specified work area(s) during the current survey.

**6.3.4.8. Vinyl Floor Tile**

During the current survey, two (2) varieties of vinyl floor tiles were observed within the specified work area(s).

- Vinyl Floor Tile 1 – 12" x 12", Grey with Streaks, and
- Vinyl Floor Tile 2 – 12" x 12", Brown with Flecks.

Vinyl Floor Tile 1 and 2 are not expected to be disturbed based on the scope of work required.

#### **6.3.4.9. Other ACM**

##### Cream Caulking

Cream caulking was observed along the joints of the block wall and the door frame in the Storage Room. Three (3) samples of the cream caulking were collected for analysis. The results of analysis revealed that the cream caulking around the door frame does not contain asbestos.

##### White Caulking

White caulking was observed in washroom, around the sink. This material was made of silicone and does not contain asbestos.

##### Mortar

Mortar was observed on the block wall in the building. Three (3) samples of the mortar were collected for analysis. The results of analysis revealed that the mortar does not contain asbestos.

#### **6.3.5. Recommendations**

No asbestos-containing materials were identified in any of the specified work area(s). Therefore, no recommendations with regards to ACM are warranted at this time.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

The presence of ACM should be presumed in locations not accessed during this survey. It is possible that ACM is present at the Site that is not identified in this report. Should additional suspected ACM be discovered, it should be presumed as ACM until sample analysis determines asbestos content.

Due to the limited nature of the current scope of work and the presence of solid building finishes (i.e. plaster or drywall walls and ceilings etc.) in many locations, the full extent of ACM may not be confirmed. Precautions should be taken when dismantling solid wall or ceiling finishes, or any other building surfaces which may conceal potential ACM. Such precautions include, but are not limited to, isolation measures and appropriate personal protective equipment.

#### **6.4. Benzene**

Benzene would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Benzene are warranted at this time.

## **6.5.    *Coke Oven Emissions***

Coke oven emissions would not be expected to be present at the Site and were not observed during the current survey. No recommendations for coke oven emissions are warranted at this time.

## **6.6.    *Ethylene Oxides***

Ethylene oxides would not be expected to be present at the Site and were not observed during the current survey. No recommendations for ethylene oxides are warranted at this time.

## **6.7.    *Isocyanates***

Isocyanates would not be expected to be present at the Site and were not observed during the current survey. No recommendations for isocyanates are warranted at this time.

## **6.8.    *Lead***

### **6.8.1.    General Information**

Lead is a naturally occurring bluish–gray metal found in small amounts in the earth’s crust. Most lead in the environment comes from human activities such as burning fossil fuels, mining and manufacturing. Lead is used in the production of batteries, ammunition, metal products (solder and pipes) and X-ray devices.

Lead does not break down but lead compounds are changed by sunlight, air and water. Exposure occurs when eating food or drinking water that contains lead. Deteriorated lead paint can contribute to lead dust. The main target for lead toxicity is the nervous system.

### **6.8.2.    Regulations and Guidelines**

The Ontario MOL has not prescribed criteria defining an analyzed sample of bulk material as “lead-containing”. Further, the MOL has not established a lower limit for concentrations of lead in paint, below which precautions do not need to be considered during construction projects. However, except for very aggressive disturbance of painted finishes, (e.g., abrasive blasting, torch cutting, or grinding), Fisher believes that a lead content below 0.1% by weight (1,000 ug/g or 1000 ppm) represents a concentration in which the lead content is not the limiting hazard for construction hygiene purposes. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations.

The regulation for the designated substance lead applies to every employer and worker at a workplace where lead is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to lead. Exposure limits for this substance are set at 0.05 – 0.10 mg/m<sup>3</sup> (TWA) depending on the type of lead, and for tetraethyl lead 0.30 mg/m<sup>3</sup> (STEL).

Additionally, in 2011 the MOL revised *Guideline: Lead on Construction Projects* outlining practices that should be followed during construction projects to protect workers from exposure to lead. This includes the methods and equipment employed in the removal of lead-containing coatings that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### 6.8.3. Findings

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current survey, one (1) bulk sample of beige paint found in the Storage was collected and submitted to Fisher Environmental Laboratories for lead analysis. The results of analysis revealed that this beige paint contains <10 ppm of lead.

### 6.8.4. Recommendations

Where any lead-containing materials may be disturbed or removed, Fisher recommends that appropriate lead abatement procedures be used. The lead abatement procedures to be used are determined by the method(s) of disturbance employed. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations. The table below outlines lead abatement operations and associated respirator required, as outlined in Ontario MOL guidelines.

#### Classifications of Lead-Containing Operations and Required Respirator

<b>Type 1 Operations</b> (where concentrations of airborne lead would be expected to be < 0.05 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Removal of lead containing coatings with chemical gel or paste and fibrous laminated cloth wrap</li> <li>• Removal of lead containing coatings / materials using power tool that has an effective dust collection system equipped with HEPA filter</li> <li>• Removal of lead containing coatings / materials using non-powered hand tools other than manual scraping or sanding</li> </ul>	Respirators should not be necessary if general procedures are followed and level of air is less than 0.05 mg/m <sup>3</sup> . However, if worker wishes to use a respirator, a half-mask particulate respirator with N-, R- or P-series filter, and 95, 99 or 100% efficiency should be provided.
<b>Type 2a Operations</b> (where concentrations of airborne lead would be expected to be > 0.05 to 0.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Removal of lead containing coatings / materials by scraping or sanding using non-powered hand tools</li> <li>• Manual demolition of lead painted plaster walls / building components by striking with a sledgehammer or similar tool</li> </ul>	NIOSH APF = 10 Half-mask particulate respirator with N-, R- or P- series filter, and 95, 99 or 100% efficiency.
<b>Type 2b Operations</b> (where concentrations of airborne lead would be expected to be > 0.50 to 1.25 mg/m <sup>3</sup> )	
Not applicable to potential renovation activities.	
<b>Type 3a Operations</b> (where concentrations of airborne lead would be expected to be > 1.25 to 2.50 mg/m <sup>3</sup> )	
Activities that include;	NIOSH APF = 50

<ul style="list-style-type: none"> <li>• Welding or high temperature cutting of lead-containing coatings or materials indoors or in a confined space.</li> <li>• Dry removal of lead-containing mortar using an electronic or pneumatic cutting device.</li> <li>• Burning of a surface containing lead</li> <li>• Removal of lead containing coatings / materials using power tools without an effective dust collection system equipped with HEPA filter</li> </ul>	<p>Full-face piece air-purifying respirator with N-, R- or P- series filter and 100% efficiency.</p> <p>Tight-fitting powered air-purifying respirator with high efficiency filter.</p> <p>Full-face piece supplied-air respirator operated in demand mode.</p> <p>Half-mask or full-face piece supplied air respirator operated in continuous-flow mode.</p>

Abrasive blasting of lead-containing coatings or materials.	<p>NIOSH APF ≥1000</p> <p>Type CE abrasive-blast supplied respirator operated in a positive pressure mode with a tight-fitting half-mask face piece.</p>

Refer to MOL *Guideline: Lead on Construction Projects, 2011*, for details of the Ministry's health and safety guidelines regarding lead.

## 6.9. Mercury

### 6.9.1. General Information

Mercury is a naturally occurring metal. It is a shiny, silver-white and odourless liquid. It combines with other elements to form inorganic compounds or salts. Metallic mercury is used to produce chlorine gas and caustic soda, and is used in thermostats and thermometers, fluorescent light bulbs, dental fillings and batteries. Exposure occurs when eating fish or shellfish contaminated with methyl mercury, breathing vapors from spills, incinerators, etc.

The nervous system is very sensitive to all forms of mercury. Exposure to high levels of metallic inorganic or organic mercury can permanently damage the brain, kidneys and developing fetus. Short-term exposure may cause lung damage, nausea, vomiting and diarrhea as well as skin and eye irritation.

### 6.9.2. Regulations

The regulation for mercury applies to every employer and worker at a workplace where mercury is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to mercury. Exposure limits for this substance are set at 0.025 – 0.01 mg/m<sup>3</sup> (TWA) for all forms of mercury excluding alkyl, and for alkyl compounds of mercury 0.03 mg/m<sup>3</sup> (STEL).

### 6.9.3. Findings

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey.

#### **6.9.4. Recommendations**

Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

### **6.10. Silica**

#### **6.10.1. General Information**

Silica is a crystalline compound occurring abundantly as quartz, sand, and many other minerals, and used to manufacture a variety of materials, especially glass and concrete. When mining this substance, silica can be deadly when it becomes airborne. If inhaled, silica dust can cause silicosis which can be fatal.

Some of the following industries have a high potential for risk to workers: construction (sandblasting, rock drilling, masonry work, jack hammering, tunneling), mining (cutting or drilling through sandstone or granite), foundry work (grinding, mouldings, shakeout, core room), stone cutting (sawing, abrasive blasting, chipping, grinding), manufacturing and use of abrasives, etc.

#### **6.10.2. Regulations**

The regulation for silica applies to every employer and worker at a workplace where silica is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to silica. Exposure limits for this substance are set at 0.05 - 0.10 mg/m<sup>3</sup> (TWA), depending on the type of silica. Additionally, in 2011 the MOL revised *Guideline: Silica on Construction Projects* outlining practices that should be followed during construction projects to protect workers from exposure to silica. This includes the methods and equipment employed in the removal of silica-containing materials that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

#### **6.10.3. Findings**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings.

#### **6.10.4. Recommendations**

If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to MOL *Guideline: Silica on Construction Projects* for details.

**6.11. Vinyl Chloride**

Vinyl chloride would not be expected to be present at the Site and was not observed during the current survey. No recommendations for vinyl chloride are warranted at this time.

**6.12. Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work area(s). No action is recommended with regard to mould.

## 7.0. LIMITATIONS

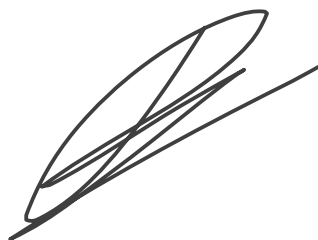

Fisher Environmental Ltd. accepts responsibility for the competent performance of its duties in executing this assignment within the normal standards of the profession, but disclaims responsibility for consequential damages, if any.

The scope of the survey is based on prior agreement with the client, and the rationale given in this report. The survey findings rely on professional interpretation of selective sampling and analysis. Sample analysis results have been applied to homogenous materials in unsampled locations; it was not within the scope of work to carry out an exhaustive sampling and analysis program. For non-accessible building spaces, the likelihood of the presence or absence of asbestos and other designated substances has been described, but such assessment is not a definitive statement of presence or absence.

This report was prepared for the IBI Group. The scope of services performed may not be appropriate for the purposes of other users, and any use or reuse of this document or its findings or recommendations represented herein is at the sole risk of any other user.

We trust that the information provided in the report meets your current requirements. If you have any questions or concerns, please do not hesitate to contact the undersigned.

Respectfully submitted,

Renata Stec, M.Sc.  
Project Manager

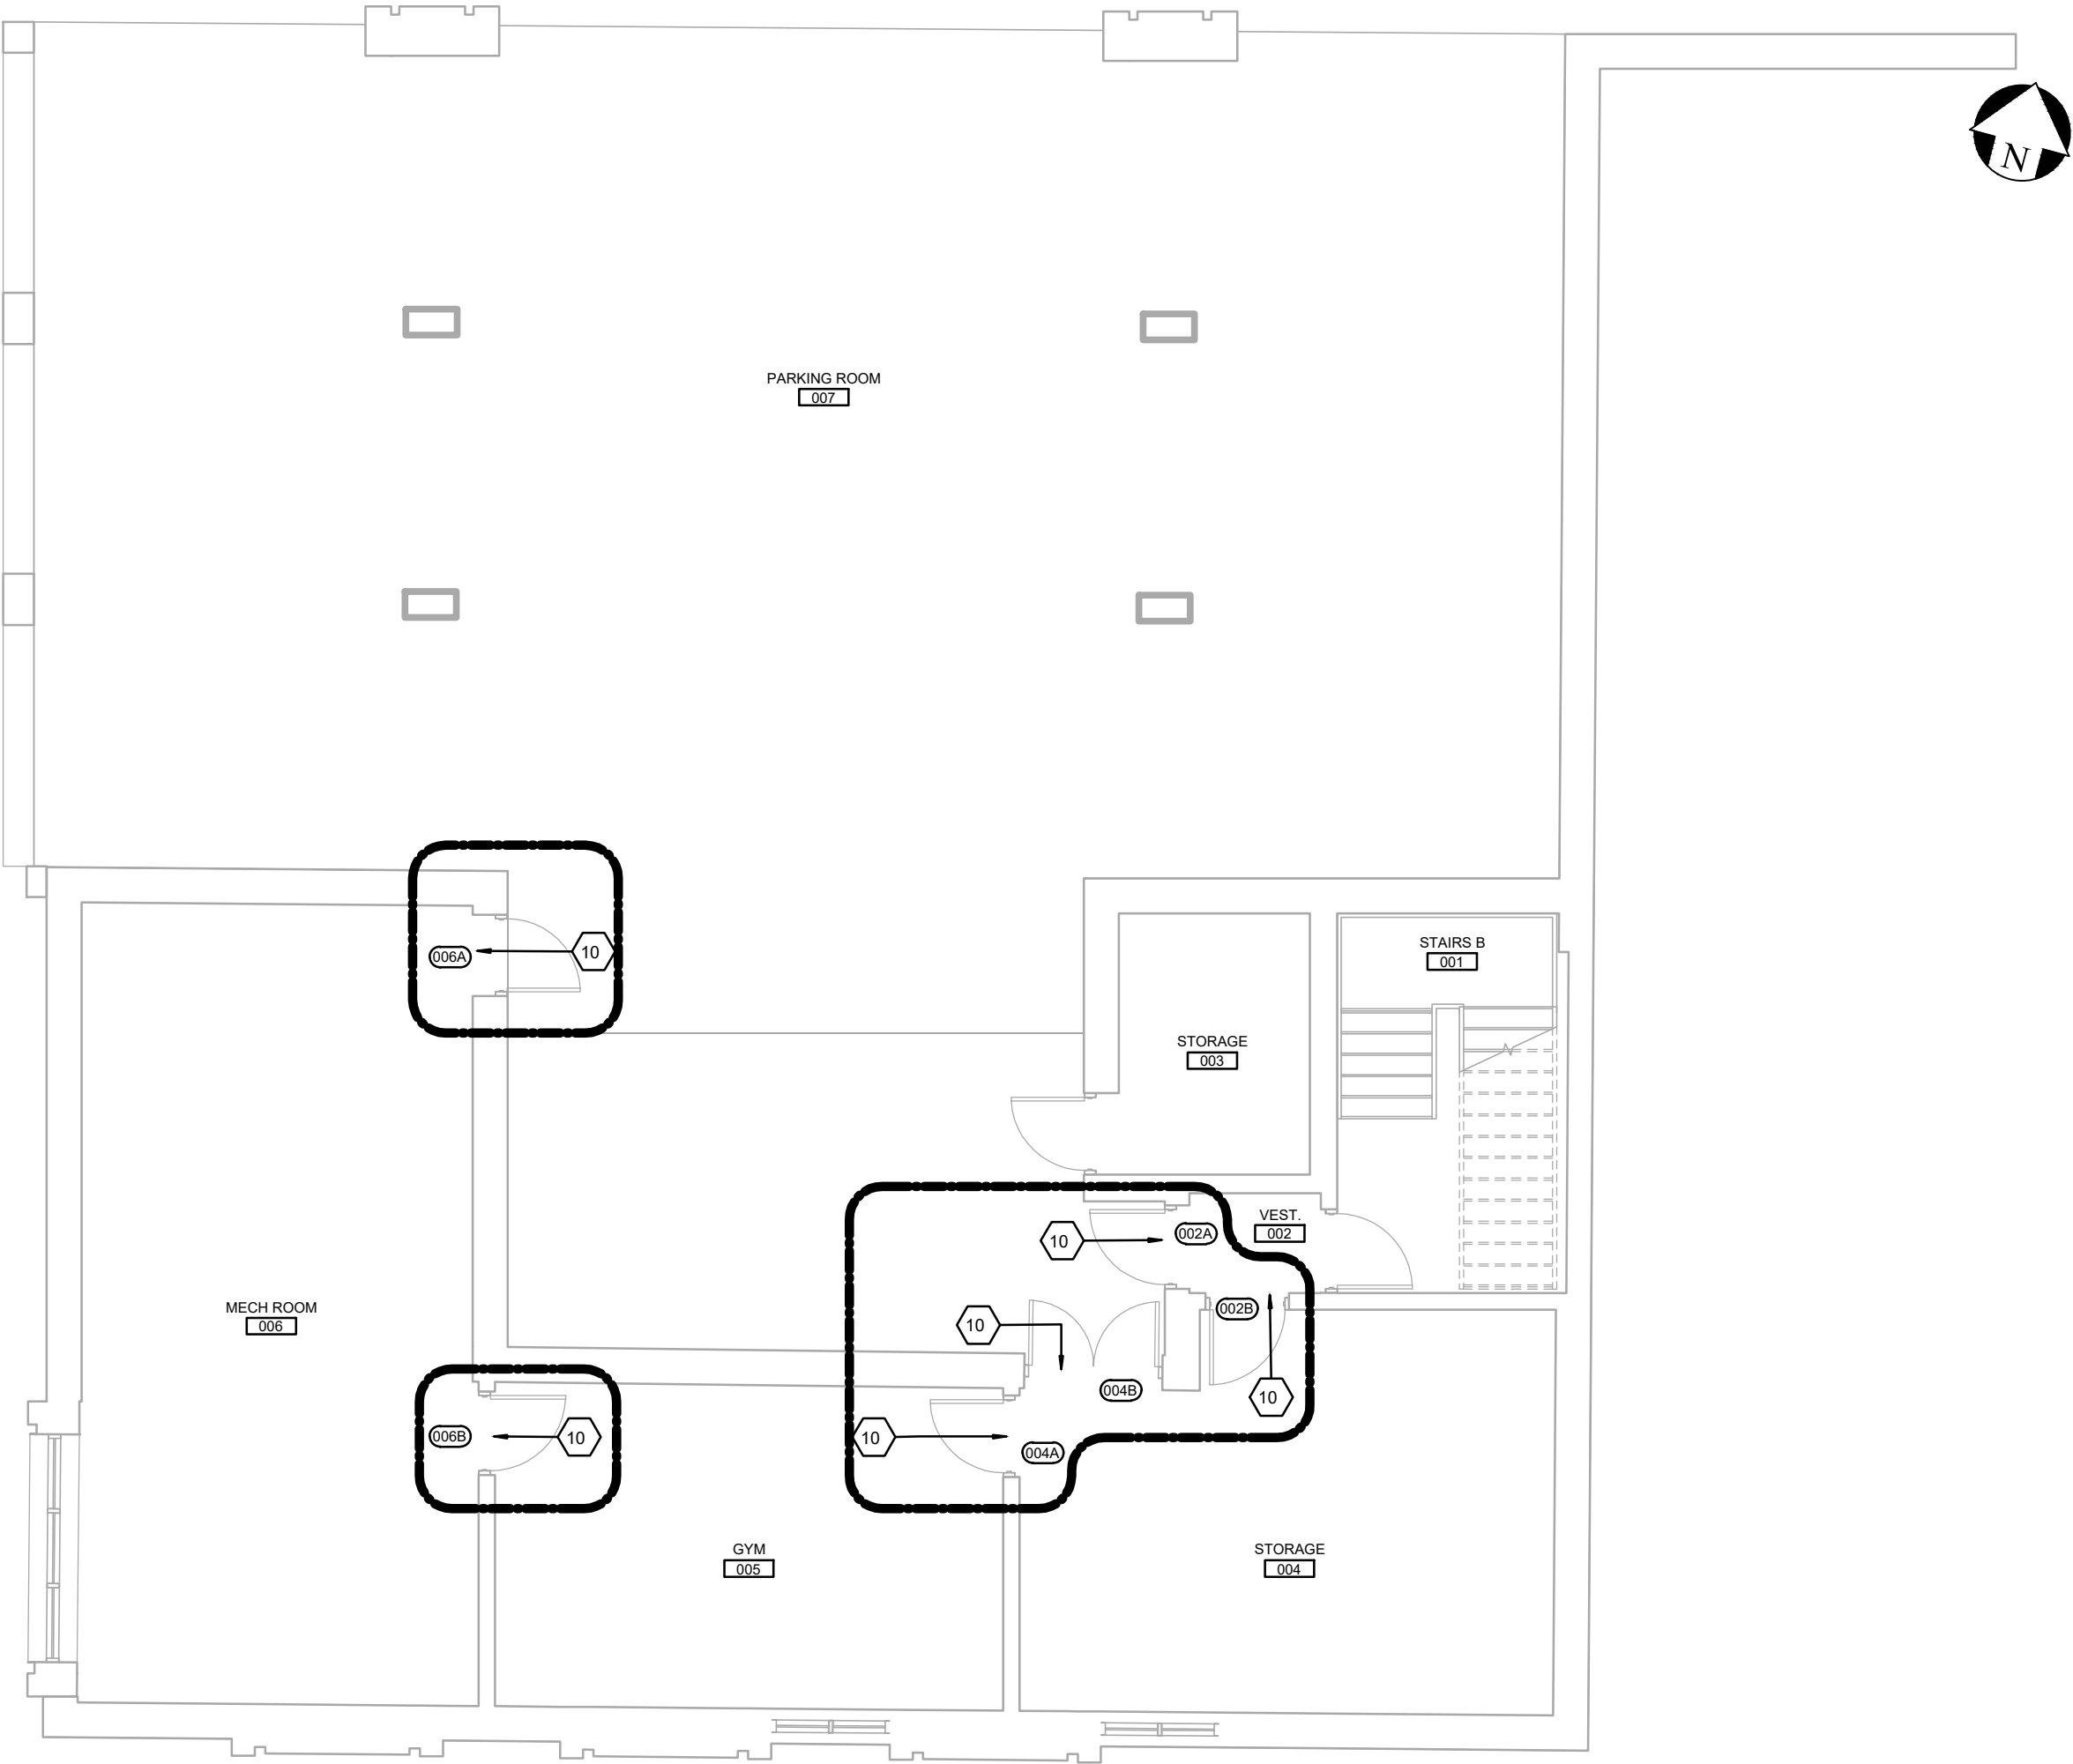

David Fisher, P. Eng., C. Chem.  
Principal

**APPENDIX I – REASSESSMENT SURVEY FORM**

**APPENDIX II – RESULTS OF BULK SAMPLE ANALYSIS**

**APPENDIX III – CORRECTIVE ACTIONS INSPECTION REPORTS**

**APPENDIX IV – SURVEY DRAWINGS**

**APPENDIX V – SITE PHOTOGRAPHS**

## **1. INTRODUCTION AND REGULATORY REQUIREMENTS**

### **1.1 Introduction and Scope**

Fisher Environmental Ltd. was retained by the City of Toronto, Facilities Management to conduct a Designated Substance Survey of building materials in Toronto Fire Station 121 located at 10 William Carson Crescent in Toronto, Ontario.

The objectives of the Designated Substance Survey (DSS) are to establish locations, conditions and types of designated substances contained within a building and, if necessary, provide recommendations to fulfill requirements set forth under the Ontario Occupational Health and Safety Act (OHSA) to achieve regulatory compliance. Preparation of the DSS report, which includes a brief description of the materials present, and the findings of the DSS, will fulfill the requirements of the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 – Designated Substances and O. Reg. 278/05 – Asbestos on Construction Projects and in Buildings and Repair Operations.

The DSS should also include an examination for the presence of polychlorinated biphenyls (PCBs) and visible mould growth. This document should be filed as an addendum to the original survey, which was conducted by ECOH Management Inc. on July 27, 2007.

The *Designated Substance Survey* report is intended for management purposes only to demonstrate compliance with regulations. It is not to be used to establish the designated substance content within building materials before renovation or demolition activities. Prior to any work activities that may disturb building materials, a thorough Pre-Renovation or Pre-Demolition survey of the work area for designated substances and hazardous materials shall be conducted. Muhammad Junayed of Fisher Environmental Ltd. performed the fieldwork on April 8, 2016.

## **2. SURVEY METHODOLOGY**

### **2.1 General Approach**

To ensure familiarity with the building, the Surveyor made reference to the previous assessment and reassessment reports provided by the City of Toronto prior to commencing the survey. The Surveyor also made reference to facility floor plans included in the previous assessment reports, or provided independently by the City of Toronto. Facility drawings identifying locations of asbestos-containing materials, if present, are included in Appendix IV. Site photographs are included in Appendix V.

### **2.2 Survey Methodology**

The City of Toronto provided the consultant with the previous DSS report and / or other survey reports of designated substances identified within the facility, if available. Prior to conducting the DSS, the reports were reviewed by Fisher Environmental Ltd. and updated with all available information regarding ACM, including that from past assessments and reassessments.

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos*

*on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

The Surveyor conducted a visual reassessment of all known and assumed asbestos-containing materials in all accessible areas of the building, as detailed in past survey reports and the Reassessment Survey Form, and recorded the condition (GOOD, FAIR or POOR) of each known or assumed ACM on the Asbestos Reassessment Survey Form. The Surveyor also recorded detailed descriptions of previously-unidentified potential ACM, if observed. Please refer to Appendix I for the updated Reassessment Survey Form.

Materials confirmed to be asbestos-containing during previous assessments were not sampled for this reassessment survey. Additionally, samples were not collected of materials that were previously confirmed to be non-asbestos by the requirements of Ontario Regulation 278/05.

Any other potential asbestos-containing materials noted during the reassessment survey that had not been identified in a previous survey, or were not sampled in accordance with the requirements of O. Reg. 278/05, were sampled as part of the reassessment.

The DSS is based on a walk-through inspection of the facility and shall be conducted room by room to establish locations, conditions and types of designated substances. The survey shall also include an examination for the presence of polychlorinated biphenyls (PCBs) and visible mould growth.

### **3. FINDINGS AND RECOMMENDATIONS**

#### **3.1 Asbestos**

Asbestos fibres may be released into the air by the disturbance of asbestos containing material (ACM) during product use, demolition work, building or home maintenance, repair and remodeling. In general, exposure may occur only when the ACM is disturbed in some way to release particles and fibres into the air.

##### **3.1.1 Findings**

Previously identified assumed ACM include the following:

- Roofing Materials,
- Window Caulking,
- Vinyl Floor Tile – two (2) varieties,
- Acoustic Ceiling Tile – one (1) variety, and
- Drywall Joint Compound.

Drywall Joint Compound not identified during previous assessment surveys was observed in location 1-03 Office.

All assumed ACM were observed to be in GOOD condition at the time of the reassessment.

No samples were collected for analysis of asbestos type and content during the current survey.

Unless previously determined to be non-asbestos, plaster, drywall joint compound, vinyl floor tiles, mastics and window caulking in other areas of the facility should continue to be assumed to be asbestos-containing, and should be sampled prior to renovation and/or demolition activities.

### 3.1.2 Recommendations

All assumed ACM were observed in GOOD condition at the time of the reassessment. Therefore, no recommended corrective actions are made at this time.

Any other building materials suspected to contain asbestos which are not outlined in this report should be assumed to be asbestos-containing until sample analysis determines asbestos content.

Ontario Ministry of Labour Regulation 278/05 requires that an Asbestos Management Program (AMP) be implemented as long as asbestos-containing materials are present in a building. The AMP, original survey report and subsequent reassessment reports must be available at the work place, and must identify the type of asbestos, and where asbestos can be found on a room-by-room basis.

**NOTE:** Interpretation of all sources of asbestos-related information, including but not limited to the original asbestos survey report, asbestos reassessment reports, room-by-room survey data, survey drawings and reports from previous asbestos abatement projects, should be completed by a competent person trained in the historical application of asbestos in building materials, building design and preferably by a person with site-specific knowledge and/or experience.

Information contained within any of the above-noted sources may not relieve the Regulatory responsibility of building Owners, or project Employers/Constructors, to complete a detailed site inspection prior to commencement of a project.

This report should not be used as a substitute for a detailed site inspection to identify asbestos-containing building materials, which must be specifically tailored to the scope and nature of any given project, and completed prior to any maintenance, renovation or demolition work that may cause disturbance to building materials.

## 3.2 Lead

Most lead in the environment comes from human activities such as burning fossil fuels, mining and manufacturing. Lead is used in the production of batteries, ammunition, metal products such as solder and pipes, and x-ray devices. Exposure happens when eating food or drinking water that contains lead. Deteriorated lead paint can contribute to lead dust. The main target for lead toxicity is the nervous system.

The regulation for lead applies to every employer and worker at a workplace where lead is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to lead.

Additionally, in 2004 the MOL issued *Guideline: Lead on Construction Projects* outlining practices that should be followed during construction projects to protect workers' from exposure to lead. This includes the methods and equipment employed in the removal of lead containing coatings that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **3.2.1 Findings**

Paint finishes were generally noted to be in Good condition throughout the Site. During the current investigation, no lead samples were collected for analysis.

No other indication of lead containing materials was observed during the building survey, with the exception of that which may be contained within batteries.

### **3.2.2 Recommendations**

During the disturbance of any painted surfaces that contain lead, it would be recommended that appropriate procedures and use of respirators be followed to protect workers.

No immediate corrective actions were recommended with regard to lead.

## **3.3 Acrylonitrile**

Acrylonitrile is used to make other chemicals such as plastics, synthetic rubber and acrylic fibres. Breathing high concentrations of acrylonitrile will cause nose and throat irritation, tightness in chest, difficulty breathing, nausea, dizziness, weakness, headache, impaired judgment and convulsions. These symptoms usually disappear when exposure has stopped. If spilled on the skin, acrylonitrile will burn the skin and cause blisters and redness. Acrylonitrile is believed to be carcinogenic.

### **3.3.1 Findings**

Acrylonitrile based polymers may have been utilized in the production of some of the building construction materials (e.g. paints, sealants, and adhesives). Although these polymers are generally volatile, they are expected to produce significant acrylonitrile exposure only during or shortly after application of the subject material. If present on site, acrylonitrile would not be expected to be a concern during future renovation or demolition works. Acrylonitrile was not evident in its pure form anywhere within the subject areas of the building.

### **3.3.2 Recommendations**

No immediate corrective actions were recommended with regard to acrylonitrile.

## **3.4 Arsenic**

Inorganic arsenic compounds are mainly used to preserve wood. Organic arsenic compounds are used as pesticides. Arsenic occurs naturally in soil and minerals and therefore may enter air and water. Breathing high levels of arsenic may cause sore throat and irritated lungs. Ingesting high levels of arsenic can result in death. Arsenic is a suspected carcinogenic substance.

### **3.4.1 Findings**

Low levels of arsenic may be contained within paints or coatings utilized on building construction materials, however exposure levels resulting from personal contact are not expected to be significant. Arsenic or arsenic containing compounds were not encountered during the building survey works.

### **3.4.2 Recommendations**

No immediate corrective actions were recommended with regard to arsenic.

### **3.5     *Benzene***

Benzene is colourless liquid with a sweet odour. Benzene utilization has historically been associated with solvents, paints, stains, adhesives, and in the manufacturing of various rubber products. While its current use in building materials has greatly decreased due to an increased awareness of associated health concerns, it may still be present in trace quantities in various industrial solvents. Gasoline sold in Canada contains approximately 4% benzene.

Breathing very high levels of benzene can result in death, while high levels may cause drowsiness, dizziness, rapid heart rate, headaches, and unconsciousness.

#### **3.5.1   Findings**

While it may be expected, given the age of the building, that the original construction materials utilized did contain some trace levels of benzene, it is likely that any has since volatilized and would not exceed the permissible exposure values. During future renovation or demolition works, it would not be expected to be a concern. No evidence of benzene was noted during the building survey, with the exception of that which may be contained in regular gasoline fuel burning equipment.

#### **3.5.2   Recommendations**

No immediate corrective actions were recommended with regard to benzene.

### **3.6     *Coke Oven Emissions***

Coke oven emissions are released during the carbonization of bituminous coal for the production of coke. Exposure routes include inhalation, skin and / or eye contact. Coke oven emissions are potential occupational carcinogens.

#### **3.6.1   Findings**

This substance would not be expected to be found in the building. No evidence of the burning of coke was found during the building survey.

#### **3.6.2   Recommendations**

No immediate corrective actions were recommended with regard to coke oven emissions.

### **3.7     *Ethylene Oxides***

Ethylene oxide is a man-made chemical used primarily to make ethylene glycol (antifreeze and polyester). Breathing low levels of ethylene oxides for a prolonged period of time causes eye, skin and respiratory irritations, and can affect nervous system. Higher levels of exposure for shorter time produce symptoms that are similar but more severe.

#### **3.7.1   Findings**

This substance would not be expected to be found in the building. No evidence of ethylene oxides was found during the building survey.

#### **3.7.2   Recommendations**

No immediate corrective actions were recommended with regard to ethylene oxides.

### **3.8 Isocyanates**

Isocyanates are a family of highly reactive, low molecular weight chemicals. They are widely used in the manufacture of flexible and rigid foams, fibres, and coatings such as paints and varnishes, and elastomers and various building materials (e.g. spray on polyurethane products).

Isocyanates are powerful irritants to the eyes, skin, and respiratory and gastrointestinal tracts.

#### **3.8.1 Findings**

Use of isocyanates or isocyanate compounds would not be expected in the building. No evidence of isocyanates was found during the building survey.

#### **3.8.2 Recommendations**

No immediate corrective actions were recommended with regard to isocyanates.

### **3.9 Mercury**

Mercury is a naturally occurring metal. It is a shiny, silver-white and odourless liquid. It combines with other elements to form inorganic compounds or salts. Metallic mercury is used to produce chlorine gas and caustic soda, and is used in thermostats and thermometers, fluorescent light bulbs, dental fillings and batteries. Exposure occurs when breathing vapors from spills, incinerators, etc.

The nervous system is very sensitive to all forms of mercury. Exposure to high levels of metallic inorganic or organic mercury can permanently damage the brain, kidneys and developing fetus. Short-term exposure may cause lung damage, nausea, vomiting and diarrhea as well as skin and eye irritation.

#### **3.9.1 Findings**

Mercury can be found in fluorescent light bulbs and building thermostats. Prior to future renovation or demolition works, it would be recommended that these products be safely removed. The disposal of mercury containing items are regulated under the Environmental Protection Act, and it would be recommended that for disposal purposes any mercury containing thermostats and fluorescent light bulbs be disposed of at an MOE licensed receiver. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the building survey.

#### **3.9.2 Recommendations**

No immediate corrective actions were recommended with regard to mercury.

### **3.10 Silica**

Silica is a crystalline compound occurring abundantly as quartz, sand, and many other minerals, and used to manufacture a variety of materials, especially glass and concrete. When mining this substance, silica can be deadly when it becomes airborne. If inhaled, silica dust can cause silicosis which can be fatal.

Additionally, in 2004 the MOL issued *Guideline: Silica on Construction Projects* outlining practices that should be followed during construction projects to protect workers' from exposure to silica. This includes the methods and equipment employed in the removal of silica containing

materials that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **3.10.1 Findings**

As the building is constructed of concrete block and brick, with concrete floors, silica is expected to be found within these components of the building. During any significant renovation or demolition works where concrete dust is generated, dust suppression techniques should be utilized to control worker exposure to silica. Silica is expected to be present in concrete and masonry products in the building.

### **3.10.2 Recommendations**

No immediate corrective actions were recommended with regard to silica.

## **3.11 Vinyl Chloride**

Vinyl chloride is used to make polyvinyl chloride (PVC) which is found in a variety of plastic products, including pipes, wires, cable coatings and packaging materials. Breathing high levels of vinyl chloride can cause dizziness, unconsciousness and death. Prolonged exposure causes changes in liver, nerve damage, immune reactions and changes in blood flow.

### **3.11.1 Findings**

PVC pipe is generally stable and does not allow for the liberation of vinyl chloride, under normal conditions. During future renovation or demolition works, this substance would not be expected to be a concern. Vinyl chloride was not evident in its pure form, anywhere in the subject dwellings.

### **3.11.2 Recommendations**

No immediate corrective actions were recommended with regard to vinyl chloride.

## **3.12 Polychlorinated Biphenyls (PCBs)**

PCBs are mixtures of synthetic organic chemicals with the same basic chemical structure and similar physical properties ranging from oily liquids to waxy solids. Due to their non-flammability, chemical stability, high boiling point and electrical insulating properties, PCBs were used in hundreds of industrial and commercial applications including electrical, heat transfer, and hydraulic equipment; as plasticizers in paints, plastics and rubber products; in pigments, dyes and carbonless copy paper and many other applications.

PCBs have been demonstrated to cause a variety of adverse health effects. PCBs have been shown to cause cancer.

### **3.12.1 Findings**

No PCB containing equipment with the potential exception of fluorescent lighting ballasts was observed on site. Fluorescent lighting was observed in use in several areas of the building and inspection of three random light ballasts revealed that they did not contain PCB's. The disposal of PCB containing equipment is regulated under MOE Reg. 558, and it would be recommended that during any ballast replacement works the generated ballasts be evaluated for PCB content, with any PCB ballasts being consolidated and sent for disposal to an MOE licensed PCB receiver under waste class 243D.

### 3.12.2 Recommendations

It would be recommended that during any ballast replacement works the generated ballasts be evaluated for PCB content. Any PCB ballasts identified should be consolidated and sent for disposal to an MOE licensed PCB receiver under waste class 243D.

### 3.13 Mould

Mould contamination inside buildings has become a concern to both building owners and occupants. Exposure to moulds is known to cause a variety of health effects in some people. Many fungal spores are considered to be allergenic to susceptible persons, though individual susceptibility varies greatly.

Elevated levels of indoor mould are usually attributed to the chronic moist conditions due to water leaks, floods or elevated humidity. Under these conditions, already low levels of fungal spores in air from plants and other sources may multiply on cellulose containing materials such as carpets, wallboards, and wood, and result in mould contamination and, if left untreated, can be destructive to certain building materials.

At present, no Federal or Provincial regulations are in effect with respect to reasonable levels of airborne mould spores and other contaminants inside buildings. Health Canada has provided strategies and guidelines related to some indoor contaminants to assist in conducting indoor air quality investigations in their publication *Indoor Air Quality in Office Buildings: A Technical Guide, 1995*. Health Canada recommends that indoor varieties of airborne mould spores should be qualitatively and quantitatively similar to those varieties found outdoors. The presence of one or more fungal species indoors that are not found outdoors suggests the presence of an amplifier in the building.

An additional resource that places numerical limits on acceptable indoor fungal spores is found in the Calgary Health Region's guidelines for *Fungal Air Testing, Investigation and Reporting* for remediated marijuana grow houses. These guidelines suggest that indoor fungal spores are acceptable if found to be elevated by as much as 2 or 3 times the outdoor measurement, depending on the type of mould spore. Refer to attached guidelines.

The Canadian Construction Association (CCA) has provided guidelines regarding investigation and remediation works in *CCA82 - 2004 Mould Guidelines for the Canadian Construction Industry* to protect the health and safety of workers who may be exposed to mould in the course of building renovations.

#### 3.13.1 Findings

During the current investigation, no visible mould or favourable conditions for mould growth were observed in the surveyed areas.

#### 3.13.2 Recommendations

No immediate corrective action is recommended with regard to mould contamination.

## 4. CORRECTIVE ACTIONS

No corrective actions were recommended.

## 5. STATEMENT OF LIMITATIONS

Fisher Environmental Ltd. accepts responsibility for the competent performance of its duties in executing this assignment within the normal standards of the profession, but disclaims responsibility for consequential damages, if any.

The extent of the building survey of asbestos containing materials (ACM) and other designated substances is based on prior agreement of the scope of work with the client, and the rationale given in this report. The building survey findings rely on professional interpretation of selective sampling and analysis. Sample analysis results have been applied to homogenous materials in unsampled locations; it was not within the scope of work to carry out an exhaustive sampling and analysis program. For non-accessible building spaces, the likelihood of the presence or absence of asbestos and other designated substances has been described, but such assessment is not a definitive statement of presence or absence.

This report was prepared for the City of Toronto, Facilities Management. The scope of services performed may not be appropriate for the purposes of other users, and any use or reuse of this document or its findings or recommendations represented herein is at the sole risk of any other user.

We trust that the information provided in the report meets your current requirements. If you have any questions or concerns, please do not hesitate to contact the undersigned.

## 6. SIGN-OFF

We trust that this report meets with City of Toronto requirements and we thank you for the opportunity to be of service. Should you have any questions, please do not hesitate to contact us.

Fisher Environmental Ltd.

## 1.0. EXECUTIVE SUMMARY

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work area(s) for City Clerk's Record Center located at 14 Dyas Road, Toronto, Ontario, herein after referred to as the "Site". The site inspection and sampling works were conducted on March 10, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

### **Asbestos**

Fisher was provided with the report of a previous DSS, which was conducted by ECOH Environmental Ltd. on September 2, 2014. This report indicates no identified assumed or confirmed ACM within the specified work area(s).

During the current survey, six (6) bulk samples of building materials found within the specified work area(s) and that could potentially contain asbestos, were collected and submitted to Fisher Environmental Laboratories for Polarised Light Microscopy (PLM) analysis, as outlined in NIOSH Method 9002.

The results of analysis revealed that each material sampled does not contain asbestos. Provide a copy of this report to contractors bidding on or performing work within the subject work areas.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

### **Lead**

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current

survey, two (2) bulk samples of yellow and grey paint found within the specified work area(s) were collected and submitted to Fisher Environmental Laboratories for lead analysis. The results of analysis revealed that yellow paint contains 21 ppm of lead, and grey paint contains <10 ppm of lead.

Fisher recommends that, prior to the planned renovation work, the removal of lead containing materials found within the specified work area(s), must be conducted using the appropriate lead abatement procedures. Lead abatement procedures to be used are determined by the method(s) of disturbance employed. Refer to *MOL Guideline: Lead on Construction Projects*, for details

### **Mercury**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey. Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

### **Silica**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings. If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to *MOL Guideline: Silica on Construction Projects* for details.

### **Other Designated Substances**

The other Designated Substances would not be expected to be present at the Site. No immediate actions were recommended with regard to acrylonitrile, arsenic, benzene, coke oven emissions, ethylene oxide, isocyanates, and vinyl chloride.

### **Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work area(s). No action is recommended with regard to mould.

## 2.0. INTRODUCTION

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work area(s) for City Clerk's Record Center located at 14 Dyas Road, Toronto, Ontario, herein after referred to as the "Site". The site inspection and sampling works were conducted on March 10, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

## 3.0. REGULATIONS

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

The OHSA, R.S.O. 1990, under the Ontario MOL, defines a toxic substance as a biological, chemical or physical agent (or a combination of such agents) whose presence in the workplace may endanger the health and safety of a worker. Sections of the Act that deals with toxic substances are intended to:

1. ensure that worker exposure to toxic substances is controlled;
2. ensure that toxic substances in the workplace are clearly identified and that workers are provided with enough information to be capable of handling them safely; and,
3. provide the general public with access to information about toxic substances used by industry in their communities.

The Act makes provision for a toxic substance to be "designated", where its use in the workplace is prohibited, regulated, restricted, limited or controlled. Designation is reserved for eleven substances that are particularly hazardous, covered under O. Reg 490/09 – *Designated Substances* that was implemented on July 1, 2010, and include Acrylonitrile, Arsenic, Asbestos, Benzene, Coke Oven Emissions, Ethylene Oxides, Isocyanates, Lead, Mercury, Silica, and Vinyl Chloride. Formerly, regulations for these substances were passed separately and each outlined exposure limits where workers were likely to inhale, ingest and / or absorb the substance.

O. Reg. 490/09 provides a consistent approach to dealing with existing requirements and provisions, and outlines steps required to control worker exposure to these substances, including by inhalation, ingestion, skin absorption or skin contact. Each designated substance has an allowable level of exposure based on a time-weighted average (TWA) limit, and may also have a short-term exposure limit (STEL) and / or ceiling limit (C) assigned to it. TWA refers to the time-weighted average airborne concentration of a biological or chemical agent to which a worker may be exposed in a work day or work week, STEL refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed in any 15 minute period, and C refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed at any time. Refer to O. Reg. 490/09 – *Designated Substances*.

A supplementary regulation regarding control of asbestos exposures in the construction industry has evolved into O. Reg. 278/05 – *Asbestos on Construction Projects and in Buildings and Repair Operations*. The regulation includes a definition of asbestos-containing materials (ACM), requirements for additional training and clearance air testing, procedures for determining materials that meet the definition of ACM and for the use of glove bags, and provisions for varying from measure and procedures set out in the regulation.

In addition to the OHSA and regulations regarding designated substances, the following regulations, guidelines and standards were also taken into account or referenced:

- O. Reg. 213/91 - *Construction Projects* regulated under the OHSA and last amended by O. Reg. 443/09;
- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*;
- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes;
- MOL *Guideline: Lead on Construction Projects*, 2011; and,
- MOL *Guideline: Silica on Construction Projects*, 2011.

## 4.0. METHODOLOGY

Fisher followed the protocols outlined in O. Reg. 278/05 for collecting and analyzing bulk samples of materials suspected to contain asbestos. Visual assessment of the material was the primary method of identification with occasional physical contact for the purpose of collecting bulk samples or examining for underlying layers.

Where applicable, samples of suspect materials were collected in order to establish asbestos or lead content. Samples were grouped according to similarity of appearance (“homogeneous” materials). The frequency at which the samples were collected was sufficient to obtain a general representation of the presence of these materials at the Site. Samples collected are presumed to

be representative of respective building materials in-place at the Site. However, due to potential past renovations, alterations, repairs, or phases of construction, it is possible that individual materials may not be representative of samples collected.

Sampling of roofing materials was not part of the current scope of work. Further, sampling of materials found within operating equipment, portable building articles, or generally non-accessible components such as insulation within electrical switch gears, wiring, motors, light fixtures, elevator brakes, fire door cores, etc. was not performed as part of the current survey.

Samples collected during the survey were placed in plastic zip-lock bags which were labeled and submitted for laboratory analysis. Fisher Environmental Laboratories analysed bulk samples for asbestos type and approximate percent content by performing polarized light microscopy (PLM), as outlined in NIOSH Method 9002. Fisher Environmental Laboratories analysed samples for lead content in paint by performing acid digestion followed by Inductively Coupled Plasma (ICP) analysis.

Site Plan(s), indicating specific work area(s), bulk sample locations and any area(s) of asbestos, are included in Appendix A. The laboratory certificate(s) of analysis are included in Appendix B. Representative photos of Site conditions encountered at the time of the current survey are included in Appendix C.

## **5.0. REVIEW OF PREVIOUS REPORTS**

Fisher was provided with the report of a previous DSS, which was conducted by ECOH Environmental Ltd. on September 2, 2014, attached in Appendix D. This report indicates no identified assumed or confirmed ACM within the specified work area(s).

## **6.0. FINDINGS AND RECOMMENDATIONS**

### **6.1. *Acrylonitrile***

Acrylonitrile would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Acrylonitrile are warranted at this time.

### **6.2. *Arsenic***

Arsenic would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Arsenic are warranted at this time.

### **6.3. *Asbestos***

#### **6.3.1. General Information**

Asbestos is the name given to a group of six different fibrous minerals (amosite, chrysotile, crocidolite, and the fibrous varieties of tremolite, actinolite and anthophyllite) that occur naturally

in the environment. Asbestos minerals have separable long fibres that are strong and flexible enough to be spun and woven and are heat resistant.

Because of these characteristics, asbestos has been used for a wide range of manufactured goods, mostly in building materials (roofing shingles, ceiling and floor tiles, paper products, and asbestos cement products), friction products (automobile clutch, brake, and transmission parts), heat-resistant fabrics, packaging, gaskets, and coatings. Some vermiculite or talc products may also contain asbestos.

Asbestos fibres may be released into the air by the disturbance of ACM during product use, renovation or demolition work, building or home maintenance, repair and remodeling. In general, exposure may occur only when the ACM is disturbed in some way to release particles and fibres into the air.

### **6.3.2. Friable vs. Non-Friable ACM**

Based on the requirements of O. Reg. 278/05 and due diligence, an asbestos survey and report must be available at any workplace where asbestos exists identifying locations and types of ACM in the building. The survey must include both friable and non-friable materials confirmed to contain asbestos, as well as any other materials which were not sampled but are suspected (presumed) ACM. The term friable refers to material(s) that could be readily reduced to dust or powder when crushed by hand or moderate pressure. Friable materials have a much greater chance of releasing airborne asbestos fibres when disturbed.

In the past, the most commonly used friable asbestos-containing building materials were surfacing materials (e.g. sprayed on fireproofing, texture, decorative or acoustic plaster) as well as thermal insulation. Examples of manufactured asbestos-containing materials include vinyl floor tiles, ceiling tiles, gasket materials, asbestos cement (transite) pipes or boards, and asbestos textiles. Depending on the above noted formulation, these materials range from non-friable to friable. Although some products are considered non-friable when in Good condition, severe damage or deterioration may cause non-friable materials to generate airborne dust more readily. Severely damaged non-friable materials, or those to be worked on with powered tools, may be considered as friable ACM for abatement purposes.

Examples of common types of ACM by friability include:

- Friable ACM
  - Sprayed Materials (or materials installed by roller or trowel), such as fireproofing, thermal insulation, texture finishes, etc.
  - Mechanical Insulation such as boiler and breeching, ductwork, piping, tanks and associated equipment.
  - Plaster

- Potentially Friable ACM
  - Acoustic Ceiling Tiles
  - Vinyl Sheet Flooring
- Non-Friable ACM
  - Vinyl Floor Tiles
  - Asbestos cement (“transite”) piping or paneling
  - Window Caulking

### 6.3.3. Regulations

Exposure to asbestos is controlled by two Regulations passed under Ontario’s Occupational Health and Safety Act (OHSA), R.R.O. 1990.

- O. Reg. 490/09 – *Designated Substances* regarding asbestos applies to:
  - every employer operating a mine for the purpose of mining, crushing, grinding or sifting asbestos;
  - every employer processing, adapting or using asbestos in connection with manufacturing or assembling of goods or products;
  - every employer engaged in the repair, alteration or maintenance of machinery, equipment, aircraft, ships, locomotives, railway cars and vehicles;
  - every employer engaged in work on a building that is necessarily incidental to the repair, alteration or maintenance of machinery or equipment; and,
  - to those workers of such employers who are likely to be exposed to asbestos.

Exposure limits for this substance are set at 0.1 f/cc (TWA) for all types of asbestos.

- O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* applies to buildings that contain friable and non-friable ACM and to the repair, alteration and/or maintenance of these buildings.

In addition to regulations for controlling work around asbestos-containing building materials there are regulations for packaging, transportation and disposal of asbestos-containing waste:

- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*; and,
- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes.

### 6.3.4. Findings

Samples of homogenous materials suspected to contain asbestos were collected and submitted for analysis. Fisher collected six (6) bulk samples of building materials found within the specified work area(s) and that could potentially contain asbestos.

Findings of all building materials identified within the specified work area(s) are outlined in further detail below.

#### **6.3.4.1. Sprayed or Troweled Fireproofing and Thermal Insulation**

No indication of sprayed or troweled fireproofing and / or thermal insulation was noted in any of the specified work area(s) during the current survey.

#### **6.3.4.2. Texture Finish**

No texture finish was noted in any of the specified work area(s) during the current survey.

#### **6.3.4.3. Mechanical Insulation**

The majority of mechanical insulation observed throughout the building are either not insulated or are insulated with fibreglass which is not suspected to contain asbestos.

#### **6.3.4.4. Acoustic Ceiling Tile**

During the current survey, one (1) visually distinct style of ceiling tiles was observed within the specified work areas.

- Ceiling Tile 1 (2'x4' Small Hole & Random Small Fissure)

The previous report confirmed that Ceiling Tile 1 was sampled for analysis. The results of analysis revealed this style of ceiling tile does not contain asbestos.

#### **6.3.4.5. Plaster / Drywall Joint Compound**

Plaster was not observed within the specified work areas during the survey. Drywall Joint Compound (DJC) was observed throughout the building. The previous report indicated that DJC was sampled for analysis. The results of analysis revealed that the DJC does not contain asbestos.

#### **6.3.4.6. Asbestos Cement Products**

No asbestos cement products, such as Transite pipe or board, were noted in any of the specified work area(s) during the current survey.

#### **6.3.4.7. Vinyl Sheet Flooring**

No vinyl sheet flooring was noted in any of the specified work area(s) during the current survey.

#### **6.3.4.8. Vinyl Floor Tile**

No vinyl floor tile was noted in any of the specified work area(s) during the current survey.

#### **6.3.4.9. Other ACM**

##### Mortar

Mortar was observed on the brick wall in the Vestibule. Three (3) samples of the mortar were collected for analysis. The results of analysis revealed that the mortar does not contain asbestos.

### White Caulking

White caulking was observed around the sink in the Washroom. Three (3) samples of the white caulking were collected for analysis. The results of analysis revealed that the white caulking around the sink does not contain asbestos.

### **6.3.5. Recommendations**

No asbestos-containing materials were identified in any of the specified work area(s). Therefore, no recommendations with regards to ACM are warranted at this time.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

The presence of ACM should be presumed in locations not accessed during this survey. It is possible that ACM is present at the Site that is not identified in this report. Should additional suspected ACM be discovered, it should be presumed as ACM until sample analysis determines asbestos content.

Due to the limited nature of the current scope of work and the presence of solid building finishes (i.e. plaster or drywall walls and ceilings etc.) in many locations, the full extent of ACM may not be confirmed. Precautions should be taken when dismantling solid wall or ceiling finishes, or any other building surfaces which may conceal potential ACM. Such precautions include, but are not limited to, isolation measures and appropriate personal protective equipment.

### **6.4. Benzene**

Benzene would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Benzene are warranted at this time.

### **6.5. Coke Oven Emissions**

Coke oven emissions would not be expected to be present at the Site and were not observed during the current survey. No recommendations for coke oven emissions are warranted at this time.

### **6.6. Ethylene Oxides**

Ethylene oxides would not be expected to be present at the Site and were not observed during the current survey. No recommendations for ethylene oxides are warranted at this time.

### **6.7. Isocyanates**

Isocyanates would not be expected to be present at the Site and were not observed during the current survey. No recommendations for isocyanates are warranted at this time.

## **6.8. Lead**

### **6.8.1. General Information**

Lead is a naturally occurring bluish–gray metal found in small amounts in the earth’s crust. Most lead in the environment comes from human activities such as burning fossil fuels, mining and manufacturing. Lead is used in the production of batteries, ammunition, metal products (solder and pipes) and X-ray devices.

Lead does not break down but lead compounds are changed by sunlight, air and water. Exposure occurs when eating food or drinking water that contains lead. Deteriorated lead paint can contribute to lead dust. The main target for lead toxicity is the nervous system.

### **6.8.2. Regulations and Guidelines**

The Ontario MOL has not prescribed criteria defining an analyzed sample of bulk material as “lead-containing”. Further, the MOL has not established a lower limit for concentrations of lead in paint, below which precautions do not need to be considered during construction projects. However, except for very aggressive disturbance of painted finishes, (e.g., abrasive blasting, torch cutting, or grinding), Fisher believes that a lead content below 0.1% by weight (1,000 ug/g or 1000 ppm) represents a concentration in which the lead content is not the limiting hazard for construction hygiene purposes. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations.

The regulation for the designated substance lead applies to every employer and worker at a workplace where lead is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to lead. Exposure limits for this substance are set at 0.05 – 0.10 mg/m<sup>3</sup> (TWA) depending on the type of lead, and for tetraethyl lead 0.30 mg/m<sup>3</sup> (STEL).

Additionally, in 2011 the MOL revised *Guideline: Lead on Construction Projects* outlining practices that should be followed during construction projects to protect workers from exposure to lead. This includes the methods and equipment employed in the removal of lead-containing coatings that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **6.8.3. Findings**

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles.

During the current survey, two (2) bulk samples of yellow and grey paint found within the work areas were collected and submitted to Fisher Environmental Laboratories for lead analysis. The results of analysis revealed that yellow paint contains 21 ppm of lead, and grey paint contains <10 ppm of lead.

### 6.8.4. Recommendations

Where any lead-containing materials may be disturbed or removed, Fisher recommends that appropriate lead abatement procedures be used. The lead abatement procedures to be used are determined by the method(s) of disturbance employed. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations. The table below outlines lead abatement operations and associated respirator required, as outlined in Ontario MOL guidelines.

#### Classifications of Lead-Containing Operations and Required Respirator

<b>Type 1 Operations</b> (where concentrations of airborne lead would be expected to be < 0.05 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>Removal of lead containing coatings with chemical gel or paste and fibrous laminated cloth wrap</li> <li>Removal of lead containing coatings / materials using power tool that has an effective dust collection system equipped with HEPA filter</li> <li>Removal of lead containing coatings / materials using non-powered hand tools other than manual scraping or sanding</li> </ul>	Respirators should not be necessary if general procedures are followed and level of air is less than 0.05 mg/m <sup>3</sup> . However, if worker wishes to use a respirator, a half-mask particulate respirator with N-, R- or P-series filter, and 95, 99 or 100% efficiency should be provided.
<b>Type 2a Operations</b> (where concentrations of airborne lead would be expected to be > 0.05 to 0.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>Removal of lead containing coatings / materials by scraping or sanding using non-powered hand tools</li> <li>Manual demolition of lead painted plaster walls / building components by striking with a sledgehammer or similar tool</li> </ul>	NIOSH APF = 10 Half-mask particulate respirator with N-, R- or P- series filter, and 95, 99 or 100% efficiency.
<b>Type 2b Operations</b> (where concentrations of airborne lead would be expected to be > 0.50 to 1.25 mg/m <sup>3</sup> )	
Not applicable to potential renovation activities.	
<b>Type 3a Operations</b> (where concentrations of airborne lead would be expected to be > 1.25 to 2.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>Welding or high temperature cutting of lead-containing coatings or materials indoors or in a confined space.</li> <li>Dry removal of lead-containing mortar using an electronic or pneumatic cutting device.</li> <li>Burning of a surface containing lead</li> <li>Removal of lead containing coatings / materials using power tools without an effective dust collection system equipped with HEPA filter</li> </ul>	NIOSH APF = 50 Full-face piece air-purifying respirator with N-, R- or P- series filter and 100% efficiency. Tight-fitting powered air-purifying respirator with high efficiency filter. Full-face piece supplied-air respirator operated in demand mode. Half-mask or full-face piece supplied air respirator operated in continuous-flow mode.
<b>Type 3b Operations</b> (where concentrations of airborne lead would be expected to be > 2.50 mg/m <sup>3</sup> )	
Abrasive blasting of lead-containing coatings or materials.	NIOSH APF >=1000 Type CE abrasive-blast supplied respirator operated in a positive pressure mode with a tight-fitting half-mask face piece.

Refer to MOL *Guideline: Lead on Construction Projects, 2011*, for details of the Ministry's health and safety guidelines regarding lead.

## **6.9. Mercury**

### **6.9.1. General Information**

Mercury is a naturally occurring metal. It is a shiny, silver-white and odourless liquid. It combines with other elements to form inorganic compounds or salts. Metallic mercury is used to produce chlorine gas and caustic soda, and is used in thermostats and thermometers, fluorescent light bulbs, dental fillings and batteries. Exposure occurs when eating fish or shellfish contaminated with methyl mercury, breathing vapors from spills, incinerators, etc.

The nervous system is very sensitive to all forms of mercury. Exposure to high levels of metallic inorganic or organic mercury can permanently damage the brain, kidneys and developing fetus. Short-term exposure may cause lung damage, nausea, vomiting and diarrhea as well as skin and eye irritation.

### **6.9.2. Regulations**

The regulation for mercury applies to every employer and worker at a workplace where mercury is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to mercury. Exposure limits for this substance are set at 0.025 – 0.01 mg/m<sup>3</sup> (TWA) for all forms of mercury excluding alkyl, and for alkyl compounds of mercury 0.03 mg/m<sup>3</sup> (STEL).

### **6.9.3. Findings**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey.

### **6.9.4. Recommendations**

Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

## **6.10. Silica**

### **6.10.1. General Information**

Silica is a crystalline compound occurring abundantly as quartz, sand, and many other minerals, and used to manufacture a variety of materials, especially glass and concrete. When mining this substance, silica can be deadly when it becomes airborne. If inhaled, silica dust can cause silicosis which can be fatal.

Some of the following industries have a high potential for risk to workers: construction (sandblasting, rock drilling, masonry work, jack hammering, tunneling), mining (cutting or drilling through sandstone or granite), foundry work (grinding, mouldings, shakeout, core room), stone cutting (sawing, abrasive blasting, chipping, grinding), manufacturing and use of abrasives, etc.

### **6.10.2. Regulations**

The regulation for silica applies to every employer and worker at a workplace where silica is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to silica. Exposure limits for this substance are set at 0.05 - 0.10 mg/m<sup>3</sup> (TWA), depending on the type of silica.

Additionally, in 2011 the MOL revised *Guideline: Silica on Construction Projects* outlining practices that should be followed during construction projects to protect workers from exposure to silica. This includes the methods and equipment employed in the removal of silica-containing materials that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **6.10.3. Findings**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings.

### **6.10.4. Recommendations**

If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to MOL *Guideline: Silica on Construction Projects* for details.

## **6.11. Vinyl Chloride**

Vinyl chloride would not be expected to be present at the Site and was not observed during the current survey. No recommendations for vinyl chloride are warranted at this time.

## **6.12. Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work area(s). No action is recommended with regard to mould.

## 7.0. LIMITATIONS

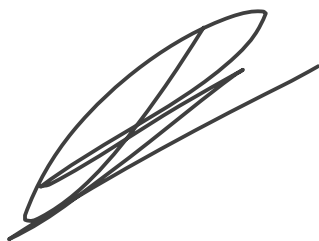

Fisher Environmental Ltd. accepts responsibility for the competent performance of its duties in executing this assignment within the normal standards of the profession, but disclaims responsibility for consequential damages, if any.

The scope of the survey is based on prior agreement with the client, and the rationale given in this report. The survey findings rely on professional interpretation of selective sampling and analysis. Sample analysis results have been applied to homogenous materials in unsampled locations; it was not within the scope of work to carry out an exhaustive sampling and analysis program. For non-accessible building spaces, the likelihood of the presence or absence of asbestos and other designated substances has been described, but such assessment is not a definitive statement of presence or absence.

This report was prepared for the IBI Group. The scope of services performed may not be appropriate for the purposes of other users, and any use or reuse of this document or its findings or recommendations represented herein is at the sole risk of any other user.

We trust that the information provided in the report meets your current requirements. If you have any questions or concerns, please do not hesitate to contact the undersigned.

Respectfully submitted,

Renata Stec, M.Sc.  
Project Manager

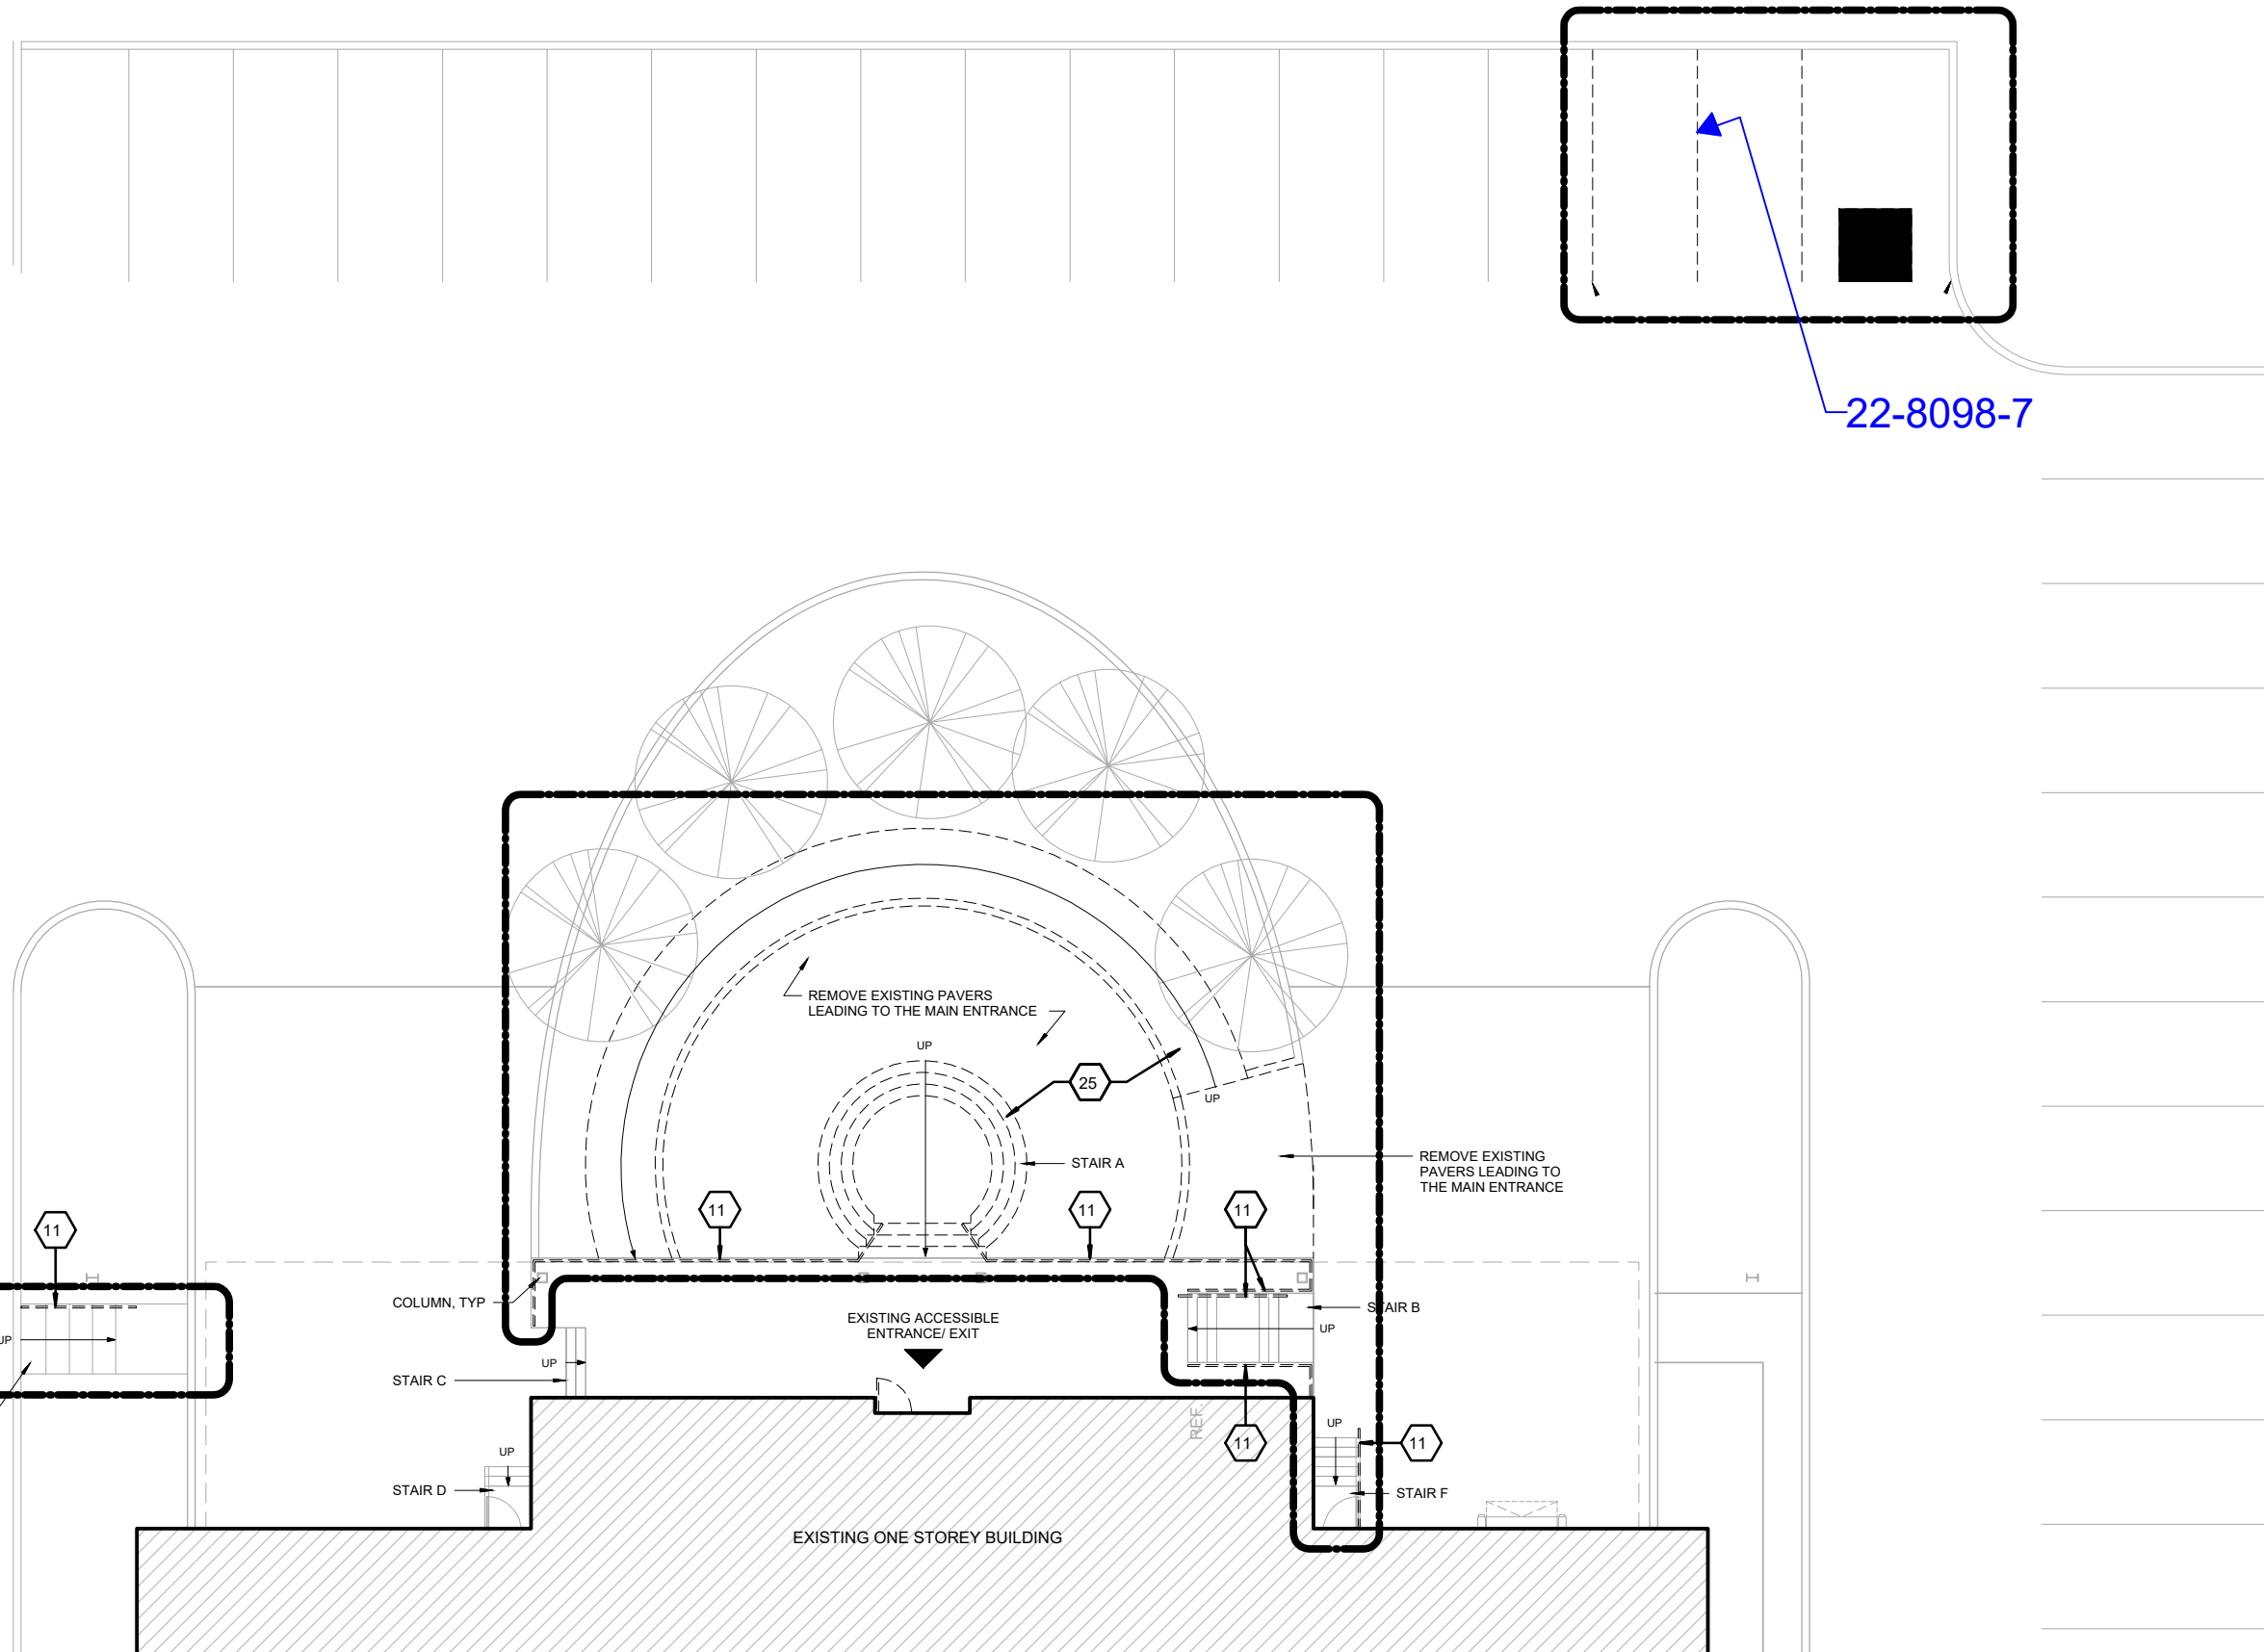

David Fisher, P. Eng., C. Chem.  
Principal

Facilities Management

ECOH Inc.  
Project: 15170-B49

November 14, 2014

## EXECUTIVE SUMMARY

---

ECOH was retained by The City of Toronto to conduct a survey for designated substances and hazardous materials at the City Clerks Facility, located at 14 Dyas Road in Toronto, Ontario (hereafter referred to as the “facility” or the “project area”).

The objective of the survey was to determine the condition of previously identified asbestos-containing materials (ACM), identify and assess the condition of designated substances and other hazardous materials, and, if necessary, provide recommendations to assist the City of Toronto in fulfilling requirements to achieve regulatory compliance, as set forth under the Ontario Occupational Health and Safety Act, and enforced by the Ontario Ministry of Labour. This document should be filed as an addendum to the original survey report, which was issued by Fischer Environmental Ltd. in August, 2007.

This designated substances survey report is for management purposes only. It is not intended to be used to establish the presence of designated substances or hazardous materials in building materials prior to demolition or renovation activities. **A pre-renovation/pre-demolition audit of the work area for designated substances and hazardous materials should be conducted prior to any work activities that may disturb building materials potentially containing designated materials or hazardous substances.**

Mr. Jack Liu of ECOH performed the fieldwork on September 2<sup>nd</sup>, 2014.

### FINDINGS

The following presents a brief outline of ECOH’s findings within the facility. Refer to Appendix II for analytical results for asbestos. Refer to the main body of the report and Appendices I and IV for specific details, quantities and locations of Designated Substances and Hazardous Materials within the facility.

Material	Findings
Asbestos	Assumed ACM were identified in the facility as follows: <ul style="list-style-type: none"><li>Window caulking and roofing materials throughout the facility. These materials were not sampled and should be assumed to be asbestos-containing, as per the project scope of work. All materials were observed to be in GOOD condition at the time of the survey.</li></ul>
Lead	No major sources of lead or lead-containing products were identified during the survey; however, lead may be present in: <ul style="list-style-type: none"><li>Wiring connectors and electric cable sheathing, and</li><li>Piping and solder joints/bell-and-spigot joints on piping.</li></ul>
Mould	Mould growth was not noted during the survey.
Mercury	Minor quantities are present as a vapour within fluorescent tubes lights and as a possible constituent of paints and adhesives.
Silica	Present in all concrete and masonry products.
Polychlorinated Biphenyls (PCBs)	Assumed to be present as a component of ballasts for fluorescent lights/ high-intensity discharge (HID) lights. Approximately 150 light fixtures are present within the facility.
Benzene	No potential sources of Benzene were identified.
Other Designated Substances and Hazardous Materials	Acrylonitrile, Arsenic, Coke Oven Emissions, Ethylene Oxide, Isocyanates, and Vinyl Chloride Monomer were not noted in significant quantities or forms, if at all.

## EXECUTIVE SUMMARY

---

### **PCBs**

PCB-containing light ballasts may legally remain in use until December 31, 2025, if they were already in use in the facility on September 5, 2008. However, it is ECOH's general recommendation that PCB ballasts are proactively removed to eliminate the possibility of ballasts rupturing and requiring costly remediation.

Disposal of fluorescent light ballasts that contain PCBs must follow Ontario Regulation 347, General – Waste Management, Ontario Regulation 362, Waste Management – PCB's, and the amended PCB Regulations, 2008 established under the Canadian Environmental Protection Act, 1999. Disposal of transformers must also follow these regulations, and a qualified contractor, experienced in PCB transformer removal, should be retained to complete this work.

Complete commentary on each of the designated substances in the project area can be found in the body of this report. The executive summary is not intended to substitute for the complete report, nor does it discuss certain specific issues documented in the report.

## 1. INTRODUCTION AND REGULATORY REQUIREMENTS

### 1.1 Introduction and Scope

ECOH was retained by The City of Toronto to conduct a survey for designated substances and hazardous materials at the City Clerks Facility, located at 14 Dyas Road in Toronto, Ontario (hereafter referred to as the “facility” or the “project area”).

The objective of the survey was to determine the condition of previously identified asbestos-containing materials (ACM), identify and assess the condition of designated substances and other hazardous materials, and, if necessary, provide recommendations to assist the City of Toronto in fulfilling requirements to achieve regulatory compliance, as set forth under the Ontario Occupational Health and Safety Act, and enforced by the Ontario Ministry of Labour. This document should be filed as an addendum to the original survey report, which was issued by Fischer Environmental Ltd. in August, 2007.

This designated substances survey report is for management purposes only. It is not intended to be used to establish the presence of designated substances or hazardous materials in building materials prior to demolition or renovation activities. **A pre-renovation/pre-demolition audit of the work area for designated substances and hazardous materials should be conducted prior to any work activities that may disturb building materials potentially containing designated materials or hazardous substances.**

Mr. Jack Liu of ECOH performed the fieldwork on September 2<sup>nd</sup>, 2014.

The survey included an investigation for the presence of designated substances, namely:

- |                        |                                 |
|------------------------|---------------------------------|
| → <i>Asbestos</i>      | → <i>Benzene</i>                |
| → <i>Lead</i>          | → <i>Coke Oven Emissions</i>    |
| → <i>Mercury</i>       | → <i>Ethylene Oxide</i>         |
| → <i>Silica</i>        | → <i>Isocyanates</i>            |
| → <i>Acrylonitrile</i> | → <i>Vinyl Chloride Monomer</i> |
| → <i>Arsenic</i>       |                                 |

And, in addition, investigation for:

- |                |   |
|----------------|---|
| → <i>Mould</i> | → <i>Polychlorinated Biphenyls (PCB)s</i> |
|----------------|---|

The following report details the project regulatory requirements, survey and analytical methodologies, findings and recommendations, and survey statement of limitations.

### 1.2 Regulatory Requirements

Regulatory requirements and guidelines applicable to the designated substances and hazardous materials noted above include, but are not limited to, the following:

- Ontario Occupational Health and Safety Act and applicable Regulations made under the Act including;
  - Designated Substances – Ontario Regulation 490/09, and
  - Designated Substance – Asbestos on Construction Projects and in Buildings and Repair Operations – Ontario Regulation 278/05.

- Ontario Environmental Protection Act, and applicable regulations made under the Act.
  - General – Waste Management – Ontario Regulation 347
  - Waste Management – PCB's – Ontario Regulation 362.
- Canadian Environmental Protection Act, 1999 and applicable Regulations made under the Act, including:
  - PCB Regulations (SOR/2008-273), amended Dec 8, 2011.
- Ministry of Labour Guideline, "*Lead on Construction Projects*", dated April 2011,
- Ministry of Labour Guideline, "*Silica on Construction Projects*", dated April 2011.
- Canadian Construction Association, Standard Construction Document CCA 82, 2004; "*Mould Guidelines for the Canadian Construction Industry*",
- Environmental Abatement Council of Ontario (EACO) *Mould Abatement Guidelines*, Ed. 2, 2010.
- Environment Canada Document, "*PCB Identification of Lamp Ballasts Containing PCBs*", EPS 2/CC/2, dated August 1991.
- Environment Canada Document, "*Handbook on PCBs in Electrical Equipment*" EN 47-310/1988E, dated April 1988.

## 2. SURVEY METHODOLOGY

### 2.1 General Approach

To ensure familiarity with the building, and prior to commencing the survey, the surveyor made reference to previous surveys, facility floor plans, and other available documentation. The surveyor looked for the most common applications of building materials made with Designated Substances based on historical applications. The investigation performed was non-intrusive in nature (i.e. did not include demolition of building systems to verify concealed conditions).

### 2.2 Asbestos Survey Methodology

#### 2.2.1 Asbestos Sampling Strategy and Analytical Methods

Where sampling was required, bulk samples of potentially asbestos-containing materials were collected for analysis. As per the requirements of Ontario Regulation 278/05: multiple samples (ranging from 3 to 7 depending on quantity and type of material) are required to confirm that asbestos is not present in that given material. Only one positive result (i.e. confirming the presence of asbestos) is required to classify a material as asbestos-containing. Therefore, ECOH's sampling strategy involves the collection of sufficient numbers of samples to meet regulatory requirements, followed by instructions to the laboratory to cease analysis of all remaining samples within a series when a sample within that series is determined to be asbestos-containing.

Sampling requires a small volume of material to either be removed from a damaged section of suspect material or cut from intact material, which is then repaired by sealing with tape to prevent fibre release. The collected samples are placed in plastic bags, sealed, and shipped to an independent laboratory. A formal chain of custody procedure is maintained between ECOH and the sub-contracted laboratory during sample transport. Samples are analysed following the analytical procedure prescribed by the Regulation 278/05 U.S. Environmental Protection Agency Test Method EPA/600/R-93/116: Method for the Determination of Asbestos in Bulk Building Materials. June 1993. Although not required by provincial regulation, all laboratories used by ECOH are

accredited under the U.S. National Voluntary Laboratory Accreditation Program (NVLAP) to ensure consistent, accurate and defensible results.

Materials confirmed to be asbestos-containing during any previous assessments of the facility (if applicable) were not re-sampled for this survey. Additionally, samples were not collected of materials that were previously confirmed to be non-asbestos per the requirements of Ontario Regulation 278/05.

Non-friable, potentially asbestos-containing materials (including plaster, drywall joint compound, vinyl floor tiles, mastics, window caulking, etc.) were not sampled unless damaged or otherwise deemed necessary by the surveyor(s) or the City of Toronto. Unless sampled, non-friable potentially asbestos-containing materials were assumed to be asbestos-containing.

### 2.3 Lead Methodology

Where sampling was required (ie. where damaged materials were observed), bulk samples of potentially lead-containing materials were collected for analysis by flame atomic absorption spectrometry. The collected samples were placed in plastic bags, sealed, and shipped to an independent laboratory. A formal chain of custody procedure is maintained between ECOH and the sub-contracted laboratory during sample transport. All laboratories used by ECOH are accredited under the U.S. EPA National Environmental Lead Laboratory Accreditation Program (NLLAP) and/or American Industrial Hygiene Association (AIHA) Environmental Lead Laboratory Accreditation Program (ELLAP) to ensure consistent, accurate and defensible results.

Lead concentrations exceeding 1000ppm (0.1%) are considered to indicate the material is “lead-containing” per City of Toronto policy and applicable guidelines.

### 2.4 Mould Assessment

The mould assessment of the project area was conducted in accordance with the Canadian Construction Association, Standard Construction Document CCA 82, 2004; “*Mould Guidelines for the Canadian Construction Industry*”. Although there are no regulatory requirements or guidelines in Ontario for such an assessment, the preceding protocol has become accepted as the industry standard by most experts, consultants, and the Ontario Ministry of Labour.

### 2.5 Assessment for PCBs

The primary sources of PCBs in high concentrations in commercial facilities are ballasts in fluorescent or HID light fixtures, and electrical transformers.

Neither dismantling the lights to investigate the ballasts, nor dismantling the transformers to investigate their interiors, was part of the scope of this survey. A rough count of the number of fluorescent or HID light fixtures in the building was made, and is presented in the findings. Without disassembly, it is impossible to determine whether the ballasts are PCB-containing, and therefore all such light fixtures are assumed to contain PCB ballasts.

Electrical transformers cannot be safely disassembled during a survey such as this. Determination of PCB content relies on the comparison of information on labels and nameplates located on the exterior of the transformer with standard PCB Identifier Code literature. Transformers must be assumed to contain PCB’s if the results of that comparison do not clearly and specifically indicate the transformer does not contain PCB’s.

## 2.6 Hazardous Materials Survey Inventory

ECOH's surveyor completed a mould, lead and asbestos field data sheet for each room entered. The data sheet contains the room name, a unique room number assigned by the surveyor, the quantity, type and condition of potentially hazardous materials present in the room, and sampling information. The inventory sheet is included as Appendix I.

## 2.7 Survey of Other Hazardous Materials

Materials or equipment suspected of containing other Designated Substances and/or PCBs are identified by appearance, age and knowledge of historic applications.

## 3. FINDINGS AND RECOMMENDATIONS

### 3.1 Asbestos

At the request of the City of Toronto, samples of all assumed asbestos-containing materials (ACM) within the facility were collected and analysed for asbestos content.

Assumed ACM identified within the facility includes the following:

- Window Caulking (Non-friable), and
- Roofing Material (Non-friable).

All assumed and/or confirmed ACM were observed to be in GOOD condition at the time of the reassessment.

The following table summarizes the analytical results for the sampled ACM.

<b>TABLE 1</b> Summary of Analysis - Collected Asbestos Bulk Samples			
Sample Number	Sample Location	Sample Description	Results
15170-B49-ASB-01A	1-10 (Warehouse)	Drywall Joint Compound – Wall	None Detected
15170-B49-ASB-01B	1-04 (Women's Washroom)	Drywall Joint Compound – Wall	None Detected
15170-B49-ASB-01C	1-15 (Battery Charging Station)	Drywall Joint Compound – Wall	None Detected
15170-B49-ASB-01D	1-09 (Computer Station)	Drywall Joint Compound – Wall	None Detected
15170-B49-ASB-01E	1-01 (Office Area)	Drywall Joint Compound – Wall	None Detected
15170-B49-ASB-01F	1-03 (Men's Washroom)	Drywall Joint Compound – Wall	None Detected
15170-B49-ASB-02A	1-07 (Server Room)	Ceiling Tile 1 – 2'x4' small hole and random small/medium fissures	None Detected

<b>TABLE 1</b> Summary of Analysis - Collected Asbestos Bulk Samples			
Sample Number	Sample Location	Sample Description	Results
15170-B49-ASB-02B	1-07 (Server Room)	Ceiling Tile 1 – 2’x4’ small hole and random small/medium fissures	None Detected
15170-B49-ASB-02C	1-07 (Server Room)	Ceiling Tile 1 – 2’x4’ small hole and random small/medium fissures	None Detected
15170-B49-ASB-03	1-10 (Warehouse)	Sprayed Fireproofing	None Detected
	Pink highlighted rows, if present, indicate asbestos-containing materials		

The locations and quantities of materials assumed or confirmed to be asbestos-containing can be found in the hazardous materials inventory sheet, which is included as Appendix I.

For the purposes of future renovation and/or demolition activities in specific locations within the facility, any building materials not specifically sampled in the project area should be treated as if their asbestos content is not known. Such materials should, therefore, be sampled prior the occurrence of renovation or demolition work.

Additional asbestos-containing materials may be present in areas of the building which were inaccessible at the time of the survey (ie. above fixed ceilings, behind walls, under flooring, etc.).

### 3.2 Lead

No potentially lead-containing materials were observed to be damaged during the survey, and, therefore, no samples of such materials were collected.

No other significant potential sources of lead or lead-containing products were identified during the survey. However, lead may be present in:

- Wiring connectors and electric cable sheathing, and
- Piping and solder joints or bell joints on piping.

### 3.3 Mould

No mould-affected building materials were observed during the survey.

### 3.4 Mercury

Mercury is present in minor quantities within the project area in the following forms:

- As a vapour within fluorescent light tubes that are present in the project area,
- As a possible constituent of thermostats, and
- As a possible constituent of paints and adhesives.

Items suspected to contain mercury were noted to be in good condition.

### 3.5 Silica

Free crystalline silica, in the form of common construction sand, is present in all concrete and masonry products within the building.

### 3.6 Polychlorinated Biphenyls (PCBs)

The following potential sources of Polychlorinated Biphenyls (PCBs) were identified within the facility. Dismantling lights to investigate ballasts and/or dismantling transformers to investigate their contents, was not part of the scope of this survey. Therefore, the items listed below must be assumed to contain PCBs, unless specifically stated otherwise:

- Electrical transformers:
  - Battery Charging Station, 1-15: Two (2) transformers were observed.
  - Based upon transformer labels/nameplates, it was determined that the above-listed transformers DO NOT contain PCBs.
- Fluorescent light ballasts:
  - Approximately 150 fluorescent light fixtures are present throughout the facility. Ballasts within these fixtures are assumed to contain PCBs.

Additional mechanical equipment or components of mechanical equipment throughout the facility may contain PCBs. These may include, but are not limited to, electrical capacitors and electrical equipment containing capacitors, voltage regulators, switches, re-closers, bushings or electromagnets, cable insulation, heat transfer equipment, hydraulic equipment, vapour diffusion pumps, bridge bearings, and caulking and motor/hydraulic oils. A specific assessment prior to the removal of any mechanical equipment within the facility should be conducted to confirm if PCBs are present within the equipment.

### 3.7 Other Environmental Considerations

The environmental audit also included an investigation for the following compounds, none of which were found to be present:

- |                       |                          |
|-----------------------|--------------------------|
| • Acrylonitrile       | • Ethylene Oxides        |
| • Arsenic             | • Isocyanates            |
| • Coke Oven Emissions | • Vinyl Chloride Monomer |
| • Benzene             |                          |

Please note: paint, adhesives and plastics present throughout the project area may contain trace amounts of Acrylonitrile, Arsenic, Benzene, Ethylene Oxides, Isocyanates, Lead, Mercury and Vinyl Chloride Monomer. However, none of these materials were observed in a hazardous or unsafe condition.

## 4. RECOMMENDATIONS

### 4.1 Asbestos

All assumed and/or confirmed ACM were observed to be in GOOD condition at the time of the reassessment. As such, no corrective actions are recommended at this time.

Ontario Ministry of Labour Regulation 278/05 requires that an Asbestos Management Program (AMP) be implemented as long as asbestos-containing materials are present (or assumed to be present) in a building. The AMP, original survey report and subsequent reassessment reports must

be available at the work place, and must identify the type of asbestos, and where asbestos can be found on a room-by-room basis.

**NOTE:** Interpretation of all sources of asbestos-related information, including but not limited to the original asbestos survey report, asbestos reassessment reports, room-by-room survey data, survey drawings and reports from previous asbestos abatement projects, should be completed by a competent person trained in the historical application of asbestos in building materials, building design and preferably by a person with site-specific knowledge and/or experience.

Information contained within any of the above-noted sources may not relieve the Regulatory responsibility of building Owners, or project Employers/Constructors, to complete a detailed site inspection prior to commencement of a project.

This report should not be used as a substitute for a detailed site inspection to identify asbestos-containing building materials, which must be specifically tailored to the scope and nature of any given project, and completed prior to any maintenance, renovation or demolition work that may cause disturbance to building materials.

#### 4.2 Lead

Renovation, demolition or general construction work involving the removal of materials containing only trace concentrations of lead (ie. Concentrations below 0.1% (1000ppm) by dry weight) can be completed without lead specific safety precautions provided that:

- a) work does not include 'fume generating activities' (heat producing) such as welding, torching, burning, high temperature cutting, etc.,
- b) work does not include dust-generating activities such as grinding, cutting or chemical stripping,
- c) dust levels are maintained below  $3\text{mg}/\text{m}^3$ , and
- d) general health and safety construction procedures are implemented, which would include dust suppression methods, proper respiratory protection (minimum of a 1/2-face respirator) and protective clothing, as is appropriate for the work being completed.

Any work involving the disturbance of building materials assumed to contain lead (e.g. wiring connectors or electric cable sheathing) should be conducted following recommendations detailed within the Ministry of Labour document *Guideline - Lead on Construction Projects*, dated April 2011.

All lead-containing waste materials must be disposed of following requirements set forth in applicable federal and/or provincial regulations, including Ontario Regulation 347: *General – Waste Management*.

#### 4.3 Mercury

The presence of mercury within assembled units (e.g. fluorescent light bulbs and thermostat bulbs) should not be considered a hazard provided that the assembled units remain sealed and intact. Avoid direct skin contact with mercury and avoid inhalation of mercury vapour. If required, dispose of mercury following applicable legislative requirements.

#### 4.4 Silica

Silica-containing building materials are present throughout the facility (e.g. concrete, brick, cement block, etc.). Any work involving the disturbance of materials that may contain silica should be conducted following recommendations detailed in the Ministry of Labour document “*Guideline - Silica on Construction Projects*”, dated September 2004.

#### 4.5 Polychlorinated Biphenyls (PCBs)

Fluorescent light ballasts throughout the facility are assumed to contain PCBs as dismantling the lights were not part of the scope of this survey.

PCB-containing light ballasts may legally remain in use until December 31, 2025, if they were already in use in the facility on September 5, 2008. However, it is ECOH’s general recommendation that PCB ballasts are proactively removed to eliminate the possibility of ballasts rupturing and requiring costly remediation. To determine whether light ballasts contain PCBs, they should be disassembled to observe serial codes and then compared to standard PCB Identifier Code literature. Ballasts with unidentifiable serial codes, or from manufacturers who are not included in the standard PCB Identifier Code literature, or which are not clearly labelled as “PCB Free”, or for which no date is clearly visible (ballasts dated 1981 or later do not contain PCBs), must be assumed to contain PCBs.

Disposal of fluorescent light ballasts that contain PCBs must follow Ontario Regulation 347, General –Waste Management, Ontario Regulation 362, Waste Management – PCB’s, and the amended PCB Regulations, 2008 established under the Canadian Environmental Protection Act, 1999.

Removal of any other PCB-containing substances or equipment in the facility should follow the amended *PCB Regulations*, 2008, made under the *Canadian Environmental Protection Act*, 1999 (CEPA).

#### 4.6 Other Substances

Dust suppression and personal protection procedures should be implemented during the demolition of materials that may contain Acrylonitrile, Arsenic, Benzene, Ethylene Oxides, Isocyanates, and Vinyl Chloride.

### 5. CORRECTIVE ACTIONS

Corrective actions were not conducted.

## 6. STATEMENT OF LIMITATIONS

Due to the nature of building construction, some limitations exist as to the possible thoroughness of the designated substance and hazardous materials survey. The field observations, measurements and analysis are considered sufficient in detail and scope to form a reasonable basis for the findings and conclusions presented in this report. The findings and conclusions drawn by ECOH Inc. (ECOH), concerning the designated substance and hazardous materials survey, are limited to the specific scope of work for which ECOH was retained and are based solely on information generated as a result of the specific scope of work authorized by The City of Toronto. The results of the designated substance and hazardous materials survey are limited to visual inspection of areas made accessible to ECOH personnel and information obtained from facility personnel, when obtained.

ECOH warrants that the findings and conclusions contained herein have been made in accordance with generally accepted evaluation methods in the industry and applicable regulations at the time of the performance of the designated substance survey. However, there is no warranty, expressed or implied, that this building survey has uncovered all environmental considerations on the subject site. In addition, ECOH cannot guarantee the completeness or accuracy of information supplied by a third party.

This report was prepared by ECOH for The City of Toronto. The material in it reflects ECOH's professional interpretation of information available at the time of report preparation. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties.

APPENDIX I - ASBESTOS REASSESSMENT SURVEY FORM

Building Address 14 Dyas Road					Date(s) of Current Reassessment: September 2, 2014				
Building Name City Clerks Facility					Organization completing Asbestos Reassessment: ECOH Inc.				
Summary of Findings All Hazardous Materials Observed in GOOD Condition									
Location Number	Location Name	System	Material Observed	Potential Hazardous Material	Sample ID	Asbestos Type/Content	Quantity	Condition	Notes/Required Action
0-00	Exterior	Roof	Roofing Material	Asbestos	Not Sampled	ACM Assumed	10000 ft²	Good	
0-00	Exterior	Wall	N/A	N/A	N/A	N/A	N/A	N/A	
0-00	Exterior	Windows	Window Caulking	Asbestos	Not Sampled	ACM Assumed	500 ft²	Good	
1-01	Office Area	Floor	Carpet	N/A	N/A	N/A	N/A	N/A	
1-01	Office Area	Wall	Drywall Joint Compound	Asbestos	15170-B49-ASB-01E	None Detected	N/A	N/A	Sampled during ECOH 2014 Reassessment Survey
1-01	Office Area	Ceiling	Ceiling Tile 1	Asbestos	Not Sampled	Visually Consistent with 15170-B49-ASB-02 (None Detected)	N/A	N/A	2'x4' Small hole and random small/medium fissures
1-02	Entrance Foyer	Floor	Ceramic Tiles	Lead	N/A	N/A	N/A	N/A	
1-02	Entrance Foyer	Wall	Brick	N/A	N/A	N/A	N/A	N/A	
1-02	Entrance Foyer	Wall	Wood	N/A	N/A	N/A	N/A	N/A	
1-02	Entrance Foyer	Ceiling	Drywall Joint Compound	Asbestos	Not Sampled	Visually consistent with 15170-B49-ASB-01 (None Detected)	100 ft²	Good	
1-03	Men's Washroom	Floor	Ceramic Tiles	Lead	N/A	N/A	N/A	N/A	
1-03	Men's Washroom	Wall	Drywall Joint Compound	Asbestos	15170-B49-ASB-01F	None Detected	N/A	N/A	Sampled during ECOH 2014 Reassessment Survey
1-03	Men's Washroom	Ceiling	Ceiling Tile 1	Asbestos	Not Sampled	Visually Consistent with 15170-B49-ASB-02 (None Detected)	N/A	N/A	2'x4' Small hole and random small/medium fissures
1-04	Women's Washroom	Floor	Ceramic Tiles	Lead	N/A	N/A	N/A	N/A	
1-04	Women's Washroom	Wall	Drywall Joint Compound	Asbestos	15170-B49-ASB-01B	None Detected	N/A	N/A	Sampled during ECOH 2014 Reassessment Survey
1-04	Women's Washroom	Ceiling	Ceiling Tile 1	Asbestos	Not Sampled	Visually Consistent with 15170-B49-ASB-02 (None Detected)	N/A	N/A	2'x4' Small hole and random small/medium fissures
1-05	Washroom	Floor	Ceramic Tiles	Lead	N/A	N/A	N/A	N/A	
1-05	Washroom	Wall	Drywall Joint Compound	Asbestos	Not Sampled	Visually consistent with 15170-B49-ASB-01 (None Detected)	175 ft²	Good	
1-05	Washroom	Ceiling	Ceiling Tile 1	Asbestos	Not Sampled	Visually Consistent with 15170-B49-ASB-02 (None Detected)	N/A	N/A	2'x4' Small hole and random small/medium fissures

Disclaimer: Due to the nature of the EPA 600 method, asbestos may not be detected in samples containing low levels of asbestos. We strongly recommend that analysis of floor tiles, vermiculite, and/or heterogeneous soil samples be conducted by TEM for confirmation of "None Detected" by PLM. This report relates only to the samples tested and may not be reproduced, except in full, without the written approval of SAI. This report may not be used by the client to claim product endorsement by NVLAP or any other agency of the U.S. government. Estimated MDL is 0.1%.

## 1.0. EXECUTIVE SUMMARY

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work areas for 33 Division of the Toronto Police Services, located at 50 Upjohn Road, Toronto, Ontario, herein after referred to as the "Site". The site inspection and sampling works were conducted on March 8, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

### **Asbestos**

Fisher was provided with the report of a previous DSS, which was conducted by Pinchin Limited (Pinchin) on November 28, 2016. This report has indicated the following previously identified assumed and/or confirmed ACM within the specified work area(s):

- Caulking (windows/doors),
- Vinyl Floor Tile 1, 12"x12" Beige with White and Brown Streaks

During the current survey, twelve (12) bulk samples of building materials found within the specified work areas and that could potentially contain asbestos, were collected and submitted to Fisher Environmental Laboratories for Polarised Light Microscopy (PLM) analysis, as outlined in NIOSH Method 9002. The results of analysis revealed that the black putty along the joints of the glasses and the frames of the door panels at the main entrance and in the office on the 3<sup>rd</sup> floor of the building contains 0.5-5% Chrysotile asbestos.

Based on the current results of laboratory analysis and information provided in the previous report, the following material are found to contain asbestos:

- Vinyl Floor Tile 1 (12"x12" Beige with White and Brown Streaks) within specific work areas.

- Black putty along the joints of the glasses and the frames of the of the door panels at the main entrance and in the office on the 3<sup>rd</sup> floor within the specific work areas.

Based on the findings of the survey, Fisher recommendations are as follows:

- Provide a copy of this report to contractors bidding on or performing work within the subject work areas;
- Remove the asbestos-containing vinyl floor tiles using Type 1 abatement procedures, as outlined in O. Reg. 278/05. Please note that if the vinyl floor tiles would be disturbed by the use of power tools during removal, abatement must be performed using Type 3 abatement procedures as outlined in O. Reg. 278/05.
- Remove the asbestos-containing black putty using Type 1 abatement procedures, as outlined in O. Reg. 278/05.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

### **Lead**

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current survey, four (4) bulk samples of paint were collected and submitted to Fisher Environmental Laboratories for lead analysis. The results of analysis revealed the following:

- Elevated concentration (greater than 1000 ppm or 0.1% by weight) was identified in the yellow paint used for marking the pavement in the parking area.
- Measurable quantity of lead was identified in the brown paint on the door frames, purple paint on the handrail of the ramp and in yellow paint on natural gas pipe, however, below the action limit.

Fisher recommends that, prior to the planned renovation work, the removal of lead containing materials found within the specified work area(s), must be conducted using the appropriate lead abatement procedures. Lead abatement procedures to be used are determined by the method(s) of disturbance employed. Refer to *MOL Guideline: Lead on Construction Projects*, for details

### **Mercury**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was

noted during the current survey. Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

### **Silica**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings. If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to *MOL Guideline: Silica on Construction Projects* for details.

### **Other Designated Substances**

The other Designated Substances would not be expected to be present at the Site. No immediate actions were recommended with regard to acrylonitrile, arsenic, benzene, coke oven emissions, ethylene oxide, isocyanates, and vinyl chloride.

### **Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work area(s). No action is recommended with regard to mould.

## 2.0. INTRODUCTION

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work areas for the 33 Division of the Toronto Police Services, located at 50 Upjohn Road, Toronto, Ontario, herein after referred to as the "Site". The site inspection and sampling works were conducted on March 8, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

## 3.0. REGULATIONS

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

The OHSA, R.S.O. 1990, under the Ontario MOL, defines a toxic substance as a biological, chemical or physical agent (or a combination of such agents) whose presence in the workplace may endanger the health and safety of a worker. Sections of the Act that deals with toxic substances are intended to:

1. ensure that worker exposure to toxic substances is controlled;
2. ensure that toxic substances in the workplace are clearly identified and that workers are provided with enough information to be capable of handling them safely; and,
3. provide the general public with access to information about toxic substances used by industry in their communities.

The Act makes provision for a toxic substance to be "designated", where its use in the workplace is prohibited, regulated, restricted, limited or controlled. Designation is reserved for eleven substances that are particularly hazardous, covered under O. Reg 490/09 – *Designated Substances* that was implemented on July 1, 2010, and include Acrylonitrile, Arsenic, Asbestos, Benzene, Coke Oven Emissions, Ethylene Oxides, Isocyanates, Lead, Mercury, Silica, and Vinyl

Chloride. Formerly, regulations for these substances were passed separately and each outlined exposure limits where workers were likely to inhale, ingest and / or absorb the substance.

O. Reg. 490/09 provides a consistent approach to dealing with existing requirements and provisions, and outlines steps required to control worker exposure to these substances, including by inhalation, ingestion, skin absorption or skin contact. Each designated substance has an allowable level of exposure based on a time-weighted average (TWA) limit, and may also have a short-term exposure limit (STEL) and / or ceiling limit (C) assigned to it. TWA refers to the time-weighted average airborne concentration of a biological or chemical agent to which a worker may be exposed in a work day or work week, STEL refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed in any 15 minute period, and C refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed at any time. Refer to O. Reg. 490/09 – *Designated Substances*.

A supplementary regulation regarding control of asbestos exposures in the construction industry has evolved into O. Reg. 278/05 – *Asbestos on Construction Projects and in Buildings and Repair Operations*. The regulation includes a definition of asbestos-containing materials (ACM), requirements for additional training and clearance air testing, procedures for determining materials that meet the definition of ACM and for the use of glove bags, and provisions for varying from measure and procedures set out in the regulation.

In addition to the OHSA and regulations regarding designated substances, the following regulations, guidelines and standards were also taken into account or referenced:

- O. Reg. 213/91 - *Construction Projects* regulated under the OHSA and last amended by O. Reg. 443/09;
- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*;
- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes;
- MOL *Guideline: Lead on Construction Projects*, 2011; and,
- MOL *Guideline: Silica on Construction Projects*, 2011.

## 4.0. METHODOLOGY

Fisher followed the protocols outlined in O. Reg. 278/05 for collecting and analyzing bulk samples of materials suspected to contain asbestos. Visual assessment of the material was the primary method of identification with occasional physical contact for the purpose of collecting bulk samples or examining for underlying layers.

Where applicable, samples of suspect materials were collected in order to establish asbestos or lead content. Samples were grouped according to similarity of appearance (“homogeneous” materials). The frequency at which the samples were collected was sufficient to obtain a general representation of the presence of these materials at the Site. Samples collected are presumed to be representative of respective building materials in-place at the Site. However, due to potential past renovations, alterations, repairs, or phases of construction, it is possible that individual materials may not be representative of samples collected.

Sampling of roofing materials was not part of the current scope of work. Further, sampling of materials found within operating equipment, portable building articles, or generally non-accessible components such as insulation within electrical switch gears, wiring, motors, light fixtures, elevator brakes, fire door cores, etc. was not performed as part of the current survey.

Samples collected during the survey were placed in plastic zip-lock bags which were labeled and submitted for laboratory analysis. Fisher Environmental Laboratories analysed bulk samples for asbestos type and approximate percent content by performing polarized light microscopy (PLM), as outlined in NIOSH Method 9002. Fisher Environmental Laboratories analysed samples for lead content in paint by performing acid digestion followed by Inductively Coupled Plasma (ICP) analysis.

Site Plan(s), indicating specific work area(s), bulk sample locations and any area(s) of asbestos, are included in Appendix A. The laboratory certificate(s) of analysis are included in Appendix B. Representative photos of Site conditions encountered at the time of the current survey are included in Appendix C.

## **5.0. REVIEW OF PREVIOUS REPORTS**

Fisher was provided with the report of a previous DSS, which was conducted by Pinchin Ltd. on September 27, 2018, attached in Appendix D. This report has indicated the assumed and/or confirmed ACM within the specified work area(s):

- Caulking (windows/doors); and
- Vinyl Floor Tile 1, 12"×12" Beige with White and Brown Streaks.

Details are provided in the summaries found in the asbestos sections of this report.

## **6.0. FINDINGS AND RECOMMENDATIONS**

### **6.1. Acrylonitrile**

Acrylonitrile would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Acrylonitrile are warranted at this time.

## **6.2. Arsenic**

Arsenic would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Arsenic are warranted at this time.

## **6.3. Asbestos**

### **6.3.1. General Information**

Asbestos is the name given to a group of six different fibrous minerals (amosite, chrysotile, crocidolite, and the fibrous varieties of tremolite, actinolite and anthophyllite) that occur naturally in the environment. Asbestos minerals have separable long fibres that are strong and flexible enough to be spun and woven and are heat resistant.

Because of these characteristics, asbestos has been used for a wide range of manufactured goods, mostly in building materials (roofing shingles, ceiling and floor tiles, paper products, and asbestos cement products), friction products (automobile clutch, brake, and transmission parts), heat-resistant fabrics, packaging, gaskets, and coatings. Some vermiculite or talc products may also contain asbestos.

Asbestos fibres may be released into the air by the disturbance of ACM during product use, renovation or demolition work, building or home maintenance, repair and remodeling. In general, exposure may occur only when the ACM is disturbed in some way to release particles and fibres into the air.

### **6.3.2. Friable vs. Non-Friable ACM**

Based on the requirements of O. Reg. 278/05 and due diligence, an asbestos survey and report must be available at any workplace where asbestos exists identifying locations and types of ACM in the building. The survey must include both friable and non-friable materials confirmed to contain asbestos, as well as any other materials which were not sampled but are suspected (presumed) ACM. The term friable refers to material(s) that could be readily reduced to dust or powder when crushed by hand or moderate pressure. Friable materials have a much greater chance of releasing airborne asbestos fibres when disturbed.

In the past, the most commonly used friable asbestos-containing building materials were surfacing materials (e.g. sprayed on fireproofing, texture, decorative or acoustic plaster) as well as thermal insulation. Examples of manufactured asbestos-containing materials include vinyl floor tiles, ceiling tiles, gasket materials, asbestos cement (Transite) pipes or boards, and asbestos textiles. Depending on the above noted formulation, these materials range from non-friable to friable. Although some products are considered non-friable when in Good condition, severe damage or deterioration may cause non-friable materials to generate airborne dust more readily. Severely damaged non-friable materials, or those to be worked on with powered tools, may be considered as friable ACM for abatement purposes.

Examples of common types of ACM by friability include:

- Friable ACM
  - Sprayed Materials (or materials installed by roller or trowel), such as fireproofing, thermal insulation, texture finishes, etc.
  - Mechanical Insulation such as boiler and breeching, ductwork, piping, tanks and associated equipment.
  - Plaster
- Potentially Friable ACM
  - Acoustic Ceiling Tiles
  - Vinyl Sheet Flooring
- Non-Friable ACM
  - Vinyl Floor Tiles
  - Asbestos cement (“transite”) piping or paneling
  - Window Caulking

### 6.3.3. Regulations

Exposure to asbestos is controlled by two Regulations passed under Ontario’s Occupational Health and Safety Act (OHSA), R.R.O. 1990.

- O. Reg. 490/09 – *Designated Substances* regarding asbestos applies to:
  - every employer operating a mine for the purpose of mining, crushing, grinding or sifting asbestos;
  - every employer processing, adapting or using asbestos in connection with manufacturing or assembling of goods or products;
  - every employer engaged in the repair, alteration or maintenance of machinery, equipment, aircraft, ships, locomotives, railway cars and vehicles;
  - every employer engaged in work on a building that is necessarily incidental to the repair, alteration or maintenance of machinery or equipment; and,
  - to those workers of such employers who are likely to be exposed to asbestos.

Exposure limits for this substance are set at 0.1 f/cc (TWA) for all types of asbestos.

- O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* applies to buildings that contain friable and non-friable ACM and to the repair, alteration and/or maintenance of these buildings.

In addition to regulations for controlling work around asbestos-containing building materials there are regulations for packaging, transportation and disposal of asbestos-containing waste:

- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*; and,
- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes.

#### **6.3.4. Findings**

Samples of homogenous materials suspected to contain asbestos were collected and submitted for analysis. Fisher collected twelve (12) bulk samples of building materials found within the specified work areas and that could potentially contain asbestos. Findings of all building materials identified within the specified work area(s) are outlined in further detail below.

##### **6.3.4.1. Sprayed or Troweled Fireproofing and Thermal Insulation**

No indication of sprayed or troweled fireproofing and / or thermal insulation was noted in any of the specified work areas during the current survey.

##### **6.3.4.2. Texture Finish**

Texture finish was observed on the front lobby ceiling within the specific work areas. The previous report confirmed that the texture finish present at the Site does not contain asbestos.

##### **6.3.4.3. Mechanical Insulation**

The majority of mechanical insulation observed throughout the building are either not insulated or are insulated with fiberglass which is not suspected to contain asbestos.

##### **6.3.4.4. Acoustic Ceiling Tile**

During the current survey, two (2) visually distinct styles of ceiling tiles were observed within the specified work areas.

- Ceiling Tile 1 (2'x4' Random Fissure Pattern)
- Ceiling Tile 3 (2'x4' Random Fissures Pattern with Slots).

The previous report confirmed that Ceiling Tile 1 and Ceiling Tile 3 were sampled for analysis. The results of analysis revealed that both styles of ceiling tile do not contain asbestos.

##### **6.3.4.5. Plaster / Drywall Joint Compound**

Plaster was not observed within the specified work areas during the survey. Drywall Joint Compound (DJC) was observed throughout the building. The previous report indicated that DJC samples were collected for analysis. The results of analysis revealed that the DJC does not contain asbestos

##### **6.3.4.6. Asbestos Cement Products**

No asbestos cement products, such as Transite pipe or board, were noted in any of the specified work areas during the current survey.

#### **6.3.4.7. Vinyl Sheet Flooring**

No vinyl sheet flooring was noted in any of the specified work area(s) during the current survey.

#### **6.3.4.8. Vinyl Floor Tile**

During the current survey, five (5) varieties of vinyl floor tile were observed within the specified work areas.

- VFT 1 - 12" x 12", Beige with White and Brown Streaks;
- VFT 2 - 12" x 12", Beige with Purple Smears;
- VFT 3 - 12" x 12", Beige with Orange and Brown Streaks;
- VFT 4 - 12" x 12", Brown with White and Beige Streaks; and
- VFT 5 - 12" x 12", Off- White with Brown Colouring.

All these varieties of vinyl floor tile were previously sampled for analysis. The results of analysis revealed that Vinyl Floor Tile 1 and Vinyl Floor Tile 3 contains 2% Chrysotile asbestos and the remaining varieties of vinyl floor tile do not contain asbestos.

#### **6.3.4.9. Other ACM**

##### Light Cream Caulking

Light cream caulking was observed along the joints of all the door frame and the block walls within the specific work areas on all floors. Three (3) samples of the light cream caulking were collected for analysis. The results of analysis revealed that the cream caulking does not contain asbestos.

##### Black Putty

Black putty was observed along the joints of the glass and the frames of the door panels at the main entrance and in an office on the 3<sup>rd</sup> floor. Three (3) samples of the black putty were collected for analysis. The results of analysis revealed that the black putty contain 0.5-5% Chrysotile asbestos.

##### Grey Putty

Grey Putty was observed along the joints of the glass and the frames of the door panels of an office room on the 3<sup>rd</sup> floor. Three (3) samples of the grey putty were collected for analysis. The results of analysis revealed that the grey putty does not contain asbestos.

##### Dark Brown Caulking

Dark brown caulking was observed around the exterior of the main entrance door frame. Three (3) samples of the dark brown caulking were collected for analysis. The results of analysis revealed that the dark brown caulking does not contain asbestos.

### 6.3.5. Recommendations

Prior to demolition or any renovation activities, all asbestos-containing materials must be removed from the specified work areas in accordance with O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations*, and be disposed of at a MOE licensed landfill in accordance with O. Reg. 558/00 (amending O. Reg. 347, *General – Waste Management*).

Refer to attached Site Plans in Appendix A, which illustrate where the ACM is located within the specified work areas.

Specifically, Fisher recommends the following:

- Provide a copy of this report to contractors bidding on or performing work within the subject work areas;
- Remove the asbestos-containing vinyl floor tiles using Type 1 abatement procedures, as outlined in O. Reg. 278/05. Please note that if the vinyl floor tile will be disturbed by the use of power tools during removal, abatement must be performed using Type 3 abatement procedures as outlined in O. Reg. 278/05.
- Remove the asbestos-containing black putty using Type 1 abatement procedures, as outlined in O. Reg. 278/05.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

The presence of ACM should be presumed in locations not accessed during this survey. It is possible that ACM is present at the Site that is not identified in this report. Should additional suspected ACM be discovered, it should be presumed as ACM until sample analysis determines asbestos content.

Due to the limited nature of the current scope of work and the presence of solid building finishes (i.e. plaster or drywall walls and ceilings etc.) in many locations, the full extent of ACM may not be confirmed. Precautions should be taken when dismantling solid wall or ceiling finishes, or any other building surfaces which may conceal potential ACM. Such precautions include, but are not limited to, isolation measures and appropriate personal protective equipment.

### 6.4. Benzene

Benzene would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Benzene are warranted at this time.

## **6.5.    *Coke Oven Emissions***

Coke oven emissions would not be expected to be present at the Site and were not observed during the current survey. No recommendations for coke oven emissions are warranted at this time.

## **6.6.    *Ethylene Oxides***

Ethylene oxides would not be expected to be present at the Site and were not observed during the current survey. No recommendations for ethylene oxides are warranted at this time.

## **6.7.    *Isocyanates***

Isocyanates would not be expected to be present at the Site and were not observed during the current survey. No recommendations for isocyanates are warranted at this time.

## **6.8.    *Lead***

### **6.8.1.    General Information**

Lead is a naturally occurring bluish–gray metal found in small amounts in the earth’s crust. Most lead in the environment comes from human activities such as burning fossil fuels, mining and manufacturing. Lead is used in the production of batteries, ammunition, metal products (solder and pipes) and X-ray devices.

Lead does not break down but lead compounds are changed by sunlight, air and water. Exposure occurs when eating food or drinking water that contains lead. Deteriorated lead paint can contribute to lead dust. The main target for lead toxicity is the nervous system.

### **6.8.2.    Regulations and Guidelines**

The Ontario MOL has not prescribed criteria defining an analyzed sample of bulk material as “lead-containing”. Further, the MOL has not established a lower limit for concentrations of lead in paint, below which precautions do not need to be considered during construction projects. However, except for very aggressive disturbance of painted finishes, (e.g., abrasive blasting, torch cutting, or grinding), Fisher believes that a lead content below 0.1% by weight (1,000 ug/g or 1000 ppm) represents a concentration in which the lead content is not the limiting hazard for construction hygiene purposes. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations.

The regulation for the designated substance lead applies to every employer and worker at a workplace where lead is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to lead. Exposure limits for this substance are set at 0.05 – 0.10 mg/m<sup>3</sup> (TWA) depending on the type of lead, and for tetraethyl lead 0.30 mg/m<sup>3</sup> (STEL).

Additionally, in 2011 the MOL revised *Guideline: Lead on Construction Projects* outlining practices that should be followed during construction projects to protect workers' from exposure to lead. This includes the methods and equipment employed in the removal of lead-containing coatings that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### 6.8.3. Findings

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current survey, four (4) bulk samples of paints were collected and submitted to Fisher Environmental Laboratories for lead analysis. The results of analysis revealed the following:

- Elevated concentration (greater than 1000 ppm or 0.1% by weight) was identified in the yellow paint used for marking the pavement in the parking area.
- Measurable quantity of lead was identified in the brown paint on the door frames, purple paint on the handrail of the ramp and in yellow paint on natural gas pipe, however, below the action limit.

### 6.8.4. Recommendations

Where any lead-containing materials may be disturbed or removed, Fisher recommends that appropriate lead abatement procedures be used. The lead abatement procedures to be used are determined by the methods of disturbance employed. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations. The table below outlines lead abatement operations and associated respirator required, as outlined in Ontario MOL guidelines.

#### Classifications of Lead-Containing Operations and Required Respirator

<b>Type 1 Operations</b> (where concentrations of airborne lead would be expected to be < 0.05 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Removal of lead containing coatings with chemical gel or paste and fibrous laminated cloth wrap</li> <li>• Removal of lead containing coatings / materials using power tool that has an effective dust collection system equipped with HEPA filter</li> <li>• Removal of lead containing coatings / materials using non-powered hand tools other than manual scraping or sanding</li> </ul>	Respirators should not be necessary if general procedures are followed and level of air is less than 0.05 mg/m <sup>3</sup> . However, if worker wishes to use a respirator, a half-mask particulate respirator with N-, R- or P-series filter, and 95, 99 or 100% efficiency should be provided.
<b>Type 2a Operations</b> (where concentrations of airborne lead would be expected to be > 0.05 to 0.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Removal of lead containing coatings / materials by scraping or sanding using non-powered hand tools</li> <li>• Manual demolition of lead painted plaster walls / building components by striking with a sledgehammer or similar tool</li> </ul>	NIOSH APF = 10 Half-mask particulate respirator with N-, R- or P- series filter, and 95, 99 or 100% efficiency.

<b>Type 2b Operations</b> (where concentrations of airborne lead would be expected to be > 0.50 to 1.25 mg/m <sup>3</sup> )	
Not applicable to potential renovation activities.	
<b>Type 3a Operations</b> (where concentrations of airborne lead would be expected to be > 1.25 to 2.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Welding or high temperature cutting of lead-containing coatings or materials indoors or in a confined space.</li> <li>• Dry removal of lead-containing mortar using an electronic or pneumatic cutting device.</li> <li>• Burning of a surface containing lead</li> <li>• Removal of lead containing coatings / materials using power tools without an effective dust collection system equipped with HEPA filter</li> </ul>	NIOSH APF = 50  Full-face piece air-purifying respirator with N-, R- or P- series filter and 100% efficiency.  Tight-fitting powered air-purifying respirator with high efficiency filter.  Full-face piece supplied-air respirator operated in demand mode.  Half-mask or full-face piece supplied air respirator operated in continuous-flow mode.
<b>Type 3b Operations</b> (where concentrations of airborne lead would be expected to be > 2.50 mg/m <sup>3</sup> )	
Abrasive blasting of lead-containing coatings or materials.	NIOSH APF ≥1000  Type CE abrasive-blast supplied respirator operated in a positive pressure mode with a tight-fitting half-mask face piece.

Refer to MOL *Guideline: Lead on Construction Projects, 2011*, for details of the Ministry's health and safety guidelines regarding lead.

## 6.9. Mercury

### 6.9.1. General Information

Mercury is a naturally occurring metal. It is a shiny, silver-white and odourless liquid. It combines with other elements to form inorganic compounds or salts. Metallic mercury is used to produce chlorine gas and caustic soda, and is used in thermostats and thermometers, fluorescent light bulbs, dental fillings and batteries. Exposure occurs when eating fish or shellfish contaminated with methyl mercury, breathing vapors from spills, incinerators, etc.

The nervous system is very sensitive to all forms of mercury. Exposure to high levels of metallic inorganic or organic mercury can permanently damage the brain, kidneys and developing fetus. Short-term exposure may cause lung damage, nausea, vomiting and diarrhea as well as skin and eye irritation.

### 6.9.2. Regulations

The regulation for mercury applies to every employer and worker at a workplace where mercury is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to mercury. Exposure limits for this substance are set at 0.025 – 0.01 mg/m<sup>3</sup> (TWA) for all forms of mercury excluding alkyl, and for alkyl compounds of mercury 0.03 mg/m<sup>3</sup> (STEL).

### **6.9.3. Findings**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey.

### **6.9.4. Recommendations**

Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

## **6.10. Silica**

### **6.10.1. General Information**

Silica is a crystalline compound occurring abundantly as quartz, sand, and many other minerals, and used to manufacture a variety of materials, especially glass and concrete. When mining this substance, silica can be deadly when it becomes airborne. If inhaled, silica dust can cause silicosis which can be fatal.

Some of the following industries have a high potential for risk to workers: construction (sandblasting, rock drilling, masonry work, jack hammering, tunneling), mining (cutting or drilling through sandstone or granite), foundry work (grinding, mouldings, shakeout, core room), stone cutting (sawing, abrasive blasting, chipping, grinding), manufacturing and use of abrasives, etc.

### **6.10.2. Regulations**

The regulation for silica applies to every employer and worker at a workplace where silica is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to silica. Exposure limits for this substance are set at 0.05 - 0.10 mg/m<sup>3</sup> (TWA), depending on the type of silica.

Additionally, in 2011 the MOL revised *Guideline: Silica on Construction Projects* outlining practices that should be followed during construction projects to protect workers' from exposure to silica. This includes the methods and equipment employed in the removal of silica-containing materials that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **6.10.3. Findings**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings.

#### **6.10.4. Recommendations**

If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to MOL *Guideline: Silica on Construction Projects* for details.

#### **6.11. Vinyl Chloride**

Vinyl chloride would not be expected to be present at the Site and was not observed during the current survey. No recommendations for vinyl chloride are warranted at this time.

#### **6.12. Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work area(s). No action is recommended with regard to mould.

## 7.0. LIMITATIONS

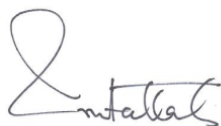

Fisher Environmental Ltd. accepts responsibility for the competent performance of its duties in executing this assignment within the normal standards of the profession, but disclaims responsibility for consequential damages, if any.

The scope of the survey is based on prior agreement with the client, and the rationale given in this report. The survey findings rely on professional interpretation of selective sampling and analysis. Sample analysis results have been applied to homogenous materials in unsampled locations; it was not within the scope of work to carry out an exhaustive sampling and analysis program. For non-accessible building spaces, the likelihood of the presence or absence of asbestos and other designated substances has been described, but such assessment is not a definitive statement of presence or absence.

This report was prepared for the IBI Group. The scope of services performed may not be appropriate for the purposes of other users, and any use or reuse of this document or its findings or recommendations represented herein is at the sole risk of any other user.

We trust that the information provided in the report meets your current requirements. If you have any questions or concerns, please do not hesitate to contact the undersigned.

Respectfully submitted,

Iqbal Fattah, M.Sc.  
Project Manager

David Fisher, P. Eng., C. Chem.  
Principal

## EXECUTIVE SUMMARY

The City of Toronto (Client) retained Pinchin Ltd. (Pinchin) to conduct a Designated Substance survey of 33 Division located at 50 Upjohn Road, Toronto ON. The survey was performed on November 28, 2016.

The objective of the survey was to document the locations of specified Designated Substances, polychlorinated biphenyls (PCBs) and mould, evaluate their condition, and develop corrective action plans as required for the purposes of long term management. The results of this survey are not intended for construction, renovation, demolition or project tendering purposes.

The survey area consisted of the entire building. The building was occupied at the time of the survey.

## SUMMARY OF FINDINGS

Asbestos: Asbestos-containing materials (ACM) were confirmed or assumed to be present as follows:

- Roofing materials
- Exterior window caulking
- Asbestos-cement (Transite)
- Vinyl floor tiles
- Acoustic ceiling tiles

Lead: Lead may be present in emergency light batteries.

Silica: Crystalline silica is present in concrete, mortar, brick, masonry, ceramics, granite, asphalt, etc., where present in the building.

Mercury: Mercury vapour is present in fluorescent lamps throughout the building.

Polychlorinated Biphenyls (PCBs): No PCB-containing materials were found.

Mould: No visible mould growth was observed.

## SUMMARY OF RECOMMENDATIONS

The following is a summary of significant recommendations; refer to the body of the report for detailed recommendations.

1. Perform a pre-construction survey and remove all ACM prior to alteration or maintenance work or if ACM may be disturbed by the work.
2. Remove and dispose of mercury-containing items when taken out of service.

**Designated Substances Survey Report**

33 Division, 50 Upjohn Road, Toronto ON  
The City of Toronto

February 10, 2017  
Pinchin File: 113698.005  
FINAL

3. Follow appropriate safe work procedures when handling or disturbing asbestos, lead, mercury and silica.

Please refer to Section 4.0 of this report for detailed recommendations regarding administrative actions.

*This Executive Summary is subject to the same standard limitations as contained in the report and must be read in conjunction with the entire report.*

## **1.0 INTRODUCTION AND SCOPE**

The City of Toronto (Client) retained Pinchin Ltd. (Pinchin) to conduct a Designated Substances Survey of 33 Division located at 50 Upjohn Road, Toronto ON.

The survey was performed by Joseph Mainwaring, B.A., PCEM, Project Technologist on November 28, 2016. The surveyor was accompanied by a representative of the City of Toronto Facilities during the survey. The building was occupied at the time of the survey.

The objective of the survey was to document any changes in condition and quantity of specified Designated Substances, polychlorinated biphenyls (PCBs) and mould, identified in the previous Designated Substances Survey (Pinchin File 103037), and develop corrective action plans as required. This survey is only to be used for the purposes of long term management and routine maintenance. The results of this survey are not to be used for construction, renovation, demolition or project tendering purposes.

### **1.1 Scope of Survey**

For the purpose of the survey and this report, hazardous building materials include the following Designated Substances:

- Asbestos
- Lead
- Silica
- Mercury

The survey also included:

- Polychlorinated Biphenyls (PCBs)
- Mould

The following Ontario Designated Substances are not typically found in building materials in a composition/state that is hazardous and were not included in this survey:

- Arsenic
- Acrylonitrile
- Benzene
- Coke oven emissions
- Ethylene oxide
- Isocyanates

- Vinyl chloride monomer

## 2.0 BACKGROUND INFORMATION

### 2.1 Building Description

Item	Details
Building Use	Police Station
Number of Floors/Levels	Two stories plus one below grade
Total Area of Building	Approximately 26,000 square feet
Year of Construction	1984
Structure	Structural steel and concrete
Exterior Cladding	Pre-cast concrete, glass curtain wall, brick
HVAC	Rooftop HVAC units
Roof	Built-up roofing
Flooring	Vinyl floor tile, carpet, ceramic tile, concrete
Interior Walls	Drywall, concrete block
Ceilings	Drywall, acoustic ceiling tile

### 2.2 Inaccessible Locations

The following rooms or areas of the building were not accessible to the surveyor and are therefore not included in the report:

Area or Room	Reason
B-016, Community Storage Room	Locked, unauthorized access
3-013, Utilities Room	Locked, unauthorized access
3-018, Storage Room	Locked, unauthorized access

### 3.0 FINDINGS

#### 3.1 Asbestos

##### 3.1.1 Suspect Building Materials Not Found

The following types of building materials may historically contain asbestos but were not observed in the building and are not discussed in the report findings:

- Spray-applied fireproofing or thermal insulation
- Plaster
- Vinyl sheet flooring

##### 3.1.2 Texture Finishes

Texture finish (Photo 1) is present on drywall ceilings in the Front Lobby (Location 1-017). The texture finish was previously sampled and is non-asbestos (samples 11087-B33-04 to 11087-B33-06).

Photo 1: Non-asbestos texture finish.

##### 3.1.3 Thermal Systems Insulation (TSI)

###### 3.1.3.1 Pipe Insulation

All pipes were either uninsulated or insulated with non-asbestos fibreglass insulation.

###### 3.1.3.2 Duct Insulation

Insulated ducts are not present.

###### 3.1.3.3 Mechanical Equipment Insulation

Mechanical equipment is not insulated.

##### 3.1.4 Acoustic Ceiling Tiles

Four distinct types of acoustic ceiling tile are present in the assessed area, as follows:

Size, Type, Pattern, Photo #	Locations	Sample Number	Asbestos Type
ACT01 – 24" x 48", lay-in acoustic ceiling tile with a random fissure pattern	See Survey Form in Appendix IV for locations	11087-B33-07 to 11087-B33-09	None Detected
ACT02 – 24" x 48", lay-in acoustic ceiling tile with a widthwise fissure and pinhole pattern, Photo 2	See Survey Form in Appendix IV for locations	Date Code 1997	Assumed Asbestos-containing
ACT03 – 24" x 48", lay-in acoustic ceiling tile with a random fissure pattern with slots	See Survey Form in Appendix IV for locations	11087-B33-10 to 11087-B33-12	None Detected
ACT04 – 24" x 48", lay-in white acoustic ceiling tile	See Survey Form in Appendix IV for locations	Not Sampled, Fibreglass	None

Ceiling tiles are considered to be potentially friable and are in good condition.

Photo 2: Assumed asbestos-containing ACT02.

### 3.1.5 Drywall Joint Compound

Drywall (gypsum board) and drywall joint compound is present as a wall and ceiling finish throughout the building. Three samples of drywall joint compound were previously collected (samples 2014-A002A-C) and found to be non-asbestos.

### 3.1.6 Asbestos Cement Products (Transite)

Transite pipe is present as rain water leaders in the Crawl Space (Location B-011). Transite is assumed to contain asbestos based on visual observation.

All Transite is non-friable and in good condition.

### 3.1.7 Vinyl Floor Tile and Mastic

Vinyl floor tiles are present as follows:

Size, Pattern, Colour and Photo Number	Locations	Sample Number	Asbestos Type (tile)	Asbestos Type (mastic)
VFT01 – 12" x 12" beige vinyl floor tile with white and brown streaks, Photo 3	See Survey Form in Appendix IV for locations	2014-A001A-C	Chrysotile	None Detected
VFT02 – 12" x 12" beige vinyl floor tile with purple smears	See Survey Form in Appendix IV for locations	2014-A004A-C	None Detected	None Detected
VFT03 – 12" x 12" beige vinyl floor tile with orange and brown streaks, Photo 4	See Survey Form in Appendix IV for locations	2014-A005A-C	Chrysotile	None Detected
VFT04 – 12" x 12" brown vinyl floor tile with white and beige streaks	See Survey Form in Appendix IV for locations	2014-A006A-C	None Detected	None Detected
VFT05 – 12" x 12" off-white vinyl floor tile with brown colouring, Photo 5	See Survey Form in Appendix IV for locations	2014-A003A-C	None Detected	None Detected

The vinyl floor tiles are non-friable and are in good condition.

Photo 3: Asbestos-containing VFT01 (mastic is non-asbestos).

Photo 4: Asbestos-containing VFT03 (mastic is non-asbestos).

Photo 5: Non-asbestos VFT05 and mastic.

### 3.1.8 *Assumed Asbestos Materials*

A number of materials which might contain asbestos were not sampled during our survey due to limitations in scope and methodology. Where present, these materials must be assumed to be an asbestos material and are best sampled during project planning and preparation of contract documents for their removal. Materials assumed to contain asbestos include:

- roofing, felts and tar
- concrete floor levelling compound
- elevator and lift brakes
- electrical components or wiring within control centers, breakers, motors or lights, insulation on wiring
- firestopping
- vermiculite in concrete block wall cavities
- adhesives and duct mastics
- caulking, sealants and putty
- mechanical packing, ropes and gaskets
- fire resistant doors

## 3.2 **Lead**

### 3.2.1 *Paints*

No lead samples were taken during 2016.

### 3.2.2 *Lead Products and Applications*

Lead-containing batteries may be present in emergency lighting throughout the building.

### 3.2.3 *Assumed Lead Materials*

Lead may be present in a number of materials which were not assessed and/or sampled. The following materials, where found, should be considered to contain lead.

- electrical components, including wiring connectors, fibre optic cable sheathing, grounding conductors, and solder

## 3.3 **Silica**

Crystalline silica is assumed component of the following building materials where present in the building:

- poured or pre-cast concrete
- masonry and mortar
- ceramic tiles, grout

### **3.4 Mercury**

#### *3.4.1 Lamps*

Mercury vapour is present in fluorescent lamps throughout the assessed area.

#### *3.4.2 Mercury-Containing Devices*

Mercury-containing devices were not found during the survey.

#### *3.4.3 Lighting Ballasts*

Based on the year of building construction (post 1980) and confirmed by visual observations (evidence of T-8 fixtures) the building has been comprehensively re-lamped and will not contain PCB ballasts.

#### *3.4.4 Transformers*

All transformers in the building are dry type transformers and do not contain PCB-containing dielectric fluids.

### **3.5 Mould**

Visible mould growth was not found in the assessed area.

## **4.0 RECOMMENDATIONS**

### **4.1 General**

Perform a detailed intrusive survey prior to building renovation or demolition operations. The survey should include; destructive testing (i.e. coring and/or removal of building finishes and components), and sampling of materials not previously tested (i.e. roofing materials, caulking, mastics).

### **4.2 On-going Management and Maintenance**

The following recommendations are made regarding on-going management and maintenance work involving the hazardous materials identified.

#### *4.2.1 Asbestos*

Perform an assessment of asbestos materials on an annual basis. The next assessment of ACM should be performed prior to December 2017 to remain in compliance.

Remove all asbestos-containing materials (ACM) prior to alteration or maintenance work or if ACM may be disturbed by the work. Follow appropriate asbestos precautions for the classification of work being performed.

Update the asbestos inventory report upon completion of any abatement and removal of asbestos-containing materials.

#### *4.2.2 Lead*

Disturbance of lead in paint and coatings (or other materials) during maintenance activities may result in over-exposure to lead dust or fumes. The need for work procedures, engineering controls and personal protective equipment will need to be assessed on a project-by-project basis and must comply with provincial standards or guidelines. Performing an exposure assessment during work that disturbs lead in paints and coatings may be able to alleviate the use of some of the precautions specified by these standards or guidelines.

Lead-containing items Lead-acid batteries should be recycled when taken out of service.

#### *4.2.3 Silica*

Disturbance of silica-containing products during maintenance activities may result in excessive exposures to airborne silica, especially if performed indoors and dry. Cutting, grinding, drilling or demolition of materials containing silica should be completed only with proper respiratory protection and other worker safety precautions that comply with provincial standards or guidelines.

#### *4.2.4 Mercury*

Recycle and reclaim mercury from fluorescent light tubes when taken out of service. Do not break lamps. Light tubes are accepted free of charge at many local recycling depots.

## **5.0 LIMITATIONS**

The work performed by Pinchin was conducted in accordance with the City of Toronto Contract Number 47018468, effective July 31, 2014.

## **6.0 REFERENCES**

The following legislation and documents were referenced in completing the survey and this report:

1. Asbestos on Construction Projects and in Buildings and Repair Operations, Ontario Regulation 278/05.
2. Designated Substances, Ontario Regulation 490/09.
3. Lead on Construction Projects, Ministry of Labour Guidance Document.

## 1.0 GENERAL

The following survey methodology is based on the requirements of the *Standard Operation Procedure for Designated Substance Surveys*, dated April, 2014, provided by the City of Toronto (the "SOP").

Pinchin conducted a room-by-room survey (rooms, corridors, service areas, exterior, etc.) to identify the hazardous building materials as defined in Section 1.1. Information regarding the approximate quantity, location, and condition of hazardous building materials encountered and visually estimated quantities were recorded on the *Survey Form*, provided by the City of Toronto, found in Appendix V. The locations of any samples collected were recorded on small-scale plans, found in Appendix I.

Drawings (i.e., floor plans), previous reports, and Survey Forms, were referenced where provided.

### 1.1 Limitations on Scope

The survey excludes the following:

- Owner or occupant articles (e.g. stored items, furniture, appliances, etc.);
- Underground materials or equipment (e.g. vessels, drums, underground storage tanks, pipes, etc.);
- Building envelope, structural components, inaccessible or concealed materials or other items where sampling may cause consequential damage to the property.
- Energized systems (e.g. internal boiler components, elevators, mechanical or electrical components);
- Controlled products (e.g. stored chemicals, operational or process-related substances); and
- Materials not typically associated with construction (e.g. settled dust, spills, residual contamination from prior spills, etc.).

The survey was limited to non-intrusive testing. Concealed spaces such as those above solid ceilings and within shafts and pipe chases were accessed via existing access panels only. Pinchin did not conduct demolition of walls, solid ceilings, structural items, interior finishes or exterior building finishes, to determine the presence of concealed materials.

### 1.2 Asbestos

Pinchin conducted an inspection for the presence of friable and non-friable asbestos-containing materials (ACM). A friable material is a material that when dry can be crumbled, pulverized or powdered by hand pressure.

Pinchin collected samples at a rate that is in compliance with Table 1 of O.Reg. 278/05. A separate set of samples was collected of each of homogenous material sampled. A homogenous material is defined by the US EPA<sup>1</sup> as material that is uniform in texture and appearance, was installed at one time, and is unlikely to consist of more than one type or formulation of material. The homogeneous materials are determined by visual examination, available information on the phases of the construction and prior renovations.

The following materials were sampled:

- All friable materials historically known to contain asbestos, regardless of year of installation, not identified in previous reports;
- Friable materials previously sampled in insufficient quantity to conclude the materials are non-asbestos, in accordance with the requirements of O.Reg. 278/05;
- Friable materials previously reported to contain less than 1% asbestos, if sampled prior to the Ministry of Labour defining an asbestos-containing material as a material containing contains 0.5 percent or more asbestos by weight;
- Non-friable acoustic ceiling tiles;
- Non-friable vinyl floor tiles and mastic.

The following materials were **not** sampled:

- Materials previously identified in previous reports provided as asbestos-containing;
- Materials previously confirmed to be non-asbestos in accordance with O.Reg. 278/05;
- Unless damaged the following materials were not sampled: plaster, drywall joint compound, mastic, window caulking, roofing materials, vinyl sheet flooring. Materials not sampled are assumed to contain asbestos.
- Materials where sampling poses an inherent, imminent danger to the Assessor such as high voltage wiring, materials present at heights greater than 12 feet, or those in confined spaces. These materials are assumed to be asbestos-containing.

In some cases, manufactured products such as asbestos cement pipe are visually identified without sample confirmation.

---

<sup>1</sup> Environmental Protection Agency

Pinchin submits the bulk samples to a NVLAP<sup>2</sup> accredited laboratory for analysis. The analysis is performed in accordance with Test Method EPA/600/R-93/116: Method for the Determination of Asbestos in Bulk Building Materials, July 1993.

The asbestos analysis is completed using a stop positive approach. Only one result of greater than the regulated criteria (0.5%) is required to determine that a material is asbestos-containing, but all samples must be analyzed to conclusively determine that a material is non-asbestos. The laboratory stops analyzing samples from a homogeneous material once a result greater than the regulated criteria is detected in any of the samples of that material. All samples of a homogeneous material are analyzed if no asbestos is detected. In some cases, all samples are analyzed in the sample set regardless of result. Where building materials are described in the report as non-asbestos, or described as containing no asbestos, this is subject to the limitations of the analytical method used, and should be understood to mean no asbestos was detected.

Asbestos materials are evaluated in order to make recommendations regarding remedial work. The priority for remedial action is based on several factors:

- friability (friable or non-friable).
- condition (good, fair, poor, debris, based on definitions in the SOP).
- accessibility (ranking from accessible to all building users to inaccessible).
- visibility (whether the material is obscured by other building components).
- efficiency of the work (for example, if damaged ACM is being removed in an area, it may be most practical to remove all ACM in the area even if it is in good condition).

This includes friability, condition and efficiency and practicality of the work.

### 1.3 Lead

Pinchin collected samples of damaged paint not identified in a previous report. Drawings included show sample locations.

Analysis for lead in paints or surface coatings is performed in accordance with EPA Method No. 3050B/Method No. 7420; flame atomic absorption at an accredited laboratory.

For this report, all paints containing lead at a concentration 0.1% or greater are discussed. Paint was evaluated for condition.

Lead building products (e.g. batteries, lead sheeting, flashing) are identified by visual observation only.

---

<sup>2</sup> National Voluntary Laboratory Accreditation Program

#### 1.4 Silica

Pinchin identifies building materials suspected of containing crystalline silica (e.g. concrete, cement, tile, brick, masonry, mortar) by knowledge of current and historic applications and visual inspection only.

Pinchin does not perform sampling of these materials for laboratory analysis of crystalline silica content.

#### 1.5 Mercury

Building materials/products/equipment (e.g. thermostats, barometers, pressure gauges, light tubes), suspected to contain mercury were identified by visual inspection only. Dismantling of equipment suspected of containing mercury was not performed. Sampling of these materials for laboratory analysis of mercury content was not performed.

Mercury spills or damaged mercury-containing equipment was recorded where observed.

#### 1.6 Polychlorinated Biphenyls

Pinchin determines the potential for light ballast and wet transformers to contain PCBs based on the age of the building, a review of maintenance records and examination of labels or nameplates on equipment, where present and accessible. The information is compared to known ban dates of PCBs and Environment Canada publications.

Dry type transformers are assumed to be free of dielectric fluids and hence non-PCB.

Pinchin records spills or leakage of suspect PCB-containing fluids where observed.

Fluids (mineral oil, hydraulic or Askaral) in transformers or other equipment are not sampled for PCB content.

Non-liquid forms of PCBs (i.e. sealants or caulking) are not sampled for PCB content.

#### 1.7 Visible Mould

Pinchin identifies the presence of mould if visibly present in a significant quantity on exposed building surfaces. If any mould growth is concealed within wall cavities it is not addressed in this survey.

## 1.0. EXECUTIVE SUMMARY

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work area(s) for David Duncan House-Restaurant building located at 125 Moatfield Drive, Toronto, Ontario, herein after referred to as the "Site".

The site inspection and sampling works were conducted on March 10, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

### **Asbestos**

Fisher was provided with the report of a previous DSS, which was conducted by ECOH Environmental Ltd. on July 8, 2014. This report indicates no identified assumed or confirmed ACM within the specified work area(s).

During the current survey, six (6) bulk samples of building materials found within the specified work area(s) and that could potentially contain asbestos, were collected and submitted to Fisher Environmental Laboratories for Polarised Light Microscopy (PLM) analysis, as outlined in NIOSH Method 9002.

The results of analysis revealed that each material sampled do not contain asbestos. Provide a copy of this report to contractors bidding on or performing work within the subject work areas.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

## **Lead**

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current survey, one (1) bulk sample of white paint found on handrail was collected and submitted to Fisher Environmental Laboratories for lead analysis. The results of analysis revealed that white paint contains <10 ppm of lead.

Fisher recommends that, prior to the planned renovation work, the removal of lead containing materials found within the specified work area(s), must be conducted using the appropriate lead abatement procedures. Lead abatement procedures to be used are determined by the method(s) of disturbance employed. Refer to *MOL Guideline: Lead on Construction Projects*, for details

## **Mercury**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey. Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

## **Silica**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings. If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to *MOL Guideline: Silica on Construction Projects* for details.

## **Other Designated Substances**

The other Designated Substances would not be expected to be present at the Site. No immediate actions were recommended with regard to acrylonitrile, arsenic, benzene, coke oven emissions, ethylene oxide, isocyanates, and vinyl chloride.

## **Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work area(s). No action is recommended with regard to mould.

## 2.0. INTRODUCTION

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work area(s) for David Duncan House-Restaurant building located at 125 Moatfield Drive, Toronto, Ontario, herein after referred to as the "Site".

The site inspection and sampling works were conducted on March 10, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

## 3.0. REGULATIONS

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

The OHSA, R.S.O. 1990, under the Ontario MOL, defines a toxic substance as a biological, chemical or physical agent (or a combination of such agents) whose presence in the workplace may endanger the health and safety of a worker. Sections of the Act that deals with toxic substances are intended to:

1. ensure that worker exposure to toxic substances is controlled;
2. ensure that toxic substances in the workplace are clearly identified and that workers are provided with enough information to be capable of handling them safely; and,
3. provide the general public with access to information about toxic substances used by industry in their communities.

The Act makes provision for a toxic substance to be "designated", where its use in the workplace is prohibited, regulated, restricted, limited or controlled. Designation is reserved for eleven substances that are particularly hazardous, covered under O. Reg 490/09 – *Designated Substances* that was implemented on July 1, 2010, and include Acrylonitrile, Arsenic, Asbestos, Benzene, Coke Oven Emissions, Ethylene Oxides, Isocyanates, Lead, Mercury, Silica, and Vinyl

Chloride. Formerly, regulations for these substances were passed separately and each outlined exposure limits where workers were likely to inhale, ingest and / or absorb the substance.

O. Reg. 490/09 provides a consistent approach to dealing with existing requirements and provisions, and outlines steps required to control worker exposure to these substances, including by inhalation, ingestion, skin absorption or skin contact. Each designated substance has an allowable level of exposure based on a time-weighted average (TWA) limit, and may also have a short-term exposure limit (STEL) and / or ceiling limit (C) assigned to it. TWA refers to the time-weighted average airborne concentration of a biological or chemical agent to which a worker may be exposed in a work day or work week, STEL refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed in any 15 minute period, and C refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed at any time. Refer to O. Reg. 490/09 – *Designated Substances*.

A supplementary regulation regarding control of asbestos exposures in the construction industry has evolved into O. Reg. 278/05 – *Asbestos on Construction Projects and in Buildings and Repair Operations*. The regulation includes a definition of asbestos-containing materials (ACM), requirements for additional training and clearance air testing, procedures for determining materials that meet the definition of ACM and for the use of glove bags, and provisions for varying from measure and procedures set out in the regulation.

In addition to the OHSA and regulations regarding designated substances, the following regulations, guidelines and standards were also taken into account or referenced:

- O. Reg. 213/91 - *Construction Projects* regulated under the OHSA and last amended by O. Reg. 443/09;
- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*;
- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes;
- MOL *Guideline: Lead on Construction Projects*, 2011; and,
- MOL *Guideline: Silica on Construction Projects*, 2011.

## 4.0. METHODOLOGY

Fisher followed the protocols outlined in O. Reg. 278/05 for collecting and analyzing bulk samples of materials suspected to contain asbestos. Visual assessment of the material was the primary method of identification with occasional physical contact for the purpose of collecting bulk samples or examining for underlying layers.

Where applicable, samples of suspect materials were collected in order to establish asbestos or lead content. Samples were grouped according to similarity of appearance (“homogeneous”

materials). The frequency at which the samples were collected was sufficient to obtain a general representation of the presence of these materials at the Site. Samples collected are presumed to be representative of respective building materials in-place at the Site. However, due to potential past renovations, alterations, repairs, or phases of construction, it is possible that individual materials may not be representative of samples collected.

Sampling of roofing materials was not part of the current scope of work. Further, sampling of materials found within operating equipment, portable building articles, or generally non-accessible components such as insulation within electrical switch gears, wiring, motors, light fixtures, elevator brakes, fire door cores, etc. was not performed as part of the current survey.

Samples collected during the survey were placed in plastic zip-lock bags which were labeled and submitted for laboratory analysis. Fisher Environmental Laboratories analysed bulk samples for asbestos type and approximate percent content by performing polarized light microscopy (PLM), as outlined in NIOSH Method 9002. Fisher Environmental Laboratories analysed samples for lead content in paint by performing acid digestion followed by Inductively Coupled Plasma (ICP) analysis.

Site Plan(s), indicating specific work area(s), and bulk sample locations, are included in Appendix A. The laboratory certificate(s) of analysis are included in Appendix B. Representative photos of Site conditions encountered at the time of the current survey are included in Appendix C.

## **5.0. REVIEW OF PREVIOUS REPORTS**

Fisher was provided with the report of a previous DSS, which was conducted by ECOH Environmental Ltd. on July 8, 2014, attached in Appendix D. This report indicates no identified assumed or confirmed ACM within the specified work area(s).

## **6.0. FINDINGS AND RECOMMENDATIONS**

### **6.1. *Acrylonitrile***

Acrylonitrile would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Acrylonitrile are warranted at this time.

### **6.2. *Arsenic***

Arsenic would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Arsenic are warranted at this time.

## **6.3. Asbestos**

### **6.3.1. General Information**

Asbestos is the name given to a group of six different fibrous minerals (amosite, chrysotile, crocidolite, and the fibrous varieties of tremolite, actinolite and anthophyllite) that occur naturally in the environment. Asbestos minerals have separable long fibres that are strong and flexible enough to be spun and woven and are heat resistant.

Because of these characteristics, asbestos has been used for a wide range of manufactured goods, mostly in building materials (roofing shingles, ceiling and floor tiles, paper products, and asbestos cement products), friction products (automobile clutch, brake, and transmission parts), heat-resistant fabrics, packaging, gaskets, and coatings. Some vermiculite or talc products may also contain asbestos.

Asbestos fibres may be released into the air by the disturbance of ACM during product use, renovation or demolition work, building or home maintenance, repair and remodeling. In general, exposure may occur only when the ACM is disturbed in some way to release particles and fibres into the air.

### **6.3.2. Friable vs. Non-Friable ACM**

Based on the requirements of O. Reg. 278/05 and due diligence, an asbestos survey and report must be available at any workplace where asbestos exists identifying locations and types of ACM in the building. The survey must include both friable and non-friable materials confirmed to contain asbestos, as well as any other materials which were not sampled but are suspected (presumed) ACM. The term friable refers to material(s) that could be readily reduced to dust or powder when crushed by hand or moderate pressure. Friable materials have a much greater chance of releasing airborne asbestos fibres when disturbed.

In the past, the most commonly used friable asbestos-containing building materials were surfacing materials (e.g. sprayed on fireproofing, texture, decorative or acoustic plaster) as well as thermal insulation. Examples of manufactured asbestos-containing materials include vinyl floor tiles, ceiling tiles, gasket materials, asbestos cement (transite) pipes or boards, and asbestos textiles. Depending on the above noted formulation, these materials range from non-friable to friable. Although some products are considered non-friable when in Good condition, severe damage or deterioration may cause non-friable materials to generate airborne dust more readily. Severely damaged non-friable materials, or those to be worked on with powered tools, may be considered as friable ACM for abatement purposes.

Examples of common types of ACM by friability include:

- Friable ACM

- Sprayed Materials (or materials installed by roller or trowel), such as fireproofing, thermal insulation, texture finishes, etc.
  - Mechanical Insulation such as boiler and breeching, ductwork, piping, tanks and associated equipment.
  - Plaster
- Potentially Friable ACM
  - Acoustic Ceiling Tiles
  - Vinyl Sheet Flooring
- Non-Friable ACM
  - Vinyl Floor Tiles
  - Asbestos cement (“transite”) piping or paneling
  - Window Caulking

### 6.3.3. Regulations

Exposure to asbestos is controlled by two Regulations passed under Ontario’s Occupational Health and Safety Act (OHSA), R.R.O. 1990.

- O. Reg. 490/09 – *Designated Substances* regarding asbestos applies to:
  - every employer operating a mine for the purpose of mining, crushing, grinding or sifting asbestos;
  - every employer processing, adapting or using asbestos in connection with manufacturing or assembling of goods or products;
  - every employer engaged in the repair, alteration or maintenance of machinery, equipment, aircraft, ships, locomotives, railway cars and vehicles;
  - every employer engaged in work on a building that is necessarily incidental to the repair, alteration or maintenance of machinery or equipment; and,
  - to those workers of such employers who are likely to be exposed to asbestos.

Exposure limits for this substance are set at 0.1 f/cc (TWA) for all types of asbestos.

- O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* applies to buildings that contain friable and non-friable ACM and to the repair, alteration and/or maintenance of these buildings.

In addition to regulations for controlling work around asbestos-containing building materials there are regulations for packaging, transportation and disposal of asbestos-containing waste:

- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*; and,

- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes.

#### **6.3.4. Findings**

Samples of homogenous materials suspected to contain asbestos were collected and submitted for analysis. Fisher collected six (6) bulk samples of building materials found within the specified work area(s) and that could potentially contain asbestos. Findings of all building materials identified within the specified work area(s) are outlined in further detail below.

##### **6.3.4.1. Sprayed or Troweled Fireproofing and Thermal Insulation**

No indication of sprayed or troweled fireproofing and / or thermal insulation was noted in any of the specified work area(s) during the current survey.

##### **6.3.4.2. Texture Finish**

No texture finish was noted in any of the specified work area(s) during the current survey.

##### **6.3.4.3. Mechanical Insulation**

No mechanical insulation was noted in any of the specified work area(s) during the current survey.

##### **6.3.4.4. Acoustic Ceiling Tile**

No acoustic ceiling tile was noted in any of the specified work area(s) during the current survey.

##### **6.3.4.5. Plaster / Drywall Joint Compound**

Plaster and drywall joint compound were observed within the specified work areas during the survey. The previous report indicated that both materials were sampled for analysis. The results of analysis revealed that both the plaster and drywall joint compound do not contain asbestos.

##### **6.3.4.6. Asbestos Cement Products**

No asbestos cement products, such as Transite pipe or board, were noted in any of the specified work area(s) during the current survey.

##### **6.3.4.7. Vinyl Sheet Flooring**

No vinyl sheet flooring was noted in any of the specified work area(s) during the current survey.

##### **6.3.4.8. Vinyl Floor Tile**

No vinyl floor tile was noted in any of the specified work area(s) during the current survey.

##### **6.3.4.9. Other ACM**

###### Cream Caulking

Cream caulking was observed between wall and handrail on the exterior of the house. Three (3) samples of the cream caulking were collected for analysis. The results of analysis revealed that the cream caulking does not contain asbestos.

### Mortar

Mortar was observed on the brick wall on the exterior. Three (3) samples of the mortar were collected for analysis. The results of analysis revealed that the mortar does not contain asbestos.

### **6.3.5. Recommendations**

No asbestos-containing materials were identified in any of the specified work area(s). Therefore, no recommendations with regards to ACM are warranted at this time.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

The presence of ACM should be presumed in locations not accessed during this survey. It is possible that ACM is present at the Site that is not identified in this report. Should additional suspected ACM be discovered, it should be presumed as ACM until sample analysis determines asbestos content.

Due to the limited nature of the current scope of work and the presence of solid building finishes (i.e. plaster or drywall walls and ceilings etc.) in many locations, the full extent of ACM may not be confirmed. Precautions should be taken when dismantling solid wall or ceiling finishes, or any other building surfaces which may conceal potential ACM. Such precautions include, but are not limited to, isolation measures and appropriate personal protective equipment.

### **6.4. Benzene**

Benzene would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Benzene are warranted at this time.

### **6.5. Coke Oven Emissions**

Coke oven emissions would not be expected to be present at the Site and were not observed during the current survey. No recommendations for coke oven emissions are warranted at this time.

### **6.6. Ethylene Oxides**

Ethylene oxides would not be expected to be present at the Site and were not observed during the current survey. No recommendations for ethylene oxides are warranted at this time.

### **6.7. Isocyanates**

Isocyanates would not be expected to be present at the Site and were not observed during the current survey. No recommendations for isocyanates are warranted at this time.

## **6.8. Lead**

### **6.8.1. General Information**

Lead is a naturally occurring bluish–gray metal found in small amounts in the earth’s crust. Most lead in the environment comes from human activities such as burning fossil fuels, mining and manufacturing. Lead is used in the production of batteries, ammunition, metal products (solder and pipes) and X-ray devices.

Lead does not break down but lead compounds are changed by sunlight, air and water. Exposure occurs when eating food or drinking water that contains lead. Deteriorated lead paint can contribute to lead dust. The main target for lead toxicity is the nervous system.

### **6.8.2. Regulations and Guidelines**

The Ontario MOL has not prescribed criteria defining an analyzed sample of bulk material as “lead-containing”. Further, the MOL has not established a lower limit for concentrations of lead in paint, below which precautions do not need to be considered during construction projects. However, except for very aggressive disturbance of painted finishes, (e.g., abrasive blasting, torch cutting, or grinding), Fisher believes that a lead content below 0.1% by weight (1,000 ug/g or 1000 ppm) represents a concentration in which the lead content is not the limiting hazard for construction hygiene purposes. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations.

The regulation for the designated substance lead applies to every employer and worker at a workplace where lead is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to lead. Exposure limits for this substance are set at 0.05 – 0.10 mg/m<sup>3</sup> (TWA) depending on the type of lead, and for tetraethyl lead 0.30 mg/m<sup>3</sup> (STEL).

Additionally, in 2011 the MOL revised *Guideline: Lead on Construction Projects* outlining practices that should be followed during construction projects to protect workers from exposure to lead. This includes the methods and equipment employed in the removal of lead-containing coatings that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **6.8.3. Findings**

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current survey, one (1) bulk sample of white paint found on handrail was collected and submitted to Fisher Environmental Laboratories for lead analysis. The results of analysis revealed that white paint contains <10 ppm of lead.

### 6.8.4. Recommendations

Where any lead-containing materials may be disturbed or removed, Fisher recommends that appropriate lead abatement procedures be used. The lead abatement procedures to be used are determined by the method(s) of disturbance employed. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations. The table below outlines lead abatement operations and associated respirator required, as outlined in Ontario MOL guidelines.

#### Classifications of Lead-Containing Operations and Required Respirator

<b>Type 1 Operations</b> (where concentrations of airborne lead would be expected to be < 0.05 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Removal of lead containing coatings with chemical gel or paste and fibrous laminated cloth wrap</li> <li>• Removal of lead containing coatings / materials using power tool that has an effective dust collection system equipped with HEPA filter</li> <li>• Removal of lead containing coatings / materials using non-powered hand tools other than manual scraping or sanding</li> </ul>	Respirators should not be necessary if general procedures are followed and level of air is less than 0.05 mg/m <sup>3</sup> . However, if worker wishes to use a respirator, a half-mask particulate respirator with N-, R- or P-series filter, and 95, 99 or 100% efficiency should be provided.
<b>Type 2a Operations</b> (where concentrations of airborne lead would be expected to be > 0.05 to 0.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Removal of lead containing coatings / materials by scraping or sanding using non-powered hand tools</li> <li>• Manual demolition of lead painted plaster walls / building components by striking with a sledgehammer or similar tool</li> </ul>	NIOSH APF = 10 Half-mask particulate respirator with N-, R- or P- series filter, and 95, 99 or 100% efficiency.
<b>Type 2b Operations</b> (where concentrations of airborne lead would be expected to be > 0.50 to 1.25 mg/m <sup>3</sup> )	
Not applicable to potential renovation activities.	
<b>Type 3a Operations</b> (where concentrations of airborne lead would be expected to be > 1.25 to 2.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Welding or high temperature cutting of lead-containing coatings or materials indoors or in a confined space.</li> <li>• Dry removal of lead-containing mortar using an electronic or pneumatic cutting device.</li> <li>• Burning of a surface containing lead</li> <li>• Removal of lead containing coatings / materials using power tools without an effective dust collection system equipped with HEPA filter</li> </ul>	NIOSH APF = 50 Full-face piece air-purifying respirator with N-, R- or P- series filter and 100% efficiency. Tight-fitting powered air-purifying respirator with high efficiency filter. Full-face piece supplied-air respirator operated in demand mode. Half-mask or full-face piece supplied air respirator operated in continuous-flow mode.
<b>Type 3b Operations</b> (where concentrations of airborne lead would be expected to be > 2.50 mg/m <sup>3</sup> )	
Abrasive blasting of lead-containing coatings or materials.	NIOSH APF >=1000 Type CE abrasive-blast supplied respirator operated in a positive pressure mode with a tight-fitting half-mask face piece.

Refer to MOL *Guideline: Lead on Construction Projects, 2011*, for details of the Ministry's health and safety guidelines regarding lead.

## **6.9. Mercury**

### **6.9.1. General Information**

Mercury is a naturally occurring metal. It is a shiny, silver-white and odourless liquid. It combines with other elements to form inorganic compounds or salts. Metallic mercury is used to produce chlorine gas and caustic soda, and is used in thermostats and thermometers, fluorescent light bulbs, dental fillings and batteries. Exposure occurs when eating fish or shellfish contaminated with methyl mercury, breathing vapors from spills, incinerators, etc.

The nervous system is very sensitive to all forms of mercury. Exposure to high levels of metallic inorganic or organic mercury can permanently damage the brain, kidneys and developing fetus. Short-term exposure may cause lung damage, nausea, vomiting and diarrhea as well as skin and eye irritation.

### **6.9.2. Regulations**

The regulation for mercury applies to every employer and worker at a workplace where mercury is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to mercury. Exposure limits for this substance are set at 0.025 – 0.01 mg/m<sup>3</sup> (TWA) for all forms of mercury excluding alkyl, and for alkyl compounds of mercury 0.03 mg/m<sup>3</sup> (STEL).

### **6.9.3. Findings**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey.

### **6.9.4. Recommendations**

Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

## **6.10. Silica**

### **6.10.1. General Information**

Silica is a crystalline compound occurring abundantly as quartz, sand, and many other minerals, and used to manufacture a variety of materials, especially glass and concrete. When mining this substance, silica can be deadly when it becomes airborne. If inhaled, silica dust can cause silicosis which can be fatal.

Some of the following industries have a high potential for risk to workers: construction (sandblasting, rock drilling, masonry work, jack hammering, tunneling), mining (cutting or drilling through sandstone or granite), foundry work (grinding, mouldings, shakeout, core room), stone cutting (sawing, abrasive blasting, chipping, grinding), manufacturing and use of abrasives, etc.

### **6.10.2. Regulations**

The regulation for silica applies to every employer and worker at a workplace where silica is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to silica. Exposure limits for this substance are set at 0.05 - 0.10 mg/m<sup>3</sup> (TWA), depending on the type of silica.

Additionally, in 2011 the MOL revised *Guideline: Silica on Construction Projects* outlining practices that should be followed during construction projects to protect workers from exposure to silica. This includes the methods and equipment employed in the removal of silica-containing materials that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **6.10.3. Findings**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings.

### **6.10.4. Recommendations**

If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to MOL *Guideline: Silica on Construction Projects* for details.

## **6.11. Vinyl Chloride**

Vinyl chloride would not be expected to be present at the Site and was not observed during the current survey. No recommendations for vinyl chloride are warranted at this time.

## **6.12. Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work area(s). No action is recommended with regard to mould.

## 7.0. LIMITATIONS

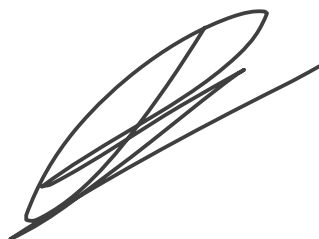

Fisher Environmental Ltd. accepts responsibility for the competent performance of its duties in executing this assignment within the normal standards of the profession, but disclaims responsibility for consequential damages, if any.

The scope of the survey is based on prior agreement with the client, and the rationale given in this report. The survey findings rely on professional interpretation of selective sampling and analysis. Sample analysis results have been applied to homogenous materials in unsampled locations; it was not within the scope of work to carry out an exhaustive sampling and analysis program. For non-accessible building spaces, the likelihood of the presence or absence of asbestos and other designated substances has been described, but such assessment is not a definitive statement of presence or absence.

This report was prepared for the IBI Group. The scope of services performed may not be appropriate for the purposes of other users, and any use or reuse of this document or its findings or recommendations represented herein is at the sole risk of any other user.

We trust that the information provided in the report meets your current requirements. If you have any questions or concerns, please do not hesitate to contact the undersigned.

Respectfully submitted,

Renata Stec, M.Sc.  
Project Manager

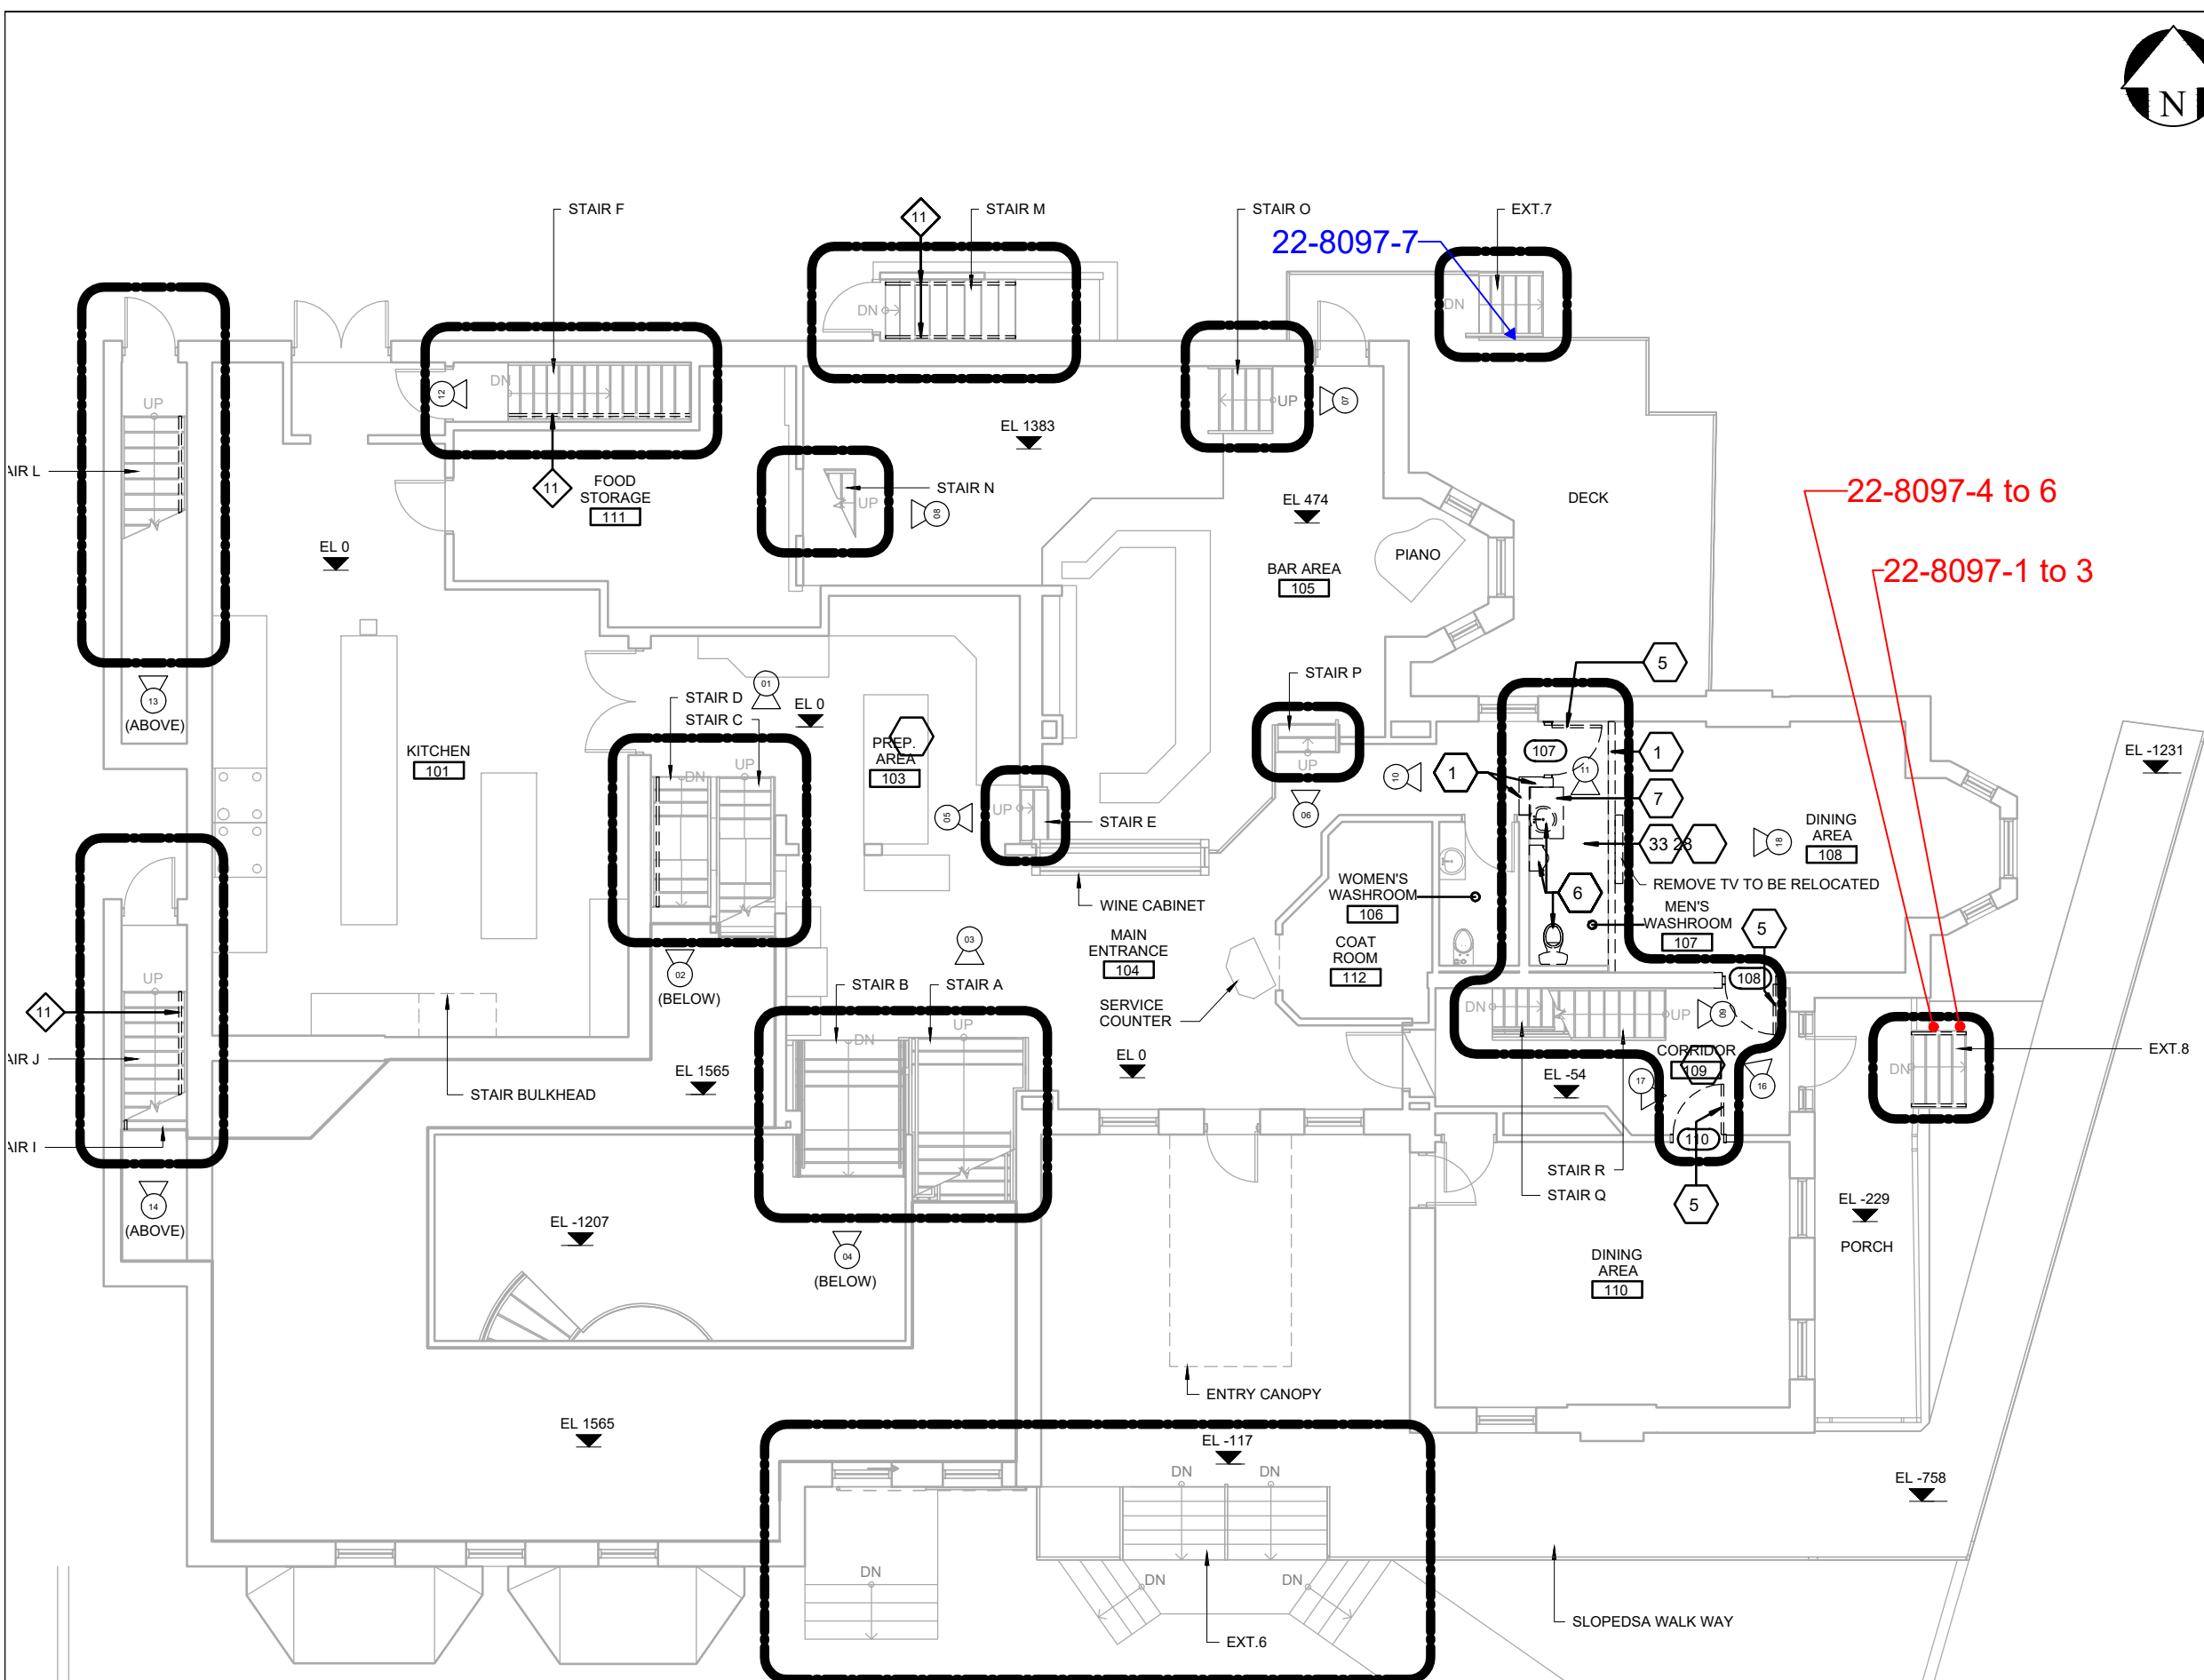

David Fisher, P. Eng., C. Chem.  
Principal

ECO H Inc.  
Project: 15170-B52

November 14, 2014

## EXECUTIVE SUMMARY

---

ECOH was retained by The City of Toronto to conduct a survey for designated substances and hazardous materials at the David Duncan House, located at 125 Moatfield Drive in Toronto, Ontario (hereafter referred to as the “facility” or the “project area”).

The objective of the survey was to determine the condition of previously identified asbestos-containing materials (ACM), identify and assess the condition of designated substances and other hazardous materials, and, if necessary, provide recommendations to assist the City of Toronto in fulfilling requirements to achieve regulatory compliance, as set forth under the Ontario Occupational Health and Safety Act, and enforced by the Ontario Ministry of Labour. This document should be filed as an addendum to the original survey report, which was issued by ECOH in October, 2005.

This designated substances survey report is for management purposes only. It is not intended to be used to establish the presence of designated substances or hazardous materials in building materials prior to demolition or renovation activities. **A pre-renovation/pre-demolition audit of the work area for designated substances and hazardous materials should be conducted prior to any work activities that may disturb building materials potentially containing designated materials or hazardous substances.**

Mr. Jack Liu of ECOH performed the fieldwork on July 8<sup>th</sup>, 2014.

### FINDINGS

The following presents a brief outline of ECOH’s findings within the facility. Refer to Appendix II for analytical results for asbestos. Refer to the main body of the report and Appendices I and IV for specific details, quantities and locations of Designated Substances and Hazardous Materials within the facility.

Material	Findings
Asbestos	Asbestos-containing materials (ACM) were identified in the facility as follows:  Assumed ACM were identified in the facility as follows: <ul style="list-style-type: none"><li>Window caulking and roofing materials throughout the facility. These materials were not sampled and should be assumed to be asbestos-containing, as per the project scope of work. All materials were observed to be in GOOD condition at the time of the survey.</li></ul>
Lead	No major sources of lead or lead-containing products were identified during the survey; however, lead may be present in: <ul style="list-style-type: none"><li>Wiring connectors and electric cable sheathing, and</li><li>Piping and solder joints/bell-and-spigot joints on piping.</li></ul>
Mould	Mould growth was not noted during the survey.
Mercury	Minor quantities are present as a vapour within fluorescent tubes lights and as a possible constituent of paints and adhesives.
Silica	Present in all concrete and masonry products.
Polychlorinated Biphenyls (PCBs)	Assumed to be present as a component of ballasts for fluorescent lights/ high-intensity discharge (HID) lights. Approximately 20 light fixtures are present within the facility.
Benzene	No potential sources of Benzene were identified.
Other Designated	Acrylonitrile, Arsenic, Coke Oven Emissions, Ethylene Oxide, Isocyanates, and

## EXECUTIVE SUMMARY

---

Substances and Hazardous Materials	Vinyl Chloride Monomer were not noted in significant quantities or forms, if at all.

### PCBs

PCB-containing light ballasts may legally remain in use until December 31, 2025, if they were already in use in the facility on September 5, 2008. However, it is ECOH's general recommendation that PCB ballasts are proactively removed to eliminate the possibility of ballasts rupturing and requiring costly remediation.

Disposal of fluorescent light ballasts that contain PCBs must follow Ontario Regulation 347, General – Waste Management, Ontario Regulation 362, Waste Management – PCB's, and the amended PCB Regulations, 2008 established under the Canadian Environmental Protection Act, 1999. Disposal of transformers must also follow these regulations, and a qualified contractor, experienced in PCB transformer removal, should be retained to complete this work.

Complete commentary on each of the designated substances in the project area can be found in the body of this report. The executive summary is not intended to substitute for the complete report, nor does it discuss certain specific issues documented in the report.

## 1. INTRODUCTION AND REGULATORY REQUIREMENTS

### 1.1 Introduction and Scope

ECOH was retained by The City of Toronto to conduct a survey for designated substances and hazardous materials at the David Duncan House, located at 125 Moatfield Drive in Toronto, Ontario (hereafter referred to as the “facility” or the “project area”).

The objective of the survey was to determine the condition of previously identified asbestos-containing materials (ACM), identify and assess the condition of designated substances and other hazardous materials, and, if necessary, provide recommendations to assist the City of Toronto in fulfilling requirements to achieve regulatory compliance, as set forth under the Ontario Occupational Health and Safety Act, and enforced by the Ontario Ministry of Labour. This document should be filed as an addendum to the original survey report, which was issued by ECOH in October, 2005.

This designated substances survey report is for management purposes only. It is not intended to be used to establish the presence of designated substances or hazardous materials in building materials prior to demolition or renovation activities. **A pre-renovation/pre-demolition audit of the work area for designated substances and hazardous materials should be conducted prior to any work activities that may disturb building materials potentially containing designated materials or hazardous substances.**

Mr. Jack Liu of ECOH performed the fieldwork on July 8<sup>th</sup>, 2014.

ECOH was unable to obtain access to Location B-12 (Kitchen Storage) in 2014, as keys were not available.

The survey included an investigation for the presence of designated substances, namely:

- |                        |                                 |
|------------------------|---------------------------------|
| → <i>Asbestos</i>      | → <i>Benzene</i>                |
| → <i>Lead</i>          | → <i>Coke Oven Emissions</i>    |
| → <i>Mercury</i>       | → <i>Ethylene Oxide</i>         |
| → <i>Silica</i>        | → <i>Isocyanates</i>            |
| → <i>Acrylonitrile</i> | → <i>Vinyl Chloride Monomer</i> |
| → <i>Arsenic</i>       |                                 |

And, in addition, investigation for:

- |                |   |
|----------------|---|
| → <i>Mould</i> | → <i>Polychlorinated Biphenyls (PCB)s</i> |
|----------------|---|

The following report details the project regulatory requirements, survey and analytical methodologies, findings and recommendations, and survey statement of limitations.

### 1.2 Regulatory Requirements

Regulatory requirements and guidelines applicable to the designated substances and hazardous materials noted above include, but are not limited to, the following:

- Ontario Occupational Health and Safety Act and applicable Regulations made under the Act including;
  - Designated Substances – Ontario Regulation 490/09, and

- Designated Substance – Asbestos on Construction Projects and in Buildings and Repair Operations – Ontario Regulation 278/05.
- Ontario Environmental Protection Act, and applicable regulations made under the Act.
  - General – Waste Management – Ontario Regulation 347
  - Waste Management – PCB's – Ontario Regulation 362.
- Canadian Environmental Protection Act, 1999 and applicable Regulations made under the Act, including:
  - PCB Regulations (SOR/2008-273), amended Dec 8, 2011.
  - Ministry of Labour Guideline, "*Lead on Construction Projects*", dated April 2011,
  - Ministry of Labour Guideline, "*Silica on Construction Projects*", dated April 2011.
  - Canadian Construction Association, Standard Construction Document CCA 82, 2004; "*Mould Guidelines for the Canadian Construction Industry*",
  - Environmental Abatement Council of Ontario (EACO) *Mould Abatement Guidelines*, Ed. 2, 2010.
  - Environment Canada Document, "*PCB Identification of Lamp Ballasts Containing PCBs*", EPS 2/CC/2, dated August 1991.
  - Environment Canada Document, "*Handbook on PCBs in Electrical Equipment*" EN 47-310/1988E, dated April 1988.

## 2. SURVEY METHODOLOGY

### 2.1 General Approach

To ensure familiarity with the building, and prior to commencing the survey, the surveyor made reference to previous surveys, facility floor plans, and other available documentation. The surveyor looked for the most common applications of building materials made with Designated Substances based on historical applications. The investigation performed was non-intrusive in nature (i.e. did not include demolition of building systems to verify concealed conditions).

### 2.2 Asbestos Survey Methodology

#### 2.2.1 Asbestos Sampling Strategy and Analytical Methods

Where sampling was required, bulk samples of potentially asbestos-containing materials were collected for analysis. As per the requirements of Ontario Regulation 278/05: multiple samples (ranging from 3 to 7 depending on quantity and type of material) are required to confirm that asbestos is not present in that given material. Only one positive result (i.e. confirming the presence of asbestos) is required to classify a material as asbestos-containing. Therefore, ECOH's sampling strategy involves the collection of sufficient numbers of samples to meet regulatory requirements, followed by instructions to the laboratory to cease analysis of all remaining samples within a series when a sample within that series is determined to be asbestos-containing.

Sampling requires a small volume of material to either be removed from a damaged section of suspect material or cut from intact material, which is then repaired by sealing with tape to prevent fibre release. The collected samples are placed in plastic bags, sealed, and shipped to an independent laboratory. A formal chain of custody procedure is maintained between ECOH and the sub-contracted laboratory during sample transport. Samples are analysed following the analytical procedure prescribed by the Regulation 278/05 U.S. Environmental Protection Agency Test Method EPA/600/R-93/116: Method for the Determination of Asbestos in Bulk Building Materials.

June 1993. Although not required by provincial regulation, all laboratories used by ECOH are accredited under the U.S. National Voluntary Laboratory Accreditation Program (NVLAP) to ensure consistent, accurate and defensible results.

Materials confirmed to be asbestos-containing during any previous assessments of the facility (if applicable) were not re-sampled for this survey. Additionally, samples were not collected of materials that were previously confirmed to be non-asbestos per the requirements of Ontario Regulation 278/05.

Non-friable, potentially asbestos-containing materials (including plaster, drywall joint compound, vinyl floor tiles, mastics, window caulking, etc.) were not sampled unless damaged or otherwise deemed necessary by the surveyor(s) or the City of Toronto. Unless sampled, non-friable potentially asbestos-containing materials were assumed to be asbestos-containing.

### 2.3 Lead Methodology

Where sampling was required (ie. where damaged materials were observed), bulk samples of potentially lead-containing materials were collected for analysis by flame atomic absorption spectrometry. The collected samples were placed in plastic bags, sealed, and shipped to an independent laboratory. A formal chain of custody procedure is maintained between ECOH and the sub-contracted laboratory during sample transport. All laboratories used by ECOH are accredited under the U.S. EPA National Environmental Lead Laboratory Accreditation Program (NLLAP) and/or American Industrial Hygiene Association (AIHA) Environmental Lead Laboratory Accreditation Program (ELLAP) to ensure consistent, accurate and defensible results.

Lead concentrations exceeding 1000ppm (0.1%) are considered to indicate the material is “lead-containing” per City of Toronto policy and applicable guidelines.

### 2.4 Mould Assessment

The mould assessment of the project area was conducted in accordance with the Canadian Construction Association, Standard Construction Document CCA 82, 2004; “*Mould Guidelines for the Canadian Construction Industry*”. Although there are no regulatory requirements or guidelines in Ontario for such an assessment, the preceding protocol has become accepted as the industry standard by most experts, consultants, and the Ontario Ministry of Labour.

### 2.5 Assessment for PCBs

The primary sources of PCBs in high concentrations in commercial facilities are ballasts in fluorescent or HID light fixtures, and electrical transformers.

Neither dismantling the lights to investigate the ballasts, nor dismantling the transformers to investigate their interiors, was part of the scope of this survey. A rough count of the number of fluorescent or HID light fixtures in the building was made, and is presented in the findings. Without disassembly, it is impossible to determine whether the ballasts are PCB-containing, and therefore all such light fixtures are assumed to contain PCB ballasts.

Electrical transformers cannot be safely disassembled during a survey such as this. Determination of PCB content relies on the comparison of information on labels and nameplates located on the exterior of the transformer with standard PCB Identifier Code literature. Transformers must be assumed to contain PCB's if the results of that comparison do not clearly and specifically indicate the transformer does not contain PCB's.

## **2.6 Hazardous Materials Survey Inventory**

ECOH's surveyor completed a mould, lead and asbestos field data sheet for each room entered. The data sheet contains the room name, a unique room number assigned by the surveyor, the quantity, type and condition of potentially hazardous materials present in the room, and sampling information. The inventory sheet is included as Appendix I.

## **2.7 Survey of Other Hazardous Materials**

Materials or equipment suspected of containing other Designated Substances and/or PCBs are identified by appearance, age and knowledge of historic applications.

# **3. FINDINGS AND RECOMMENDATIONS**

## **3.1 Asbestos**

At the request of the City of Toronto, samples of all assumed asbestos-containing materials (ACM) within the facility were collected and analysed for asbestos content.

Assumed ACM identified within the facility includes the following:

- Window Caulking (Non-friable), and
- Roofing Material (Non-friable).

All assumed and/or confirmed ACM were observed to be in GOOD condition at the time of the reassessment.

The analytical results for the sampled ACM can be found on Table 1, which is included as Appendix VI.

The locations and quantities of materials assumed or confirmed to be asbestos-containing can be found in the hazardous materials inventory sheet, which is included as Appendix I.

For the purposes of future renovation and/or demolition activities in specific locations within the facility, any building materials not specifically sampled in the project area should be treated as if their asbestos content is not known. Such materials should, therefore, be sampled prior the occurrence of renovation or demolition work.

Additional asbestos-containing materials may be present in areas of the building which were inaccessible at the time of the survey (ie. above fixed ceilings, behind walls, under flooring, etc.).

## **3.2 Lead**

No potentially lead-containing materials were observed to be damaged during the survey, and, therefore, no samples of such materials were collected.

No other significant potential sources of lead or lead-containing products were identified during the survey. However, lead may be present in:

- Wiring connectors and electric cable sheathing, and
- Piping and solder joints or bell joints on piping.

## **3.3 Mould**

No mould-affected building materials were observed during the survey.

### 3.4 Mercury

Mercury is present in minor quantities within the project area in the following forms:

- As a vapour within fluorescent light tubes that are present in the project area,
- As a possible constituent of thermostats, and
- As a possible constituent of paints and adhesives.

Items suspected to contain mercury were noted to be in good condition.

### 3.5 Silica

Free crystalline silica, in the form of common construction sand, is present in all concrete and masonry products within the building.

### 3.6 Polychlorinated Biphenyls (PCBs)

The following potential sources of Polychlorinated Biphenyls (PCBs) were identified within the facility. Dismantling lights to investigate ballasts and/or dismantling transformers to investigate their contents, was not part of the scope of this survey. Therefore, the items listed below must be assumed to contain PCBs, unless specifically stated otherwise:

- Fluorescent light ballasts:
  - Approximately 20 fluorescent light fixtures are present throughout the facility. Ballasts within these fixtures are assumed to contain PCBs.

Additional mechanical equipment or components of mechanical equipment throughout the facility may contain PCBs. These may include, but are not limited to, electrical capacitors and electrical equipment containing capacitors, voltage regulators, switches, re-closers, bushings or electromagnets, cable insulation, heat transfer equipment, hydraulic equipment, vapour diffusion pumps, bridge bearings, and caulking and motor/hydraulic oils. A specific assessment prior to the removal of any mechanical equipment within the facility should be conducted to confirm if PCBs are present within the equipment.

### 3.7 Other Environmental Considerations

The environmental audit also included an investigation for the following compounds, none of which were found to be present:

- |                       |                          |
|-----------------------|--------------------------|
| • Acrylonitrile       | • Ethylene Oxides        |
| • Arsenic             | • Isocyanates            |
| • Coke Oven Emissions | • Vinyl Chloride Monomer |
| • Benzene             |                          |

Please note: paint, adhesives and plastics present throughout the project area may contain trace amounts of Acrylonitrile, Arsenic, Benzene, Ethylene Oxides, Isocyanates, Lead, Mercury and Vinyl Chloride Monomer. However, none of these materials were observed in a hazardous or unsafe condition.

## 4. RECOMMENDATIONS

### 4.1 Asbestos

All assumed and/or confirmed ACM were observed to be in GOOD condition at the time of the reassessment. As such, no corrective actions are recommended at this time.

**NOTE:** Interpretation of all sources of asbestos-related information, including but not limited to the original asbestos survey report, asbestos reassessment reports, room-by-room survey data, survey drawings and reports from previous asbestos abatement projects, should be completed by a competent person trained in the historical application of asbestos in building materials, building design and preferably by a person with site-specific knowledge and/or experience.

Information contained within any of the above-noted sources may not relieve the Regulatory responsibility of building Owners, or project Employers/Constructors, to complete a detailed site inspection prior to commencement of a project.

This report should not be used as a substitute for a detailed site inspection to identify asbestos-containing building materials, which must be specifically tailored to the scope and nature of any given project, and completed prior to any maintenance, renovation or demolition work that may cause disturbance to building materials.

#### 4.2 Lead

Renovation, demolition or general construction work involving the removal of materials containing only trace concentrations of lead (ie. Concentrations below 0.1% (1000ppm) by dry weight) can be completed without lead specific safety precautions provided that:

- a) work does not include 'fume generating activities' (heat producing) such as welding, torching, burning, high temperature cutting, etc.,
- b) work does not include dust-generating activities such as grinding, cutting or chemical stripping,
- c) dust levels are maintained below  $3\text{mg}/\text{m}^3$ , and
- d) general health and safety construction procedures are implemented, which would include dust suppression methods, proper respiratory protection (minimum of a 1/2-face respirator) and protective clothing, as is appropriate for the work being completed.

Any work involving the disturbance of building materials assumed to contain lead (e.g. wiring connectors or electric cable sheathing) should be conducted following recommendations detailed within the Ministry of Labour document *Guideline - Lead on Construction Projects*, dated April 2011.

All lead-containing waste materials must be disposed of following requirements set forth in applicable federal and/or provincial regulations, including Ontario Regulation 347: *General – Waste Management*.

#### 4.3 Mercury

The presence of mercury within assembled units (e.g. fluorescent light bulbs and thermostat bulbs) should not be considered a hazard provided that the assembled units remain sealed and intact. Avoid direct skin contact with mercury and avoid inhalation of mercury vapour. If required, dispose of mercury following applicable legislative requirements.

#### 4.4 Silica

Silica-containing building materials are present throughout the facility (e.g. concrete, brick, cement block, etc.). Any work involving the disturbance of materials that may contain silica should be

conducted following recommendations detailed in the Ministry of Labour document “*Guideline - Silica on Construction Projects*”, dated September 2004.

#### **4.5 Polychlorinated Biphenyls (PCBs)**

Fluorescent light ballasts throughout the facility are assumed to contain PCBs, as neither dismantling the lights to investigate the ballasts, nor dismantling the transformers to investigate their contents, was part of the scope of this survey.

PCB-containing light ballasts may legally remain in use until December 31, 2025, if they were already in use in the facility on September 5, 2008. However, it is ECOH’s general recommendation that PCB ballasts are proactively removed to eliminate the possibility of ballasts rupturing and requiring costly remediation. To determine whether light ballasts contain PCBs, they should be disassembled to observe serial codes and then compared to standard PCB Identifier Code literature. Ballasts with unidentifiable serial codes, or from manufacturers who are not included in the standard PCB Identifier Code literature, or which are not clearly labelled as “PCB Free”, or for which no date is clearly visible (ballasts dated 1981 or later do not contain PCBs), must be assumed to contain PCBs.

Disposal of fluorescent light ballasts that contain PCBs must follow Ontario Regulation 347, General –Waste Management, Ontario Regulation 362, Waste Management – PCB’s, and the amended PCB Regulations, 2008 established under the Canadian Environmental Protection Act, 1999.

Removal of any other PCB-containing substances or equipment in the facility should follow the amended *PCB Regulations*, 2008, made under the *Canadian Environmental Protection Act, 1999* (CEPA).

#### **4.6 Other Substances**

Dust suppression and personal protection procedures should be implemented during the demolition of materials that may contain Acrylonitrile, Arsenic, Benzene, Ethylene Oxides, Isocyanates, and Vinyl Chloride.

### **5. CORRECTIVE ACTIONS**

Corrective actions were not conducted.

### **6. STATEMENT OF LIMITATIONS**

Due to the nature of building construction, some limitations exist as to the possible thoroughness of the designated substance and hazardous materials survey. The field observations, measurements and analysis are considered sufficient in detail and scope to form a reasonable basis for the findings and conclusions presented in this report. The findings and conclusions drawn by ECOH Inc. (ECOH), concerning the designated substance and hazardous materials survey, are limited to the specific scope of work for which ECOH was retained and are based solely on information generated as a result of the specific scope of work authorized by The City of Toronto. The results of the designated substance and hazardous materials survey are limited to visual inspection of areas made accessible to ECOH personnel and information obtained from facility personnel, when obtained.

ECOH warrants that the findings and conclusions contained herein have been made in accordance with generally accepted evaluation methods in the industry and applicable regulations at the time of the performance of the designated substance survey. However, there is no warranty, expressed or

implied, that this building survey has uncovered all environmental considerations on the subject site. In addition, ECOH cannot guarantee the completeness or accuracy of information supplied by a third party.

This report was prepared by ECOH for The City of Toronto. The material in it reflects ECOH's professional interpretation of information available at the time of report preparation. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties.

## **APPENDIX II**

### **RESULTS OF BULK SAMPLE ANALYSES**

# Bulk Asbestos Analysis

By Polarized Light Microscopy  
EPA Method: 600/R-93/116 and 600/M4-82-020

NVLAP Lab Code: 200664-0

**Customer:** ECOH Management Inc  
6130 Tomken Rd  
Mississauga Ontario L5T 1X7

**Attn:** Jack Liu  
Steve Bizi  
Craig Maunder

**Lab Order ID:** 1414683

**Analysis ID:** 1414683\_PLM

**Date Received:** 7/31/2014

**Date Reported:** 8/6/2014

**Project:** 15170-B052-125 Moatfield Jolly Miller  
David Duncan House-Restaurant

Sample ID	Description	Asbestos	Fibrous Components	Non-Fibrous Components	Attributes
Lab Sample ID	Lab Notes				Treatment
15170-B52-01A	Drywall Joint Compound - Wall	None Detected		100% Other	White Non Fibrous Homogeneous
1414683PLM_1					Crushed
15170-B52-01B	Drywall Joint Compound - Wall	None Detected		100% Other	White Non Fibrous Homogeneous
1414683PLM_2					Crushed
15170-B52-01C	Drywall Joint Compound - Wall	None Detected		100% Other	White Non Fibrous Homogeneous
1414683PLM_3					Crushed
15170-B52-02A	Drywall Joint Compound - Wall	None Detected		100% Other	White Non Fibrous Homogeneous
1414683PLM_4					Crushed
15170-B52-02B	Drywall Joint Compound - Wall	None Detected		100% Other	White Non Fibrous Homogeneous
1414683PLM_5					Crushed
15170-B52-02C	Drywall Joint Compound - Wall	None Detected		100% Other	White Non Fibrous Homogeneous
1414683PLM_6					Crushed
15170-B52-02D	Drywall Joint Compound - Ceiling	None Detected		100% Other	White Non Fibrous Homogeneous
1414683PLM_7					Crushed
15170-B52-02E	Drywall Joint Compound - Ceiling	None Detected		100% Other	White Non Fibrous Homogeneous
1414683PLM_8					Crushed

**Disclaimer:** Due to the nature of the EPA 600 method, asbestos may not be detected in samples containing low levels of asbestos. We strongly recommend that analysis of floor tiles, vermiculite, and/or heterogeneous soil samples be conducted by TEM for confirmation of "None Detected" by PLM. This report relates only to the samples tested and may not be reproduced, except in full, without the written approval of SAI. This report may not be used by the client to claim product endorsement by NVLAP or any other agency of the U.S. government. Estimated MDL is 0.1%.

## 1.0. EXECUTIVE SUMMARY

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work area(s) for Fire Hall 123 building located at 143 Bond Avenue, Toronto, Ontario, herein after referred to as the "Site". The site inspection and sampling works were conducted on March 15, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

### **Asbestos**

Fisher was provided with the report of a previous DSS, which was conducted by Fisher Environmental Ltd. on June 10, 2016. This report has indicated the only assumed ACM within the specified work area(s) was drywall joint compound.

During the current survey, six (6) bulk samples of building materials found within the specified work area(s) and that could potentially contain asbestos, were collected and submitted to Fisher Environmental Laboratories for Polarised Light Microscopy (PLM) analysis, as outlined in NIOSH Method 9002.

The results of analysis revealed that each material sampled does not contain asbestos. Provide a copy of this report to contractors bidding on or performing work within the subject work areas.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

### **Lead**

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current investigation, no samples were collected for lead analysis.

Fisher recommends that, prior to the planned renovation work, the removal of lead containing materials found within the specified work area(s), must be conducted using the appropriate lead abatement procedures. Lead abatement procedures to be used are determined by the method(s) of disturbance employed. Refer to *MOL Guideline: Lead on Construction Projects*, for details

### **Mercury**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey. Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

### **Silica**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings. If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to *MOL Guideline: Silica on Construction Projects* for details.

### **Other Designated Substances**

The other Designated Substances would not be expected to be present at the Site. No immediate actions were recommended with regard to acrylonitrile, arsenic, benzene, coke oven emissions, ethylene oxide, isocyanates, and vinyl chloride.

### **Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work area(s). No action is recommended with regard to mould.

## 2.0. INTRODUCTION

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work area(s) for Fire Hall #123 building located at 143 Bond Avenue, Toronto, Ontario, herein after referred to as the "Site". The site inspection and sampling works were conducted on March 15, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

## 3.0. REGULATIONS

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

The OHSA, R.S.O. 1990, under the Ontario MOL, defines a toxic substance as a biological, chemical or physical agent (or a combination of such agents) whose presence in the workplace may endanger the health and safety of a worker. Sections of the Act that deals with toxic substances are intended to:

1. ensure that worker exposure to toxic substances is controlled;
2. ensure that toxic substances in the workplace are clearly identified and that workers are provided with enough information to be capable of handling them safely; and,
3. provide the general public with access to information about toxic substances used by industry in their communities.

The Act makes provision for a toxic substance to be "designated", where its use in the workplace is prohibited, regulated, restricted, limited or controlled. Designation is reserved for eleven substances that are particularly hazardous, covered under O. Reg 490/09 – *Designated Substances* that was implemented on July 1, 2010, and include Acrylonitrile, Arsenic, Asbestos, Benzene, Coke Oven Emissions, Ethylene Oxides, Isocyanates, Lead, Mercury, Silica, and Vinyl Chloride. Formerly, regulations for these substances were passed separately and each outlined exposure limits where workers were likely to inhale, ingest and / or absorb the substance.

O. Reg. 490/09 provides a consistent approach to dealing with existing requirements and provisions, and outlines steps required to control worker exposure to these substances, including by inhalation, ingestion, skin absorption or skin contact. Each designated substance has an allowable level of exposure based on a time-weighted average (TWA) limit, and may also have a short-term exposure limit (STEL) and / or ceiling limit (C) assigned to it. TWA refers to the time-weighted average airborne concentration of a biological or chemical agent to which a worker may be exposed in a work day or work week, STEL refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed in any 15 minute period, and C refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed at any time. Refer to O. Reg. 490/09 – *Designated Substances*.

A supplementary regulation regarding control of asbestos exposures in the construction industry has evolved into O. Reg. 278/05 – *Asbestos on Construction Projects and in Buildings and Repair Operations*. The regulation includes a definition of asbestos-containing materials (ACM), requirements for additional training and clearance air testing, procedures for determining materials that meet the definition of ACM and for the use of glove bags, and provisions for varying from measure and procedures set out in the regulation.

In addition to the OHSA and regulations regarding designated substances, the following regulations, guidelines and standards were also taken into account or referenced:

- O. Reg. 213/91 - *Construction Projects* regulated under the OHSA and last amended by O. Reg. 443/09;
- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*;
- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes;
- MOL *Guideline: Lead on Construction Projects*, 2011; and,
- MOL *Guideline: Silica on Construction Projects*, 2011.

## 4.0. METHODOLOGY

Fisher followed the protocols outlined in O. Reg. 278/05 for collecting and analyzing bulk samples of materials suspected to contain asbestos. Visual assessment of the material was the primary method of identification with occasional physical contact for the purpose of collecting bulk samples or examining for underlying layers.

Where applicable, samples of suspect materials were collected in order to establish asbestos or lead content. Samples were grouped according to similarity of appearance (“homogeneous” materials). The frequency at which the samples were collected was sufficient to obtain a general representation of the presence of these materials at the Site. Samples collected are presumed to

be representative of respective building materials in-place at the Site. However, due to potential past renovations, alterations, repairs, or phases of construction, it is possible that individual materials may not be representative of samples collected.

Sampling of roofing materials was not part of the current scope of work. Further, sampling of materials found within operating equipment, portable building articles, or generally non-accessible components such as insulation within electrical switch gears, wiring, motors, light fixtures, elevator brakes, fire door cores, etc. was not performed as part of the current survey.

Samples collected during the survey were placed in plastic zip-lock bags which were labeled and submitted for laboratory analysis. Fisher Environmental Laboratories analysed bulk samples for asbestos type and approximate percent content by performing polarized light microscopy (PLM), as outlined in NIOSH Method 9002. Fisher Environmental Laboratories analysed samples for lead content in paint by performing acid digestion followed by Inductively Coupled Plasma (ICP) analysis.

Site Plan(s), indicating specific work area(s), and bulk sample locations, are included in Appendix A. The laboratory certificate(s) of analysis are included in Appendix B.

## **5.0. REVIEW OF PREVIOUS REPORTS**

Fisher was provided with the report of a previous DSS, which was conducted by Fisher Environmental Ltd. on June 10, 2016, attached in Appendix C. This report has indicated the only assumed ACM within the specified work area(s) was drywall joint compound.

## **6.0. FINDINGS AND RECOMMENDATIONS**

### **6.1. *Acrylonitrile***

Acrylonitrile would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Acrylonitrile are warranted at this time.

### **6.2. *Arsenic***

Arsenic would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Arsenic are warranted at this time.

### **6.3. *Asbestos***

#### **6.3.1. General Information**

Asbestos is the name given to a group of six different fibrous minerals (amosite, chrysotile, crocidolite, and the fibrous varieties of tremolite, actinolite and anthophyllite) that occur naturally in the environment. Asbestos minerals have separable long fibres that are strong and flexible enough to be spun and woven and are heat resistant.

Because of these characteristics, asbestos has been used for a wide range of manufactured goods, mostly in building materials (roofing shingles, ceiling and floor tiles, paper products, and asbestos cement products), friction products (automobile clutch, brake, and transmission parts), heat-resistant fabrics, packaging, gaskets, and coatings. Some vermiculite or talc products may also contain asbestos.

Asbestos fibres may be released into the air by the disturbance of ACM during product use, renovation or demolition work, building or home maintenance, repair and remodeling. In general, exposure may occur only when the ACM is disturbed in some way to release particles and fibres into the air.

### **6.3.2. Friable vs. Non-Friable ACM**

Based on the requirements of O. Reg. 278/05 and due diligence, an asbestos survey and report must be available at any workplace where asbestos exists identifying locations and types of ACM in the building. The survey must include both friable and non-friable materials confirmed to contain asbestos, as well as any other materials which were not sampled but are suspected (presumed) ACM. The term friable refers to material(s) that could be readily reduced to dust or powder when crushed by hand or moderate pressure. Friable materials have a much greater chance of releasing airborne asbestos fibres when disturbed.

In the past, the most commonly used friable asbestos-containing building materials were surfacing materials (e.g. sprayed on fireproofing, texture, decorative or acoustic plaster) as well as thermal insulation. Examples of manufactured asbestos-containing materials include vinyl floor tiles, ceiling tiles, gasket materials, asbestos cement (transite) pipes or boards, and asbestos textiles. Depending on the above noted formulation, these materials range from non-friable to friable. Although some products are considered non-friable when in Good condition, severe damage or deterioration may cause non-friable materials to generate airborne dust more readily. Severely damaged non-friable materials, or those to be worked on with powered tools, may be considered as friable ACM for abatement purposes.

Examples of common types of ACM by friability include:

- Friable ACM
  - Sprayed Materials (or materials installed by roller or trowel), such as fireproofing, thermal insulation, texture finishes, etc.
  - Mechanical Insulation such as boiler and breeching, ductwork, piping, tanks and associated equipment.
  - Plaster
- Potentially Friable ACM
  - Acoustic Ceiling Tiles

- Vinyl Sheet Flooring
- Non-Friable ACM
  - Vinyl Floor Tiles
  - Asbestos cement (“transite”) piping or paneling
  - Window Caulking

### 6.3.3. Regulations

Exposure to asbestos is controlled by two Regulations passed under Ontario’s Occupational Health and Safety Act (OHSA), R.R.O. 1990.

- O. Reg. 490/09 – *Designated Substances* regarding asbestos applies to:
  - every employer operating a mine for the purpose of mining, crushing, grinding or sifting asbestos;
  - every employer processing, adapting or using asbestos in connection with manufacturing or assembling of goods or products;
  - every employer engaged in the repair, alteration or maintenance of machinery, equipment, aircraft, ships, locomotives, railway cars and vehicles;
  - every employer engaged in work on a building that is necessarily incidental to the repair, alteration or maintenance of machinery or equipment; and,
  - to those workers of such employers who are likely to be exposed to asbestos.

Exposure limits for this substance are set at 0.1 f/cc (TWA) for all types of asbestos.

- O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* applies to buildings that contain friable and non-friable ACM and to the repair, alteration and/or maintenance of these buildings.

In addition to regulations for controlling work around asbestos-containing building materials there are regulations for packaging, transportation and disposal of asbestos-containing waste:

- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*; and,
- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes.

### 6.3.4. Findings

Samples of homogenous materials suspected to contain asbestos were collected and submitted for analysis. Fisher collected six (6) bulk samples of building materials found within the specified work area(s) and that could potentially contain asbestos. Findings of all building materials identified within the specified work area(s) are outlined in further detail below.

**6.3.4.1. Sprayed or Troweled Fireproofing and Thermal Insulation**

No indication of sprayed or troweled fireproofing and / or thermal insulation was noted in any of the specified work area(s) during the current survey.

**6.3.4.2. Texture Finish**

No texture finish was noted in any of the specified work area(s) during the current survey.

**6.3.4.3. Mechanical Insulation**

The majority of mechanical insulation observed throughout the building are either not insulated or are insulated with fibreglass which is not suspected to contain asbestos.

**6.3.4.4. Acoustic Ceiling Tile**

No ceiling tiles were noted in any of the specified work area(s) during the current survey.

**6.3.4.5. Plaster / Drywall Joint Compound**

Plaster was not observed within the specified work areas during the survey. Drywall Joint Compound (DJC) was observed in the Apparatus Bay. During the current survey, three (3) samples of DJC were collected and submitted for analysis. The results of analysis revealed that the DJC does not contain asbestos.

**6.3.4.6. Asbestos Cement Products**

No asbestos cement products, such as Transite pipe or board, were noted in any of the specified work area(s) during the current survey.

**6.3.4.7. Vinyl Sheet Flooring**

No vinyl sheet flooring was noted in any of the specified work area(s) during the current survey.

**6.3.4.8. Vinyl Floor Tile**

During the current survey, one (1) variety of vinyl floor tile was observed within the specified work area(s).

- Vinyl Floor Tile 1 – 12" x 12", Beige Mosaic.

Vinyl Floor Tile 1 is not expected to be disturbed based on the scope of work required.

**6.3.4.9. Other ACM****Mortar**

Mortar was observed on the brick wall in the Vestibule. Three (3) samples of the mortar were collected for analysis. The results of analysis revealed that the mortar does not contain asbestos.

### **6.3.5. Recommendations**

No asbestos-containing materials were identified in any of the specified work area(s). Therefore, no recommendations with regards to ACM are warranted at this time.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

The presence of ACM should be presumed in locations not accessed during this survey. It is possible that ACM is present at the Site that is not identified in this report. Should additional suspected ACM be discovered, it should be presumed as ACM until sample analysis determines asbestos content.

Due to the limited nature of the current scope of work and the presence of solid building finishes (i.e. plaster or drywall walls and ceilings etc.) in many locations, the full extent of ACM may not be confirmed. Precautions should be taken when dismantling solid wall or ceiling finishes, or any other building surfaces which may conceal potential ACM. Such precautions include, but are not limited to, isolation measures and appropriate personal protective equipment.

### **6.4. Benzene**

Benzene would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Benzene are warranted at this time.

### **6.5. Coke Oven Emissions**

Coke oven emissions would not be expected to be present at the Site and were not observed during the current survey. No recommendations for coke oven emissions are warranted at this time.

### **6.6. Ethylene Oxides**

Ethylene oxides would not be expected to be present at the Site and were not observed during the current survey. No recommendations for ethylene oxides are warranted at this time.

### **6.7. Isocyanates**

Isocyanates would not be expected to be present at the Site and were not observed during the current survey. No recommendations for isocyanates are warranted at this time.

## **6.8. Lead**

### **6.8.1. General Information**

Lead is a naturally occurring bluish-gray metal found in small amounts in the earth's crust. Most lead in the environment comes from human activities such as burning fossil fuels, mining and manufacturing. Lead is used in the production of batteries, ammunition, metal products (solder and pipes) and X-ray devices.

Lead does not break down but lead compounds are changed by sunlight, air and water. Exposure occurs when eating food or drinking water that contains lead. Deteriorated lead paint can contribute to lead dust. The main target for lead toxicity is the nervous system.

### **6.8.2. Regulations and Guidelines**

The Ontario MOL has not prescribed criteria defining an analyzed sample of bulk material as "lead-containing". Further, the MOL has not established a lower limit for concentrations of lead in paint, below which precautions do not need to be considered during construction projects. However, except for very aggressive disturbance of painted finishes, (e.g., abrasive blasting, torch cutting, or grinding), Fisher believes that a lead content below 0.1% by weight (1,000 ug/g or 1000 ppm) represents a concentration in which the lead content is not the limiting hazard for construction hygiene purposes. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations.

The regulation for the designated substance lead applies to every employer and worker at a workplace where lead is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to lead. Exposure limits for this substance are set at 0.05 – 0.10 mg/m<sup>3</sup> (TWA) depending on the type of lead, and for tetraethyl lead 0.30 mg/m<sup>3</sup> (STEL).

Additionally, in 2011 the MOL revised *Guideline: Lead on Construction Projects* outlining practices that should be followed during construction projects to protect workers from exposure to lead. This includes the methods and equipment employed in the removal of lead-containing coatings that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **6.8.3. Findings**

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current investigation, no samples were collected for lead analysis.

### 6.8.4. Recommendations

Where any lead-containing materials may be disturbed or removed, Fisher recommends that appropriate lead abatement procedures be used. The lead abatement procedures to be used are determined by the method(s) of disturbance employed. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations. The table below outlines lead abatement operations and associated respirator required, as outlined in Ontario MOL guidelines.

#### Classifications of Lead-Containing Operations and Required Respirator

<b>Type 1 Operations</b> (where concentrations of airborne lead would be expected to be < 0.05 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Removal of lead containing coatings with chemical gel or paste and fibrous laminated cloth wrap</li> <li>• Removal of lead containing coatings / materials using power tool that has an effective dust collection system equipped with HEPA filter</li> <li>• Removal of lead containing coatings / materials using non-powered hand tools other than manual scraping or sanding</li> </ul>	Respirators should not be necessary if general procedures are followed and level of air is less than 0.05 mg/m <sup>3</sup> . However, if worker wishes to use a respirator, a half-mask particulate respirator with N-, R- or P-series filter, and 95, 99 or 100% efficiency should be provided.
<b>Type 2a Operations</b> (where concentrations of airborne lead would be expected to be > 0.05 to 0.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Removal of lead containing coatings / materials by scraping or sanding using non-powered hand tools</li> <li>• Manual demolition of lead painted plaster walls / building components by striking with a sledgehammer or similar tool</li> </ul>	NIOSH APF = 10 Half-mask particulate respirator with N-, R- or P- series filter, and 95, 99 or 100% efficiency.
<b>Type 2b Operations</b> (where concentrations of airborne lead would be expected to be > 0.50 to 1.25 mg/m <sup>3</sup> )	
Not applicable to potential renovation activities.	
<b>Type 3a Operations</b> (where concentrations of airborne lead would be expected to be > 1.25 to 2.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Welding or high temperature cutting of lead-containing coatings or materials indoors or in a confined space.</li> <li>• Dry removal of lead-containing mortar using an electronic or pneumatic cutting device.</li> <li>• Burning of a surface containing lead</li> <li>• Removal of lead containing coatings / materials using power tools without an effective dust collection system equipped with HEPA filter</li> </ul>	NIOSH APF = 50 Full-face piece air-purifying respirator with N-, R- or P- series filter and 100% efficiency. Tight-fitting powered air-purifying respirator with high efficiency filter. Full-face piece supplied-air respirator operated in demand mode. Half-mask or full-face piece supplied air respirator operated in continuous-flow mode.
<b>Type 3b Operations</b> (where concentrations of airborne lead would be expected to be > 2.50 mg/m <sup>3</sup> )	
Abrasive blasting of lead-containing coatings or materials.	NIOSH APF >=1000 Type CE abrasive-blast supplied respirator operated in a positive pressure mode with a tight-fitting half-mask face piece.

Refer to MOL *Guideline: Lead on Construction Projects, 2011*, for details of the Ministry's health and safety guidelines regarding lead.

## **6.9. Mercury**

### **6.9.1. General Information**

Mercury is a naturally occurring metal. It is a shiny, silver-white and odourless liquid. It combines with other elements to form inorganic compounds or salts. Metallic mercury is used to produce chlorine gas and caustic soda, and is used in thermostats and thermometers, fluorescent light bulbs, dental fillings and batteries. Exposure occurs when eating fish or shellfish contaminated with methyl mercury, breathing vapors from spills, incinerators, etc.

The nervous system is very sensitive to all forms of mercury. Exposure to high levels of metallic inorganic or organic mercury can permanently damage the brain, kidneys and developing fetus. Short-term exposure may cause lung damage, nausea, vomiting and diarrhea as well as skin and eye irritation.

### **6.9.2. Regulations**

The regulation for mercury applies to every employer and worker at a workplace where mercury is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to mercury. Exposure limits for this substance are set at 0.025 – 0.01 mg/m<sup>3</sup> (TWA) for all forms of mercury excluding alkyl, and for alkyl compounds of mercury 0.03 mg/m<sup>3</sup> (STEL).

### **6.9.3. Findings**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey.

### **6.9.4. Recommendations**

Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

## **6.10. Silica**

### **6.10.1. General Information**

Silica is a crystalline compound occurring abundantly as quartz, sand, and many other minerals, and used to manufacture a variety of materials, especially glass and concrete. When mining this substance, silica can be deadly when it becomes airborne. If inhaled, silica dust can cause silicosis which can be fatal.

Some of the following industries have a high potential for risk to workers: construction (sandblasting, rock drilling, masonry work, jack hammering, tunneling), mining (cutting or drilling through sandstone or granite), foundry work (grinding, mouldings, shakeout, core room), stone cutting (sawing, abrasive blasting, chipping, grinding), manufacturing and use of abrasives, etc.

### **6.10.2. Regulations**

The regulation for silica applies to every employer and worker at a workplace where silica is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to silica. Exposure limits for this substance are set at 0.05 - 0.10 mg/m<sup>3</sup> (TWA), depending on the type of silica.

Additionally, in 2011 the MOL revised *Guideline: Silica on Construction Projects* outlining practices that should be followed during construction projects to protect workers from exposure to silica. This includes the methods and equipment employed in the removal of silica-containing materials that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **6.10.3. Findings**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings.

### **6.10.4. Recommendations**

If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to MOL *Guideline: Silica on Construction Projects* for details.

## **6.11. Vinyl Chloride**

Vinyl chloride would not be expected to be present at the Site and was not observed during the current survey. No recommendations for vinyl chloride are warranted at this time.

## **6.12. Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work area(s). No action is recommended with regard to mould.

## 7.0. LIMITATIONS

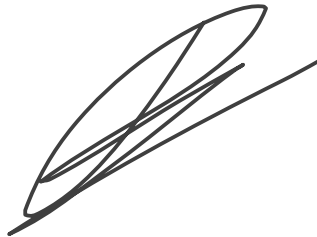

Fisher Environmental Ltd. accepts responsibility for the competent performance of its duties in executing this assignment within the normal standards of the profession, but disclaims responsibility for consequential damages, if any.

The scope of the survey is based on prior agreement with the client, and the rationale given in this report. The survey findings rely on professional interpretation of selective sampling and analysis. Sample analysis results have been applied to homogenous materials in unsampled locations; it was not within the scope of work to carry out an exhaustive sampling and analysis program. For non-accessible building spaces, the likelihood of the presence or absence of asbestos and other designated substances has been described, but such assessment is not a definitive statement of presence or absence.

This report was prepared for the IBI Group. The scope of services performed may not be appropriate for the purposes of other users, and any use or reuse of this document or its findings or recommendations represented herein is at the sole risk of any other user.

We trust that the information provided in the report meets your current requirements. If you have any questions or concerns, please do not hesitate to contact the undersigned.

Respectfully submitted,

Renata Stec, M.Sc.  
Project Manager

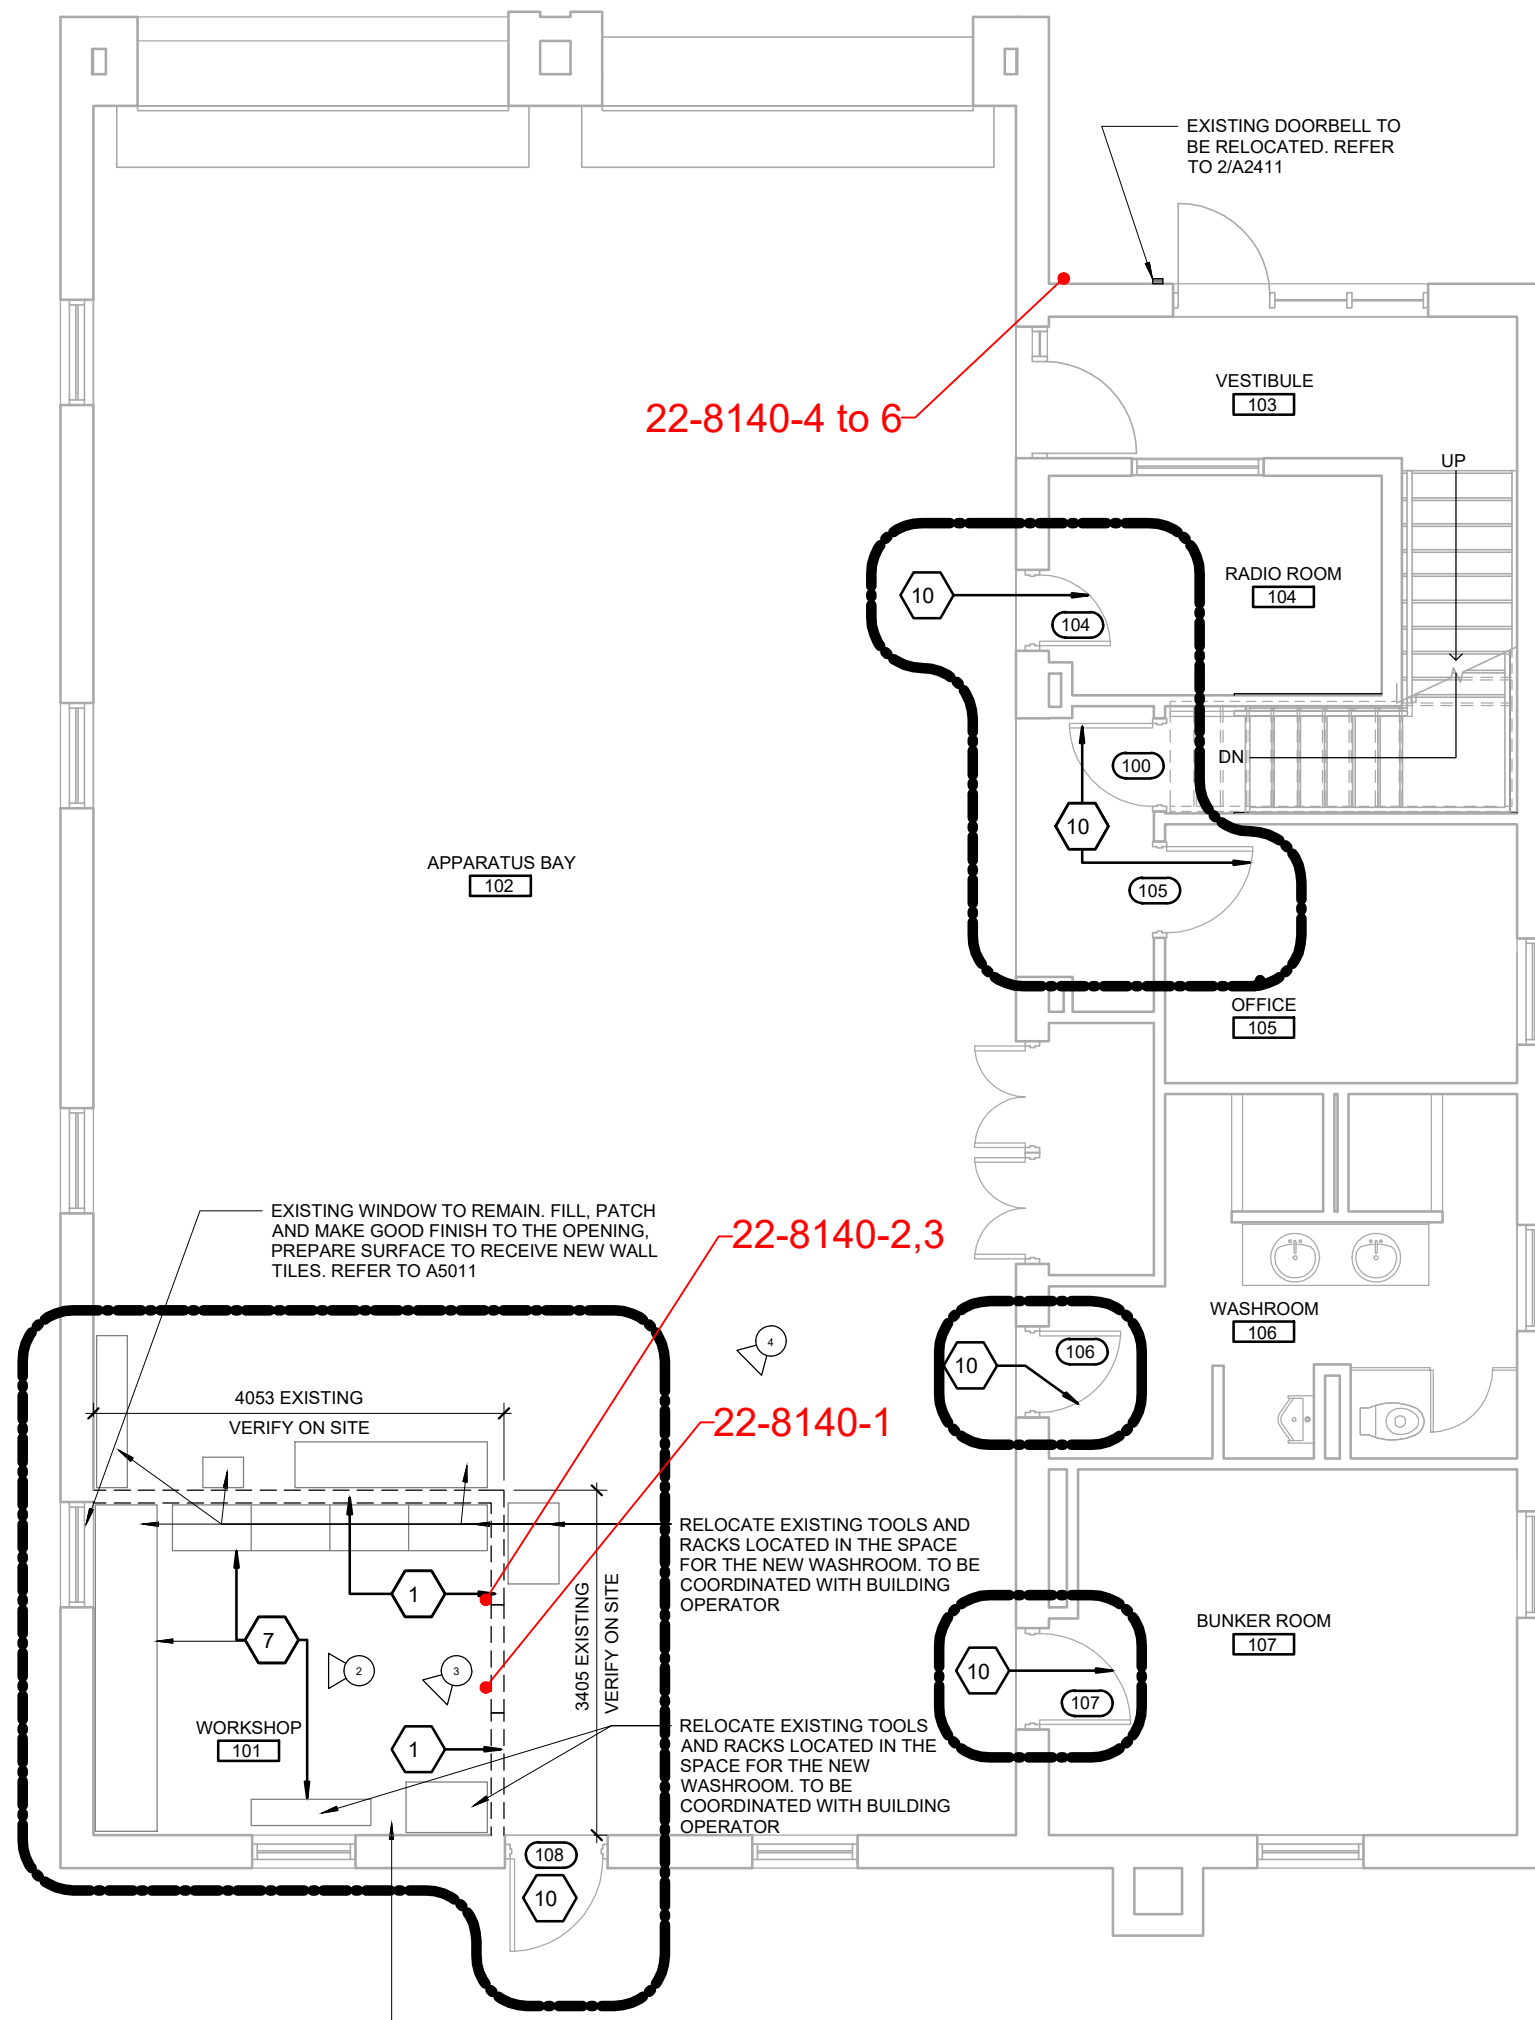

David Fisher, P. Eng., C. Chem.  
Principal

## **1. INTRODUCTION AND REGULATORY REQUIREMENTS**

### **1.1 Introduction and Scope**

Fisher Environmental Ltd. was retained by the City of Toronto, Facilities Management to conduct a Designated Substance Survey of building materials in Toronto Fire Station 123 located at 143 Bond Avenue in Toronto, Ontario.

The objectives of the Designated Substance Survey (DSS) are to establish locations, conditions and types of designated substances contained within a building and, if necessary, provide recommendations to fulfill requirements set forth under the Ontario Occupational Health and Safety Act (OHSA) to achieve regulatory compliance. Preparation of the DSS report, which includes a brief description of the materials present, and the findings of the DSS, will fulfill the requirements of the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 – Designated Substances and O. Reg. 278/05 – Asbestos on Construction Projects and in Buildings and Repair Operations.

The DSS should also include an examination for the presence of polychlorinated biphenyls (PCBs) and visible mould growth. This document should be filed as an addendum to the original survey, which was conducted by ECOH Management Inc. on July 31, 2007.

The *Designated Substance Survey* report is intended for management purposes only to demonstrate compliance with regulations. It is not to be used to establish the designated substance content within building materials before renovation or demolition activities. Prior to any work activities that may disturb building materials, a thorough Pre-Renovation or Pre-Demolition survey of the work area for designated substances and hazardous materials shall be conducted. Muhammad Junayed of Fisher Environmental Ltd. performed the fieldwork on June 10, 2016.

## **2. SURVEY METHODOLOGY**

### **2.1 General Approach**

To ensure familiarity with the building, the Surveyor made reference to the previous assessment and reassessment reports provided by the City of Toronto prior to commencing the survey. The Surveyor also made reference to facility floor plans included in the previous assessment reports, or provided independently by the City of Toronto. Facility drawings identifying locations of asbestos-containing materials, if present, are included in Appendix IV. Site photographs are included in Appendix V.

### **2.2 Survey Methodology**

The City of Toronto provided the consultant with the previous DSS report and / or other survey reports of designated substances identified within the facility, if available. Prior to conducting the DSS, the reports were reviewed by Fisher Environmental Ltd. and updated with all available information regarding ACM, including that from past assessments and reassessments.

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos*

*on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

The Surveyor conducted a visual reassessment of all known and assumed asbestos-containing materials in all accessible areas of the building, as detailed in past survey reports and the Reassessment Survey Form, and recorded the condition (GOOD, FAIR or POOR) of each known or assumed ACM on the Asbestos Reassessment Survey Form. The Surveyor also recorded detailed descriptions of previously-unidentified potential ACM, if observed. Please refer to Appendix I for the updated Reassessment Survey Form.

Materials confirmed to be asbestos-containing during previous assessments were not sampled for this reassessment survey. Additionally, samples were not collected of materials that were previously confirmed to be non-asbestos by the requirements of Ontario Regulation 278/05.

Any other potential asbestos-containing materials noted during the reassessment survey that had not been identified in a previous survey, or were not sampled in accordance with the requirements of O. Reg. 278/05, were sampled as part of the reassessment.

The DSS is based on a walk-through inspection of the facility and shall be conducted room by room to establish locations, conditions and types of designated substances. The survey shall also include an examination for the presence of polychlorinated biphenyls (PCBs) and visible mould growth.

### **3. FINDINGS AND RECOMMENDATIONS**

#### **3.1 Asbestos**

Asbestos fibres may be released into the air by the disturbance of asbestos containing material (ACM) during product use, demolition work, building or home maintenance, repair and remodeling. In general, exposure may occur only when the ACM is disturbed in some way to release particles and fibres into the air.

##### **3.1.1 Findings**

Previously identified assumed ACM include the following:

- Vinyl Floor Tile – one (1) variety,
- Plaster,
- Drywall Joint Compound,
- Roofing Materials, and
- Window Caulking.

All assumed ACM were observed to be in GOOD condition at the time of the reassessment.

No samples were collected for analysis of asbestos type and content during the current survey.

Unless previously determined to be non-asbestos, plaster, drywall joint compound, vinyl floor tiles, mastics and window caulking in other areas of the facility should continue to be assumed to be asbestos-containing, and should be sampled prior to renovation and/or demolition activities.

### 3.1.2 Recommendations

All assumed ACM were observed in GOOD condition at the time of the reassessment. Therefore, no recommended corrective actions are made at this time.

Any other building materials suspected to contain asbestos which are not outlined in this report should be assumed to be asbestos-containing until sample analysis determines asbestos content.

Ontario Ministry of Labour Regulation 278/05 requires that an Asbestos Management Program (AMP) be implemented as long as asbestos-containing materials are present in a building. The AMP, original survey report and subsequent reassessment reports must be available at the work place, and must identify the type of asbestos, and where asbestos can be found on a room-by-room basis.

**NOTE:** Interpretation of all sources of asbestos-related information, including but not limited to the original asbestos survey report, asbestos reassessment reports, room-by-room survey data, survey drawings and reports from previous asbestos abatement projects, should be completed by a competent person trained in the historical application of asbestos in building materials, building design and preferably by a person with site-specific knowledge and/or experience.

Information contained within any of the above-noted sources may not relieve the Regulatory responsibility of building Owners, or project Employers/Constructors, to complete a detailed site inspection prior to commencement of a project.

This report should not be used as a substitute for a detailed site inspection to identify asbestos-containing building materials, which must be specifically tailored to the scope and nature of any given project, and completed prior to any maintenance, renovation or demolition work that may cause disturbance to building materials.

## 3.2 Lead

Most lead in the environment comes from human activities such as burning fossil fuels, mining and manufacturing. Lead is used in the production of batteries, ammunition, metal products such as solder and pipes, and x-ray devices. Exposure happens when eating food or drinking water that contains lead. Deteriorated lead paint can contribute to lead dust. The main target for lead toxicity is the nervous system.

The regulation for lead applies to every employer and worker at a workplace where lead is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to lead.

Additionally, in 2004 the MOL issued *Guideline: Lead on Construction Projects* outlining practices that should be followed during construction projects to protect workers' from exposure to lead. This includes the methods and equipment employed in the removal of lead containing coatings that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### 3.2.1 Findings

Paint finishes were generally noted to be in Good condition throughout the Site. Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. During the current investigation, no lead samples were collected for analysis.

No other indication of lead containing materials was observed during the building audit, with the exception of that which may be contained within batteries.

### **3.2.2 Recommendations**

During the disturbance of any painted surfaces that contain lead, it would be recommended that appropriate procedures and use of respirators be followed to protect workers.

No immediate corrective actions were recommended with regard to lead.

## **3.3 Acrylonitrile**

Acrylonitrile is used to make other chemicals such as plastics, synthetic rubber and acrylic fibres. Breathing high concentrations of acrylonitrile will cause nose and throat irritation, tightness in chest, difficulty breathing, nausea, dizziness, weakness, headache, impaired judgment and convulsions. These symptoms usually disappear when exposure has stopped. If spilled on the skin, acrylonitrile will burn the skin and cause blisters and redness. Acrylonitrile is believed to be carcinogenic.

### **3.3.1 Findings**

Acrylonitrile based polymers may have been utilized in the production of some of the building construction materials (e.g. paints, sealants, and adhesives). Although these polymers are generally volatile, they are expected to produce significant acrylonitrile exposure only during or shortly after application of the subject material. If present on site, acrylonitrile would not be expected to be a concern during future renovation or demolition works. Acrylonitrile was not evident in its pure form anywhere within the subject areas of the building.

### **3.3.2 Recommendations**

No immediate corrective actions were recommended with regard to acrylonitrile.

## **3.4 Arsenic**

Inorganic arsenic compounds are mainly used to preserve wood. Organic arsenic compounds are used as pesticides. Arsenic occurs naturally in soil and minerals and therefore may enter air and water. Breathing high levels of arsenic may cause sore throat and irritated lungs. Ingesting high levels of arsenic can result in death. Arsenic is a suspected carcinogenic substance.

### **3.4.1 Findings**

Low levels of arsenic may be contained within paints or coatings utilized on building construction materials, however exposure levels resulting from personal contact are not expected to be significant. Arsenic or arsenic containing compounds were not encountered during the building survey works.

### **3.4.2 Recommendations**

No immediate corrective actions were recommended with regard to arsenic.

### **3.5     *Benzene***

Benzene is colourless liquid with a sweet odour. Benzene utilization has historically been associated with solvents, paints, stains, adhesives, and in the manufacturing of various rubber products. While its current use in building materials has greatly decreased due to an increased awareness of associated health concerns, it may still be present in trace quantities in various industrial solvents. Gasoline sold in Canada contains approximately 4% benzene.

Breathing very high levels of benzene can result in death, while high levels may cause drowsiness, dizziness, rapid heart rate, headaches, and unconsciousness.

#### **3.5.1   Findings**

While it may be expected, given the age of the building, that the original construction materials utilized did contain some trace levels of benzene, it is likely that any has since volatilized and would not exceed the permissible exposure values. During future renovation or demolition works, it would not be expected to be a concern. No evidence of benzene was noted during the building survey, with the exception of that which may be contained in regular gasoline fuel burning equipment. One underground diesel storage tank and associated fuel pump were noted on the property.

#### **3.5.2   Recommendations**

No immediate corrective actions were recommended with regard to benzene.

### **3.6     *Coke Oven Emissions***

Coke oven emissions are released during the carbonization of bituminous coal for the production of coke. Exposure routes include inhalation, skin and / or eye contact. Coke oven emissions are potential occupational carcinogens.

#### **3.6.1   Findings**

This substance would not be expected to be found in the building. No evidence of the burning of coke was found during the building survey.

#### **3.6.2   Recommendations**

No immediate corrective actions were recommended with regard to coke oven emissions.

### **3.7     *Ethylene Oxides***

Ethylene oxide is a man-made chemical used primarily to make ethylene glycol (antifreeze and polyester). Breathing low levels of ethylene oxides for a prolonged period of time causes eye, skin and respiratory irritations, and can affect nervous system. Higher levels of exposure for shorter time produce symptoms that are similar but more severe.

#### **3.7.1   Findings**

This substance would not be expected to be found in the building. No evidence of ethylene oxides was found during the building survey.

### **3.7.2 Recommendations**

No immediate corrective actions were recommended with regard to ethylene oxides.

## **3.8 Isocyanates**

Isocyanates are a family of highly reactive, low molecular weight chemicals. They are widely used in the manufacture of flexible and rigid foams, fibres, and coatings such as paints and varnishes, and elastomers and various building materials (e.g. spray on polyurethane products).

Isocyanates are powerful irritants to the eyes, skin, and respiratory and gastrointestinal tracts.

### **3.8.1 Findings**

Use of isocyanates or isocyanate compounds would not be expected in the building. No evidence of isocyanates was found during the building survey.

### **3.8.2 Recommendations**

No immediate corrective actions were recommended with regard to isocyanates.

## **3.9 Mercury**

Mercury is a naturally occurring metal. It is a shiny, silver-white and odourless liquid. It combines with other elements to form inorganic compounds or salts. Metallic mercury is used to produce chlorine gas and caustic soda, and is used in thermostats and thermometers, fluorescent light bulbs, dental fillings and batteries. Exposure occurs when breathing vapors from spills, incinerators, etc.

The nervous system is very sensitive to all forms of mercury. Exposure to high levels of metallic inorganic or organic mercury can permanently damage the brain, kidneys and developing fetus. Short-term exposure may cause lung damage, nausea, vomiting and diarrhea as well as skin and eye irritation.

### **3.9.1 Findings**

Mercury can be found in fluorescent light bulbs and building thermostats. Prior to future renovation or demolition works, it would be recommended that these products be safely removed. The disposal of mercury containing items are regulated under the Environmental Protection Act, and it would be recommended that for disposal purposes any mercury containing thermostats and fluorescent light bulbs be disposed of at an MOE licensed receiver. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the building survey.

### **3.9.2 Recommendations**

No immediate corrective actions were recommended with regard to mercury.

## **3.10 Silica**

Silica is a crystalline compound occurring abundantly as quartz, sand, and many other minerals, and used to manufacture a variety of materials, especially glass and concrete. When mining this substance, silica can be deadly when it becomes airborne. If inhaled, silica dust can cause silicosis which can be fatal.

Additionally, in 2004 the MOL issued *Guideline: Silica on Construction Projects* outlining practices that should be followed during construction projects to protect workers' from exposure to silica. This includes the methods and equipment employed in the removal of silica containing materials that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **3.10.1 Findings**

As the building is constructed of concrete block and brick, with concrete floors, silica is expected to be found within these components of the building. During any significant renovation or demolition works where concrete dust is generated, dust suppression techniques should be utilized to control worker exposure to silica. Silica is expected to be present in concrete and masonry products in the building.

### **3.10.2 Recommendations**

No immediate corrective actions were recommended with regard to silica.

## **3.11 Vinyl Chloride**

Vinyl chloride is used to make polyvinyl chloride (PVC) which is found in a variety of plastic products, including pipes, wires, cable coatings and packaging materials. Breathing high levels of vinyl chloride can cause dizziness, unconsciousness and death. Prolonged exposure causes changes in liver, nerve damage, immune reactions and changes in blood flow.

### **3.11.1 Findings**

PVC pipe is generally stable and does not allow for the liberation of vinyl chloride, under normal conditions. During future renovation or demolition works, this substance would not be expected to be a concern. Vinyl chloride was not evident in its pure form, anywhere in the subject dwellings.

### **3.11.2 Recommendations**

No immediate corrective actions were recommended with regard to vinyl chloride.

## **3.12 Polychlorinated Biphenyls (PCBs)**

PCBs are mixtures of synthetic organic chemicals with the same basic chemical structure and similar physical properties ranging from oily liquids to waxy solids. Due to their non-flammability, chemical stability, high boiling point and electrical insulating properties, PCBs were used in hundreds of industrial and commercial applications including electrical, heat transfer, and hydraulic equipment; as plasticizers in paints, plastics and rubber products; in pigments, dyes and carbonless copy paper and many other applications.

PCBs have been demonstrated to cause a variety of adverse health effects. PCBs have been shown to cause cancer.

### **3.12.1 Findings**

No PCB containing equipment with the potential exception of fluorescent lighting ballasts was observed on site. Fluorescent lighting was observed in use in several areas of the building and inspection of three random light ballasts revealed that they did not contain PCB's. The disposal of PCB containing equipment is regulated under MOE Reg. 558, and it would be recommended that

during any ballast replacement works the generated ballasts be evaluated for PCB content, with any PCB ballasts being consolidated and sent for disposal to an MOE licensed PCB receiver under waste class 243D.

### **3.12.2 Recommendations**

It would be recommended that during any ballast replacement works the generated ballasts be evaluated for PCB content. Any PCB ballasts identified should be consolidated and sent for disposal to an MOE licensed PCB receiver under waste class 243D.

## **3.13 Mould**

Mould contamination inside buildings has become a concern to both building owners and occupants. Exposure to moulds is known to cause a variety of health effects in some people. Many fungal spores are considered to be allergenic to susceptible persons, though individual susceptibility varies greatly.

Elevated levels of indoor mould are usually attributed to the chronic moist conditions due to water leaks, floods or elevated humidity. Under these conditions, already low levels of fungal spores in air from plants and other sources may multiply on cellulose containing materials such as carpets, wallboards, and wood, and result in mould contamination and, if left untreated, can be destructive to certain building materials.

At present, no Federal or Provincial regulations are in effect with respect to reasonable levels of airborne mould spores and other contaminants inside buildings. Health Canada has provided strategies and guidelines related to some indoor contaminants to assist in conducting indoor air quality investigations in their publication *Indoor Air Quality in Office Buildings: A Technical Guide*, 1995. Health Canada recommends that indoor varieties of airborne mould spores should be qualitatively and quantitatively similar to those varieties found outdoors. The presence of one or more fungal species indoors that are not found outdoors suggests the presence of an amplifier in the building.

An additional resource that places numerical limits on acceptable indoor fungal spores is found in the Calgary Health Region's guidelines for *Fungal Air Testing, Investigation and Reporting* for remediated marijuana grow houses. These guidelines suggest that indoor fungal spores are acceptable if found to be elevated by as much as 2 or 3 times the outdoor measurement, depending on the type of mould spore. Refer to attached guidelines.

The Canadian Construction Association (CCA) has provided guidelines regarding investigation and remediation works in *CCA82 - 2004 Mould Guidelines for the Canadian Construction Industry* to protect the health and safety of workers who may be exposed to mould in the course of building renovations.

### **3.13.1 Findings**

During the current investigation, no visible mould or favourable conditions for mould growth were observed in the surveyed areas.

### **3.13.2 Recommendations**

No immediate corrective action is recommended with regard to mould contamination.

#### 4. CORRECTIVE ACTIONS

No corrective actions for Designated Substances were recommended.

#### 5. STATEMENT OF LIMITATIONS

Fisher Environmental Ltd. accepts responsibility for the competent performance of its duties in executing this assignment within the normal standards of the profession, but disclaims responsibility for consequential damages, if any.

The extent of the building survey of asbestos containing materials (ACM) and other designated substances is based on prior agreement of the scope of work with the client, and the rationale given in this report. The building survey findings rely on professional interpretation of selective sampling and analysis. Sample analysis results have been applied to homogenous materials in unsampled locations; it was not within the scope of work to carry out an exhaustive sampling and analysis program. For non-accessible building spaces, the likelihood of the presence or absence of asbestos and other designated substances has been described, but such assessment is not a definitive statement of presence or absence.

This report was prepared for the City of Toronto, Facilities Management. The scope of services performed may not be appropriate for the purposes of other users, and any use or reuse of this document or its findings or recommendations represented herein is at the sole risk of any other user.

We trust that the information provided in the report meets your current requirements. If you have any questions or concerns, please do not hesitate to contact the undersigned.

#### 6. SIGN-OFF

We trust that this report meets with City of Toronto requirements and we thank you for the opportunity to be of service. Should you have any questions, please do not hesitate to contact us.

Fisher Environmental Ltd.

## 1.0. EXECUTIVE SUMMARY

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work area(s) for Toronto Police Services-Drug Squad building located at 160 Duncan Mill Road, Toronto, Ontario, herein after referred to as the "Site". The site inspection and sampling works were conducted on March 17, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

### **Asbestos**

Fisher was provided with the report of a previous DSS, which was conducted by Pinchin Environmental Ltd. on December 20, 2017. This report indicates no identified assumed or confirmed ACM within the specified work area(s).

During the current survey, twelve (12) bulk samples of building materials found within the specified work area(s) and that could potentially contain asbestos, were collected and submitted to Fisher Environmental Laboratories for Polarised Light Microscopy (PLM) analysis, as outlined in NIOSH Method 9002.

The results of analysis revealed that each material sampled does not contain asbestos. Provide a copy of this report to contractors bidding on or performing work within the subject work areas.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

## **Lead**

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current survey, two (2) bulk samples of navy blue, and yellow paint were collected and submitted to Fisher Environmental Laboratories for lead analysis. The results of analysis revealed that navy blue wall paint contains <10 ppm of lead, and the yellow asphalt paint contains 323 ppm of lead.

Fisher recommends that, prior to the planned renovation work, the removal of lead containing materials found within the specified work area(s), must be conducted using the appropriate lead abatement procedures. Lead abatement procedures to be used are determined by the method(s) of disturbance employed. Refer to *MOL Guideline: Lead on Construction Projects*, for details

## **Mercury**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey. Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

## **Silica**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings. If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to *MOL Guideline: Silica on Construction Projects* for details.

## **Other Designated Substances**

The other Designated Substances would not be expected to be present at the Site. No immediate actions were recommended with regard to acrylonitrile, arsenic, benzene, coke oven emissions, ethylene oxide, isocyanates, and vinyl chloride.

## **Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work area(s). No action is recommended with regard to mould.

## 2.0. INTRODUCTION

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work area(s) for Toronto Police Services-Drug Squad building located at 160 Duncan Mill Road, Toronto, Ontario, herein after referred to as the "Site". The site inspection and sampling works were conducted on March 17, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

## 3.0. REGULATIONS

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

The OHSA, R.S.O. 1990, under the Ontario MOL, defines a toxic substance as a biological, chemical or physical agent (or a combination of such agents) whose presence in the workplace may endanger the health and safety of a worker. Sections of the Act that deals with toxic substances are intended to:

1. ensure that worker exposure to toxic substances is controlled;
2. ensure that toxic substances in the workplace are clearly identified and that workers are provided with enough information to be capable of handling them safely; and,
3. provide the general public with access to information about toxic substances used by industry in their communities.

The Act makes provision for a toxic substance to be "designated", where its use in the workplace is prohibited, regulated, restricted, limited or controlled. Designation is reserved for eleven substances that are particularly hazardous, covered under O. Reg 490/09 – *Designated Substances* that was implemented on July 1, 2010, and include Acrylonitrile, Arsenic, Asbestos, Benzene, Coke Oven Emissions, Ethylene Oxides, Isocyanates, Lead, Mercury, Silica, and Vinyl

Chloride. Formerly, regulations for these substances were passed separately and each outlined exposure limits where workers were likely to inhale, ingest and / or absorb the substance.

O. Reg. 490/09 provides a consistent approach to dealing with existing requirements and provisions, and outlines steps required to control worker exposure to these substances, including by inhalation, ingestion, skin absorption or skin contact. Each designated substance has an allowable level of exposure based on a time-weighted average (TWA) limit, and may also have a short-term exposure limit (STEL) and / or ceiling limit (C) assigned to it. TWA refers to the time-weighted average airborne concentration of a biological or chemical agent to which a worker may be exposed in a work day or work week, STEL refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed in any 15 minute period, and C refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed at any time. Refer to O. Reg. 490/09 – *Designated Substances*.

A supplementary regulation regarding control of asbestos exposures in the construction industry has evolved into O. Reg. 278/05 – *Asbestos on Construction Projects and in Buildings and Repair Operations*. The regulation includes a definition of asbestos-containing materials (ACM), requirements for additional training and clearance air testing, procedures for determining materials that meet the definition of ACM and for the use of glove bags, and provisions for varying from measure and procedures set out in the regulation.

In addition to the OHSA and regulations regarding designated substances, the following regulations, guidelines and standards were also taken into account or referenced:

- O. Reg. 213/91 - *Construction Projects* regulated under the OHSA and last amended by O. Reg. 443/09;
- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*;
- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes;
- MOL *Guideline: Lead on Construction Projects*, 2011; and,
- MOL *Guideline: Silica on Construction Projects*, 2011.

## 4.0. METHODOLOGY

Fisher followed the protocols outlined in O. Reg. 278/05 for collecting and analyzing bulk samples of materials suspected to contain asbestos. Visual assessment of the material was the primary method of identification with occasional physical contact for the purpose of collecting bulk samples or examining for underlying layers.

Where applicable, samples of suspect materials were collected in order to establish asbestos or lead content. Samples were grouped according to similarity of appearance (“homogeneous”

materials). The frequency at which the samples were collected was sufficient to obtain a general representation of the presence of these materials at the Site. Samples collected are presumed to be representative of respective building materials in-place at the Site. However, due to potential past renovations, alterations, repairs, or phases of construction, it is possible that individual materials may not be representative of samples collected.

Sampling of roofing materials was not part of the current scope of work. Further, sampling of materials found within operating equipment, portable building articles, or generally non-accessible components such as insulation within electrical switch gears, wiring, motors, light fixtures, elevator brakes, fire door cores, etc. was not performed as part of the current survey.

Samples collected during the survey were placed in plastic zip-lock bags which were labeled and submitted for laboratory analysis. Fisher Environmental Laboratories analysed bulk samples for asbestos type and approximate percent content by performing polarized light microscopy (PLM), as outlined in NIOSH Method 9002. Fisher Environmental Laboratories analysed samples for lead content in paint by performing acid digestion followed by Inductively Coupled Plasma (ICP) analysis.

Site Plan(s), indicating specific work area(s) and bulk sample locations, are included in Appendix A. The laboratory certificate(s) of analysis are included in Appendix B. Representative photos of Site conditions encountered at the time of the current survey are included in Appendix C.

## **5.0. REVIEW OF PREVIOUS REPORTS**

Fisher was provided with the report of a previous DSS, which was conducted by Pinchin Environmental Ltd. on December 20, 2017, attached in Appendix D. This report indicates no identified assumed or confirmed ACM within the specified work area(s).

## **6.0. FINDINGS AND RECOMMENDATIONS**

### **6.1. *Acrylonitrile***

Acrylonitrile would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Acrylonitrile are warranted at this time.

### **6.2. *Arsenic***

Arsenic would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Arsenic are warranted at this time.

## **6.3. Asbestos**

### **6.3.1. General Information**

Asbestos is the name given to a group of six different fibrous minerals (amosite, chrysotile, crocidolite, and the fibrous varieties of tremolite, actinolite and anthophyllite) that occur naturally in the environment. Asbestos minerals have separable long fibres that are strong and flexible enough to be spun and woven and are heat resistant.

Because of these characteristics, asbestos has been used for a wide range of manufactured goods, mostly in building materials (roofing shingles, ceiling and floor tiles, paper products, and asbestos cement products), friction products (automobile clutch, brake, and transmission parts), heat-resistant fabrics, packaging, gaskets, and coatings. Some vermiculite or talc products may also contain asbestos.

Asbestos fibres may be released into the air by the disturbance of ACM during product use, renovation or demolition work, building or home maintenance, repair and remodeling. In general, exposure may occur only when the ACM is disturbed in some way to release particles and fibres into the air.

### **6.3.2. Friable vs. Non-Friable ACM**

Based on the requirements of O. Reg. 278/05 and due diligence, an asbestos survey and report must be available at any workplace where asbestos exists identifying locations and types of ACM in the building. The survey must include both friable and non-friable materials confirmed to contain asbestos, as well as any other materials which were not sampled but are suspected (presumed) ACM. The term friable refers to material(s) that could be readily reduced to dust or powder when crushed by hand or moderate pressure. Friable materials have a much greater chance of releasing airborne asbestos fibres when disturbed.

In the past, the most commonly used friable asbestos-containing building materials were surfacing materials (e.g. sprayed on fireproofing, texture, decorative or acoustic plaster) as well as thermal insulation. Examples of manufactured asbestos-containing materials include vinyl floor tiles, ceiling tiles, gasket materials, asbestos cement (transite) pipes or boards, and asbestos textiles. Depending on the above noted formulation, these materials range from non-friable to friable. Although some products are considered non-friable when in Good condition, severe damage or deterioration may cause non-friable materials to generate airborne dust more readily. Severely damaged non-friable materials, or those to be worked on with powered tools, may be considered as friable ACM for abatement purposes.

Examples of common types of ACM by friability include:

- Friable ACM

- Sprayed Materials (or materials installed by roller or trowel), such as fireproofing, thermal insulation, texture finishes, etc.
  - Mechanical Insulation such as boiler and breeching, ductwork, piping, tanks and associated equipment.
  - Plaster
- Potentially Friable ACM
  - Acoustic Ceiling Tiles
  - Vinyl Sheet Flooring
- Non-Friable ACM
  - Vinyl Floor Tiles
  - Asbestos cement (“transite”) piping or paneling
  - Window Caulking

### 6.3.3. Regulations

Exposure to asbestos is controlled by two Regulations passed under Ontario’s Occupational Health and Safety Act (OHSA), R.R.O. 1990.

- O. Reg. 490/09 – *Designated Substances* regarding asbestos applies to:
  - every employer operating a mine for the purpose of mining, crushing, grinding or sifting asbestos;
  - every employer processing, adapting or using asbestos in connection with manufacturing or assembling of goods or products;
  - every employer engaged in the repair, alteration or maintenance of machinery, equipment, aircraft, ships, locomotives, railway cars and vehicles;
  - every employer engaged in work on a building that is necessarily incidental to the repair, alteration or maintenance of machinery or equipment; and,
  - to those workers of such employers who are likely to be exposed to asbestos.

Exposure limits for this substance are set at 0.1 f/cc (TWA) for all types of asbestos.

- O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* applies to buildings that contain friable and non-friable ACM and to the repair, alteration and/or maintenance of these buildings.

In addition to regulations for controlling work around asbestos-containing building materials there are regulations for packaging, transportation and disposal of asbestos-containing waste:

- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*; and,

- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes.

#### **6.3.4. Findings**

Samples of homogenous materials suspected to contain asbestos were collected and submitted for analysis. Fisher collected twelve (12) bulk samples of building materials found within the specified work area(s) and that could potentially contain asbestos. Findings of all building materials identified within the specified work area(s) are outlined in further detail below.

##### **6.3.4.1. Sprayed or Troweled Fireproofing and Thermal Insulation**

No indication of sprayed or troweled fireproofing and / or thermal insulation was noted in any of the specified work area(s) during the current survey.

##### **6.3.4.2. Texture Finish**

No texture finish was noted in any of the specified work area(s) during the current survey.

##### **6.3.4.3. Mechanical Insulation**

No indication of mechanical insulation was noted in any of the specified work area(s).

##### **6.3.4.4. Acoustic Ceiling Tile**

During the survey, one (1) type of ceiling tile was observed within the specific work areas.

- Ceiling Tiles 1 (2'x4' Random Pinholes with Flecks).

The previous report confirmed that Ceiling Tile 1 was sampled for analysis. The results of analysis revealed this ceiling tile does not contain asbestos.

##### **6.3.4.5. Plaster / Drywall Joint Compound**

Plaster was not observed within the specified work areas during the survey. Drywall Joint Compound (DJC) was observed throughout the building. During the current survey, three (3) samples of DJC was collected and submitted for analysis. The results of analysis revealed that the DJC does not contain asbestos.

##### **6.3.4.6. Asbestos Cement Products**

No asbestos cement products, such as Transite pipe or board, were noted in any of the specified work area(s) during the current survey.

##### **6.3.4.7. Vinyl Sheet Flooring**

During the current survey, one (1) variety of vinyl sheet flooring was observed within the specified work areas.

- Vinyl Sheet Flooring 1 (White with Blue Specs).

The previous report confirmed that Vinyl Sheet Flooring 1 was sampled for analysis. The results of analysis revealed this type of vinyl sheet flooring do not contain asbestos.

#### **6.3.4.8. Vinyl Floor Tile**

During the current survey, one (1) variety of vinyl floor tile was observed within the specified work areas.

- Vinyl Floor Tile 2 (Light Grey with brown & white flecks).

The previous report confirmed that Vinyl Floor Tile 2 was sampled for analysis. The results of analysis revealed this type of vinyl floor tile do not contain asbestos.

#### **6.3.4.9. Other ACM**

##### Grey Caulking

Grey caulking was observed between wall and door frame. Three (3) samples of the grey caulking were collected for analysis. The results of analysis revealed that the grey caulking does not contain asbestos.

##### Grey Putty

Grey putty was observed between door frame and glass. Three (3) samples of the grey putty were collected for analysis. The results of analysis revealed that the grey putty does not contain asbestos.

##### Mortar

Mortar was observed on the block wall. Three (3) samples of the mortar were collected for analysis. The results of analysis revealed that the mortar does not contain asbestos.

#### **6.3.5. Recommendations**

No asbestos-containing materials were identified in any of the specified work area(s). Therefore, no recommendations with regards to ACM are warranted at this time.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

The presence of ACM should be presumed in locations not accessed during this survey. It is possible that ACM is present at the Site that is not identified in this report. Should additional suspected ACM be discovered, it should be presumed as ACM until sample analysis determines asbestos content.

Due to the limited nature of the current scope of work and the presence of solid building finishes (i.e. plaster or drywall walls and ceilings etc.) in many locations, the full extent of ACM may not be confirmed. Precautions should be taken when dismantling solid wall or ceiling finishes, or any other building surfaces which may conceal potential ACM. Such precautions include, but are not limited to, isolation measures and appropriate personal protective equipment.

#### **6.4. Benzene**

Benzene would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Benzene are warranted at this time.

#### **6.5. Coke Oven Emissions**

Coke oven emissions would not be expected to be present at the Site and were not observed during the current survey. No recommendations for coke oven emissions are warranted at this time.

#### **6.6. Ethylene Oxides**

Ethylene oxides would not be expected to be present at the Site and were not observed during the current survey. No recommendations for ethylene oxides are warranted at this time.

#### **6.7. Isocyanates**

Isocyanates would not be expected to be present at the Site and were not observed during the current survey. No recommendations for isocyanates are warranted at this time.

#### **6.8. Lead**

##### **6.8.1. General Information**

Lead is a naturally occurring bluish-gray metal found in small amounts in the earth's crust. Most lead in the environment comes from human activities such as burning fossil fuels, mining and manufacturing. Lead is used in the production of batteries, ammunition, metal products (solder and pipes) and X-ray devices.

Lead does not break down but lead compounds are changed by sunlight, air and water. Exposure occurs when eating food or drinking water that contains lead. Deteriorated lead paint can contribute to lead dust. The main target for lead toxicity is the nervous system.

##### **6.8.2. Regulations and Guidelines**

The Ontario MOL has not prescribed criteria defining an analyzed sample of bulk material as "lead-containing". Further, the MOL has not established a lower limit for concentrations of lead in paint, below which precautions do not need to be considered during construction projects. However, except for very aggressive disturbance of painted finishes, (e.g., abrasive blasting, torch cutting, or grinding), Fisher believes that a lead content below 0.1% by weight (1,000 ug/g or 1000

ppm) represents a concentration in which the lead content is not the limiting hazard for construction hygiene purposes. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations.

The regulation for the designated substance lead applies to every employer and worker at a workplace where lead is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to lead. Exposure limits for this substance are set at 0.05 – 0.10 mg/m<sup>3</sup> (TWA) depending on the type of lead, and for tetraethyl lead 0.30 mg/m<sup>3</sup> (STEL).

Additionally, in 2011 the MOL revised *Guideline: Lead on Construction Projects* outlining practices that should be followed during construction projects to protect workers from exposure to lead. This includes the methods and equipment employed in the removal of lead-containing coatings that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### 6.8.3. Findings

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current survey, two (2) bulk samples of navy blue, and yellow paint were collected and submitted to Fisher Environmental Laboratories for lead analysis. The results of analysis revealed that navy blue wall paint contains <10 ppm of lead, and the yellow asphalt paint contains 323 ppm of lead.

### 6.8.4. Recommendations

Where any lead-containing materials may be disturbed or removed, Fisher recommends that appropriate lead abatement procedures be used. The lead abatement procedures to be used are determined by the method(s) of disturbance employed. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations. The table below outlines lead abatement operations and associated respirator required, as outlined in Ontario MOL guidelines.

#### Classifications of Lead-Containing Operations and Required Respirator

<b>Type 1 Operations</b> (where concentrations of airborne lead would be expected to be < 0.05 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Removal of lead containing coatings with chemical gel or paste and fibrous laminated cloth wrap</li> <li>• Removal of lead containing coatings / materials using power tool that has an effective dust collection system equipped with HEPA filter</li> <li>• Removal of lead containing coatings / materials using non-powered hand tools other than manual scraping or sanding</li> </ul>	Respirators should not be necessary if general procedures are followed and level of air is less than 0.05 mg/m <sup>3</sup> . However, if worker wishes to use a respirator, a half-mask particulate respirator with N-, R- or P-series filter, and 95, 99 or 100% efficiency should be provided.
<b>Type 2a Operations</b> (where concentrations of airborne lead would be expected to be > 0.05 to 0.50 mg/m <sup>3</sup> )	

Activities that include; <ul style="list-style-type: none"> <li>• Removal of lead containing coatings / materials by scraping or sanding using non-powered hand tools</li> <li>• Manual demolition of lead painted plaster walls / building components by striking with a sledgehammer or similar tool</li> </ul>	NIOSH APF = 10 Half-mask particulate respirator with N-, R- or P- series filter, and 95, 99 or 100% efficiency.
<b>Type 2b Operations</b> (where concentrations of airborne lead would be expected to be > 0.50 to 1.25 mg/m <sup>3</sup> )	
Not applicable to potential renovation activities.	
<b>Type 3a Operations</b> (where concentrations of airborne lead would be expected to be > 1.25 to 2.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Welding or high temperature cutting of lead-containing coatings or materials indoors or in a confined space.</li> <li>• Dry removal of lead-containing mortar using an electronic or pneumatic cutting device.</li> <li>• Burning of a surface containing lead</li> <li>• Removal of lead containing coatings / materials using power tools without an effective dust collection system equipped with HEPA filter</li> </ul>	NIOSH APF = 50 Full-face piece air-purifying respirator with N-, R- or P- series filter and 100% efficiency. Tight-fitting powered air-purifying respirator with high efficiency filter. Full-face piece supplied-air respirator operated in demand mode. Half-mask or full-face piece supplied air respirator operated in continuous-flow mode.
<b>Type 3b Operations</b> (where concentrations of airborne lead would be expected to be > 2.50 mg/m <sup>3</sup> )	
Abrasive blasting of lead-containing coatings or materials.	NIOSH APF >=1000 Type CE abrasive-blast supplied respirator operated in a positive pressure mode with a tight-fitting half-mask face piece.

Refer to MOL *Guideline: Lead on Construction Projects, 2011*, for details of the Ministry's health and safety guidelines regarding lead.

## 6.9. Mercury

### 6.9.1. General Information

Mercury is a naturally occurring metal. It is a shiny, silver-white and odourless liquid. It combines with other elements to form inorganic compounds or salts. Metallic mercury is used to produce chlorine gas and caustic soda, and is used in thermostats and thermometers, fluorescent light bulbs, dental fillings and batteries. Exposure occurs when eating fish or shellfish contaminated with methyl mercury, breathing vapors from spills, incinerators, etc.

The nervous system is very sensitive to all forms of mercury. Exposure to high levels of metallic inorganic or organic mercury can permanently damage the brain, kidneys and developing fetus. Short-term exposure may cause lung damage, nausea, vomiting and diarrhea as well as skin and eye irritation.

### 6.9.2. Regulations

The regulation for mercury applies to every employer and worker at a workplace where mercury is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to mercury. Exposure limits for this substance are set at 0.025 – 0.01 mg/m<sup>3</sup> (TWA) for all forms of mercury excluding alkyl, and for alkyl compounds of mercury 0.03 mg/m<sup>3</sup> (STEL).

### **6.9.3. Findings**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey.

### **6.9.4. Recommendations**

Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

## **6.10. Silica**

### **6.10.1. General Information**

Silica is a crystalline compound occurring abundantly as quartz, sand, and many other minerals, and used to manufacture a variety of materials, especially glass and concrete. When mining this substance, silica can be deadly when it becomes airborne. If inhaled, silica dust can cause silicosis which can be fatal.

Some of the following industries have a high potential for risk to workers: construction (sandblasting, rock drilling, masonry work, jack hammering, tunneling), mining (cutting or drilling through sandstone or granite), foundry work (grinding, mouldings, shakeout, core room), stone cutting (sawing, abrasive blasting, chipping, grinding), manufacturing and use of abrasives, etc.

### **6.10.2. Regulations**

The regulation for silica applies to every employer and worker at a workplace where silica is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to silica. Exposure limits for this substance are set at 0.05 - 0.10 mg/m<sup>3</sup> (TWA), depending on the type of silica.

Additionally, in 2011 the MOL revised *Guideline: Silica on Construction Projects* outlining practices that should be followed during construction projects to protect workers from exposure to silica. This includes the methods and equipment employed in the removal of silica-containing materials that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **6.10.3. Findings**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings.

#### **6.10.4. Recommendations**

If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to MOL *Guideline: Silica on Construction Projects* for details.

#### **6.11. Vinyl Chloride**

Vinyl chloride would not be expected to be present at the Site and was not observed during the current survey. No recommendations for vinyl chloride are warranted at this time.

#### **6.12. Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work area(s). No action is recommended with regard to mould.

## 7.0. LIMITATIONS

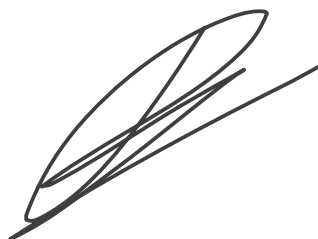

Fisher Environmental Ltd. accepts responsibility for the competent performance of its duties in executing this assignment within the normal standards of the profession, but disclaims responsibility for consequential damages, if any.

The scope of the survey is based on prior agreement with the client, and the rationale given in this report. The survey findings rely on professional interpretation of selective sampling and analysis. Sample analysis results have been applied to homogenous materials in unsampled locations; it was not within the scope of work to carry out an exhaustive sampling and analysis program. For non-accessible building spaces, the likelihood of the presence or absence of asbestos and other designated substances has been described, but such assessment is not a definitive statement of presence or absence.

This report was prepared for the IBI Group. The scope of services performed may not be appropriate for the purposes of other users, and any use or reuse of this document or its findings or recommendations represented herein is at the sole risk of any other user.

We trust that the information provided in the report meets your current requirements. If you have any questions or concerns, please do not hesitate to contact the undersigned.

Respectfully submitted,

Renata Stec, M.Sc.  
Project Manager

David Fisher, P. Eng., C. Chem.  
Principal

## EXECUTIVE SUMMARY

The City of Toronto (Client) retained Pinchin Ltd. (Pinchin) to conduct a Designated Substance survey of Toronto Police Services – Drug Squad, located at 160 Duncan Mill Road, Toronto, Ontario. The survey was performed on December 20, 2017.

The objective of the survey was to document any changes in condition and quantity of specified Designated Substances, polychlorinated biphenyls (PCBs) and mould identified in the previous Designated Substances Survey (Pinchin File 113698.005), and develop corrective action plans as required. The results of this survey are not intended for construction, renovation, demolition or project tendering purposes.

The assessed area consisted of the entire building. The building was occupied at the time of the survey.

## SUMMARY OF FINDINGS

Asbestos: Asbestos-containing materials (ACM) were assumed to be present as follows:

- Roofing materials.
- Exterior window caulking.

Lead: Lead may be present in emergency light batteries.

Silica: Crystalline silica is present in concrete, mortar, brick, masonry, ceramics and asphalt.

Mercury: Mercury vapour may be present in fluorescent lamps.

Polychlorinated Biphenyls (PCBs): PCB-containing materials were not confirmed.

Mould: Mould-impacted materials were not observed.

## SUMMARY OF RECOMMENDATIONS

The following is a summary of significant recommendations; refer to the body of the report for detailed recommendations.

1. Perform a pre-construction survey and remove all ACM prior to alteration or maintenance work or if ACM may be disturbed by the work.
2. Remove and dispose of mercury-containing items when taken out of service.
3. Follow appropriate safe work procedures when handling or disturbing asbestos, lead, mercury and silica.

Please refer to Section 4.0 of this report for detailed recommendations regarding administrative actions.

*This Executive Summary is subject to the same standard limitations as contained in the report and must be read in conjunction with the entire report.*

## **1.0 INTRODUCTION AND SCOPE**

The City of Toronto (Client) retained Pinchin Ltd. (Pinchin) to conduct a Designated Substances Survey of Toronto Police Services – Drug Squad, located at 160 Duncan Mill Road, Toronto, Ontario.

The survey was performed by Charlotte Spelt, B.A., on December 20, 2017. The surveyor was accompanied by a representative of the Toronto Police Services during the survey. The building was occupied at the time of the survey.

The objective of the survey was to document any changes in condition and quantity of specified Designated Substances, polychlorinated biphenyls (PCBs) and mould identified in the previous Designated Substances Survey (Pinchin File 113698.005), and develop corrective action plans as required. The results of this survey are not to be used for construction, renovation, demolition or project tendering purposes.

### **1.1 Scope of Survey**

For the purpose of the survey and this report, hazardous building materials include the following Designated Substances:

- Asbestos
- Lead
- Silica
- Mercury

The survey also included:

- Polychlorinated Biphenyls (PCBs)
- Mould

The following Ontario Designated Substances are not typically found in building materials in a composition/state that is hazardous and were not included in this survey:

- Arsenic
- Acrylonitrile
- Benzene
- Coke oven emissions
- Ethylene oxide
- Isocyanates
- Vinyl chloride monomer

## 2.0 BACKGROUND INFORMATION

### 2.1 Building Description

Item	Details
Building Use	Police Services
Number of Floors/Levels	2 stories
Total Size of Building	Approximately 22,000 square feet
Year of Construction	1982
Structure	Structural steel, concrete
Exterior Cladding	Pre-cast concrete, masonry
HVAC	Rooftop-AC, forced air heating
Roof	Built-up roofing
Flooring	Vinyl floor tile, vinyl sheeting flooring, carpet, ceramic, rubber
Interior Walls	Drywall, concrete
Ceilings	Drywall, acoustic ceiling tile

## 3.0 FINDINGS

### 3.1 Asbestos

#### 3.1.1 Suspect Building Materials Not Found

The following types of building materials may historically contain asbestos but were not observed in the building and are not discussed in the report findings:

- Spray-applied fireproofing or thermal insulation
- Texture finishes (acoustic/decorative)
- Plaster
- Asbestos cement products

#### 3.1.2 Thermal Systems Insulation (TSI)

##### 3.1.2.1 Pipe Insulation

All pipes observed within the building were either uninsulated or insulated with fibreglass.

### 3.1.2.2 Duct Insulation

Ducts are either uninsulated or insulated with fibreglass and jacketed foil.

### 3.1.2.3 Mechanical Equipment Insulation

Mechanical equipment is not insulated.

### 3.1.3 Acoustic Ceiling Tiles

One type of acoustic ceiling tile is present at various locations in the assessed area. The white, 24" x 48", lay-in, tile with fleck and pinhole pattern (ACT01) was previously determined not to contain asbestos (samples 2015-A0006A-C).

### 3.1.4 Drywall Joint Compound

Drywall (gypsum board) and drywall joint compound is present as a wall and ceiling finish at various locations in the building. Five samples of drywall joint compound were previously collected (samples 2014-A0001A-E) and found to be non-asbestos.

### 3.1.5 Vinyl Sheet Flooring

One type of vinyl sheet flooring is present at various locations in the assessed area. The white vinyl sheet flooring (VSF01) was previously determined not to contain asbestos (samples 2014-A0005A-C).

### 3.1.6 Vinyl Floor Tile and Mastic

Vinyl floor tiles and mastic are present as follows:

Size, Pattern, Colour	Locations	Sample Number	Asbestos Type (tile)	Asbestos Type (mastic)
VFT01, 12" x 12", grey with black and white flecks	*See Survey Form in Appendix IV for locations	2014-A0002A-C	None Detected	None Detected
VFT02, 12" x 12", light grey with brown and white flecks	*See Survey Form in Appendix IV for locations	2014-A0003A-C	None Detected	None Detected
Black mastic	*See Survey Form in Appendix IV for locations	2014-A0004A-C	N/A	None Detected

### 3.1.7 Assumed Asbestos Materials

A number of materials which might contain asbestos were not sampled during our survey due to limitations in scope and methodology. Where present, these materials must be assumed to be an

asbestos material and are best sampled during project planning and preparation of contract documents for their removal. Materials assumed to contain asbestos include:

- Roofing, felts and tar
- Concrete floor levelling compound
- Vermiculite in concrete block wall cavities
- Adhesives and duct mastics
- Caulking
- Fire resistant doors

### **3.2 Lead**

#### *3.2.1 Paints*

No paint samples were collected from the assessed area to avoid causing visible damage to painted finishes. All paints observed were found to be in good condition and not flaking, peeling or delaminating.

#### *3.2.2 Lead Products and Applications*

Lead-containing batteries may be present in emergency lighting.

### **3.3 Silica**

Crystalline silica is assumed component of the following building materials where present in the building:

- Poured or pre-cast concrete
- Masonry and mortar
- Stone (granite, slate)
- Ceramic tiles, grout

### **3.4 Mercury**

#### *3.4.1 Lamps*

Mercury vapour may be present in fluorescent lamps.

#### *3.4.2 Mercury-Containing Devices*

Mercury-containing devices were not found during the survey.

### **3.5 Polychlorinated Biphenyls**

#### **3.5.1 Lighting Ballasts**

Based on visual observations (evidence of T-8 fixtures) the building has been comprehensively re-lamped and will not contain PCB ballasts.

### **3.6 Mould**

Visible mould growth was not found in the assessed area.

## **4.0 RECOMMENDATIONS**

### **4.1 General**

Perform a detailed intrusive survey prior to building renovation or demolition operations. The survey should include; destructive testing (i.e. coring and/or removal of building finishes and components), and sampling of materials not previously tested (i.e. roofing materials, caulking, mastics).

### **4.2 On-going Management and Maintenance**

The following recommendations are made regarding on-going management and maintenance work involving the hazardous materials identified.

#### **4.2.1 Asbestos**

Remove all asbestos-containing materials (ACM) prior to alteration or maintenance work or if ACM may be disturbed by the work. Follow appropriate asbestos precautions for the classification of work being performed.

Update the asbestos inventory report upon completion of any abatement and removal of asbestos-containing materials.

#### **4.2.2 Lead**

Disturbance of lead in paint and coatings (or other materials) during maintenance activities may result in over-exposure to lead dust or fumes. The need for work procedures, engineering controls and personal protective equipment will need to be assessed on a project-by-project basis and must comply with provincial standards or guidelines. Performing an exposure assessment during work that disturbs lead in paints and coatings may be able to alleviate the use of some of the precautions specified by these standards or guidelines.

Lead-containing items should be recycled when taken out of service.

#### 4.2.3 Silica

Disturbance of silica-containing products during maintenance activities may result in excessive exposures to airborne silica, especially if performed indoors and dry. Cutting, grinding, drilling or demolition of materials containing silica should be completed only with proper respiratory protection and other worker safety precautions that comply with provincial standards or guidelines.

#### 4.2.4 Mercury

Recycle and reclaim mercury from fluorescent light tubes when taken out of service. Do not break lamps. Light tubes are accepted free of charge at many local recycling depots.

### 5.0 LIMITATIONS

The work performed by Pinchin was conducted in accordance with the City of Toronto, Blanket Contract #47020968.

### 6.0 REFERENCES

The following legislation and documents were referenced in completing the survey and this report:

**Methodology**

## 1.0 GENERAL

The following survey methodology is based on the requirements of the *Standard Operation Procedure for Designated Substance Surveys*, dated April, 2014, provided by the City of Toronto (the "SOP").

Pinchin conducted a room-by-room survey (rooms, corridors, service areas, exterior, etc.) to identify the hazardous building materials as defined in Section 1.1. Information regarding the approximate quantity, location, and condition of hazardous building materials encountered and visually estimated quantities were recorded on the *Survey Form*, provided by the City of Toronto, found in Appendix V. The locations of any samples collected were recorded on small-scale plans, found in Appendix I.

Drawings (i.e., floor plans), previous reports, and Survey Forms, were referenced where provided.

### 1.1 Limitations on Scope

The survey excludes the following:

- Owner or occupant articles (e.g. stored items, furniture, appliances, etc.);
- Underground materials or equipment (e.g. vessels, drums, underground storage tanks, pipes, etc.);
- Building envelope, structural components, inaccessible or concealed materials or other items where sampling may cause consequential damage to the property.
- Energized systems (e.g. internal boiler components, elevators, mechanical or electrical components);
- Controlled products (e.g. stored chemicals, operational or process-related substances); and
- Materials not typically associated with construction (e.g. settled dust, spills, residual contamination from prior spills, etc.).

The survey was limited to non-intrusive testing. Concealed spaces such as those above solid ceilings and within shafts and pipe chases were accessed via existing access panels only. Pinchin did not conduct demolition of walls, solid ceilings, structural items, interior finishes or exterior building finishes, to determine the presence of concealed materials.

### 1.2 Asbestos

Pinchin conducted an inspection for the presence of friable and non-friable asbestos-containing materials (ACM). A friable material is a material that when dry can be crumbled, pulverized or powdered by hand pressure.

Pinchin collected samples at a rate that is in compliance with Table 1 of O.Reg. 278/05. A separate set of samples was collected of each of homogenous material sampled. A homogenous material is defined by the US EPA<sup>1</sup> as material that is uniform in texture and appearance, was installed at one time, and is unlikely to consist of more than one type or formulation of material. The homogeneous materials are determined by visual examination, available information on the phases of the construction and prior renovations.

The following materials were sampled:

- All friable materials historically known to contain asbestos, regardless of year of installation, not identified in previous reports;
- Friable materials previously sampled in insufficient quantity to conclude the materials are non-asbestos, in accordance with the requirements of O.Reg. 278/05;
- Friable materials previously reported to contain less than 1% asbestos, if sampled prior to the Ministry of Labour defining an asbestos-containing material as a material containing contains 0.5 percent or more asbestos by weight;
- Non-friable acoustic ceiling tiles;
- Non-friable vinyl floor tiles and mastic.

The following materials were **not** sampled:

- Materials previously identified in previous reports provided as asbestos-containing;
- Materials previously confirmed to be non-asbestos in accordance with O.Reg. 278/05;
- Unless damaged the following materials were not sampled: plaster, drywall joint compound, mastic, window caulking, roofing materials, vinyl sheet flooring. Materials not sampled are assumed to contain asbestos.
- Materials where sampling poses an inherent, imminent danger to the Assessor such as high voltage wiring, materials present at heights greater than 12 feet, or those in confined spaces. These materials are assumed to be asbestos-containing.

In some cases, manufactured products such as asbestos cement pipe are visually identified without sample confirmation.

---

<sup>1</sup> Environmental Protection Agency

Pinchin submits the bulk samples to a NVLAP<sup>2</sup> accredited laboratory for analysis. The analysis is performed in accordance with Test Method EPA/600/R-93/116: Method for the Determination of Asbestos in Bulk Building Materials, July 1993.

The asbestos analysis is completed using a stop positive approach. Only one result of greater than the regulated criteria (0.5%) is required to determine that a material is asbestos-containing, but all samples must be analyzed to conclusively determine that a material is non-asbestos. The laboratory stops analyzing samples from a homogeneous material once a result greater than the regulated criteria is detected in any of the samples of that material. All samples of a homogeneous material are analyzed if no asbestos is detected. In some cases, all samples are analyzed in the sample set regardless of result. Where building materials are described in the report as non-asbestos, or described as containing no asbestos, this is subject to the limitations of the analytical method used, and should be understood to mean no asbestos was detected.

Asbestos materials are evaluated in order to make recommendations regarding remedial work. The priority for remedial action is based on several factors:

- friability (friable or non-friable).
- condition (good, fair, poor, debris, based on definitions in the SOP).
- accessibility (ranking from accessible to all building users to inaccessible).
- visibility (whether the material is obscured by other building components).
- efficiency of the work (for example, if damaged ACM is being removed in an area, it may be most practical to remove all ACM in the area even if it is in good condition).

This includes friability, condition and efficiency and practicality of the work.

### 1.3 Lead

Pinchin collected samples of damaged paint not identified in a previous report. Drawings included show sample locations.

Analysis for lead in paints or surface coatings is performed in accordance with EPA Method No. 3050B/Method No. 7420; flame atomic absorption at an accredited laboratory.

For this report, all paints containing lead at a concentration 0.1% or greater are discussed. Paint was evaluated for condition.

Lead building products (e.g. batteries, lead sheeting, flashing) are identified by visual observation only.

---

<sup>2</sup> National Voluntary Laboratory Accreditation Program

#### 1.4 Silica

Pinchin identifies building materials suspected of containing crystalline silica (e.g. concrete, cement, tile, brick, masonry, mortar) by knowledge of current and historic applications and visual inspection only.

Pinchin does not perform sampling of these materials for laboratory analysis of crystalline silica content.

#### 1.5 Mercury

Building materials/products/equipment (e.g. thermostats, barometers, pressure gauges, light tubes), suspected to contain mercury were identified by visual inspection only. Dismantling of equipment suspected of containing mercury was not performed. Sampling of these materials for laboratory analysis of mercury content was not performed.

Mercury spills or damaged mercury-containing equipment was recorded where observed.

#### 1.6 Polychlorinated Biphenyls

Pinchin determines the potential for light ballast and wet transformers to contain PCBs based on the age of the building, a review of maintenance records and examination of labels or nameplates on equipment, where present and accessible. The information is compared to known ban dates of PCBs and Environment Canada publications.

Dry type transformers are assumed to be free of dielectric fluids and hence non-PCB.

Pinchin records spills or leakage of suspect PCB-containing fluids where observed.

Fluids (mineral oil, hydraulic or Askaral) in transformers or other equipment are not sampled for PCB content.

Non-liquid forms of PCBs (i.e. sealants or caulking) are not sampled for PCB content.

#### 1.7 Visible Mould

Pinchin identifies the presence of mould if visibly present in a significant quantity on exposed building surfaces. If any mould growth is concealed within wall cavities it is not addressed in this survey.

## 1.0. EXECUTIVE SUMMARY

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work area(s) for Police Emergency Task Force building located at 300 Lesmill Road, Toronto, Ontario, herein after referred to as the "Site".

The site inspection and sampling works were conducted on March 17, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

### **Asbestos**

Fisher was provided with the report of a previous DSS, which was conducted by Pinchin Environmental Ltd. on December 13, 2017. This report has indicated the only assumed ACM in the building was exterior window caulking.

During the current survey, three (3) bulk samples of building materials found within the specified work area(s) and that could potentially contain asbestos, were collected and submitted to Fisher Environmental Laboratories for Polarised Light Microscopy (PLM) analysis, as outlined in NIOSH Method 9002.

Based on the results of laboratory analysis, black putty present in the door between metal frame and glass was found to contain **0.5-5% Chrysotile** asbestos (approximately 230 LF).

Based on the findings of the survey, Fisher recommendations are as follows:

- Provide a copy of this report to contractors bidding on or performing work within the subject work areas;
- Remove the asbestos-containing black putty, present along the joint of the glass and the door frame, using Type 1 abatement procedures, as outlined in O. Reg. 278/05.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

### **Lead**

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current investigation, no samples were collected for lead analysis.

Fisher recommends that, prior to the planned renovation work, the removal of lead containing materials found within the specified work area(s), must be conducted using the appropriate lead abatement procedures. Lead abatement procedures to be used are determined by the method(s) of disturbance employed. Refer to *MOL Guideline: Lead on Construction Projects*, for details

### **Mercury**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey. Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

### **Silica**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings. If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to *MOL Guideline: Silica on Construction Projects* for details.

### **Other Designated Substances**

The other Designated Substances would not be expected to be present at the Site. No immediate actions were recommended with regard to acrylonitrile, arsenic, benzene, coke oven emissions, ethylene oxide, isocyanates, and vinyl chloride.

### **Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work area(s). No action is recommended with regard to mould.

## 2.0. INTRODUCTION

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work area(s) for Police Emergency Task Force building located at 300 Lesmill Road, Toronto, Ontario, herein after referred to as the "Site".

The site inspection and sampling works were conducted on March 17, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

## 3.0. REGULATIONS

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

The OHSA, R.S.O. 1990, under the Ontario MOL, defines a toxic substance as a biological, chemical or physical agent (or a combination of such agents) whose presence in the workplace may endanger the health and safety of a worker. Sections of the Act that deals with toxic substances are intended to:

1. ensure that worker exposure to toxic substances is controlled;
2. ensure that toxic substances in the workplace are clearly identified and that workers are provided with enough information to be capable of handling them safely; and,
3. provide the general public with access to information about toxic substances used by industry in their communities.

The Act makes provision for a toxic substance to be "designated", where its use in the workplace is prohibited, regulated, restricted, limited or controlled. Designation is reserved for eleven substances that are particularly hazardous, covered under O. Reg 490/09 – *Designated Substances* that was implemented on July 1, 2010, and include Acrylonitrile, Arsenic, Asbestos, Benzene, Coke Oven Emissions, Ethylene Oxides, Isocyanates, Lead, Mercury, Silica, and Vinyl

Chloride. Formerly, regulations for these substances were passed separately and each outlined exposure limits where workers were likely to inhale, ingest and / or absorb the substance.

O. Reg. 490/09 provides a consistent approach to dealing with existing requirements and provisions, and outlines steps required to control worker exposure to these substances, including by inhalation, ingestion, skin absorption or skin contact. Each designated substance has an allowable level of exposure based on a time-weighted average (TWA) limit, and may also have a short-term exposure limit (STEL) and / or ceiling limit (C) assigned to it. TWA refers to the time-weighted average airborne concentration of a biological or chemical agent to which a worker may be exposed in a work day or work week, STEL refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed in any 15 minute period, and C refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed at any time. Refer to O. Reg. 490/09 – *Designated Substances*.

A supplementary regulation regarding control of asbestos exposures in the construction industry has evolved into O. Reg. 278/05 – *Asbestos on Construction Projects and in Buildings and Repair Operations*. The regulation includes a definition of asbestos-containing materials (ACM), requirements for additional training and clearance air testing, procedures for determining materials that meet the definition of ACM and for the use of glove bags, and provisions for varying from measure and procedures set out in the regulation.

In addition to the OHSA and regulations regarding designated substances, the following regulations, guidelines and standards were also taken into account or referenced:

- O. Reg. 213/91 - *Construction Projects* regulated under the OHSA and last amended by O. Reg. 443/09;
- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*;
- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes;
- MOL *Guideline: Lead on Construction Projects*, 2011; and,
- MOL *Guideline: Silica on Construction Projects*, 2011.

#### **4.0. METHODOLOGY**

Fisher followed the protocols outlined in O. Reg. 278/05 for collecting and analyzing bulk samples of materials suspected to contain asbestos. Visual assessment of the material was the primary method of identification with occasional physical contact for the purpose of collecting bulk samples or examining for underlying layers.

Where applicable, samples of suspect materials were collected in order to establish asbestos or lead content. Samples were grouped according to similarity of appearance (“homogeneous”

materials). The frequency at which the samples were collected was sufficient to obtain a general representation of the presence of these materials at the Site. Samples collected are presumed to be representative of respective building materials in-place at the Site. However, due to potential past renovations, alterations, repairs, or phases of construction, it is possible that individual materials may not be representative of samples collected.

Sampling of roofing materials was not part of the current scope of work. Further, sampling of materials found within operating equipment, portable building articles, or generally non-accessible components such as insulation within electrical switch gears, wiring, motors, light fixtures, elevator brakes, fire door cores, etc. was not performed as part of the current survey.

Samples collected during the survey were placed in plastic zip-lock bags which were labeled and submitted for laboratory analysis. Fisher Environmental Laboratories analysed bulk samples for asbestos type and approximate percent content by performing polarized light microscopy (PLM), as outlined in NIOSH Method 9002. Fisher Environmental Laboratories analysed samples for lead content in paint by performing acid digestion followed by Inductively Coupled Plasma (ICP) analysis.

Site Plan(s), indicating specific work area(s), bulk sample locations and any area(s) of asbestos, are included in Appendix A. The laboratory certificate(s) of analysis are included in Appendix B. Representative photos of Site conditions encountered at the time of the current survey are included in Appendix C.

## **5.0. REVIEW OF PREVIOUS REPORTS**

Fisher was provided with the report of a previous DSS, which was conducted by Pinchin Environmental Ltd. on December 13, 2017, attached in Appendix D. This report has indicated the only assumed ACM in the building was exterior window caulking.

## **6.0. FINDINGS AND RECOMMENDATIONS**

### **6.1. *Acrylonitrile***

Acrylonitrile would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Acrylonitrile are warranted at this time.

### **6.2. *Arsenic***

Arsenic would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Arsenic are warranted at this time.

## **6.3. Asbestos**

### **6.3.1. General Information**

Asbestos is the name given to a group of six different fibrous minerals (amosite, chrysotile, crocidolite, and the fibrous varieties of tremolite, actinolite and anthophyllite) that occur naturally in the environment. Asbestos minerals have separable long fibres that are strong and flexible enough to be spun and woven and are heat resistant.

Because of these characteristics, asbestos has been used for a wide range of manufactured goods, mostly in building materials (roofing shingles, ceiling and floor tiles, paper products, and asbestos cement products), friction products (automobile clutch, brake, and transmission parts), heat-resistant fabrics, packaging, gaskets, and coatings. Some vermiculite or talc products may also contain asbestos.

Asbestos fibres may be released into the air by the disturbance of ACM during product use, renovation or demolition work, building or home maintenance, repair and remodeling. In general, exposure may occur only when the ACM is disturbed in some way to release particles and fibres into the air.

### **6.3.2. Friable vs. Non-Friable ACM**

Based on the requirements of O. Reg. 278/05 and due diligence, an asbestos survey and report must be available at any workplace where asbestos exists identifying locations and types of ACM in the building. The survey must include both friable and non-friable materials confirmed to contain asbestos, as well as any other materials which were not sampled but are suspected (presumed) ACM. The term friable refers to material(s) that could be readily reduced to dust or powder when crushed by hand or moderate pressure. Friable materials have a much greater chance of releasing airborne asbestos fibres when disturbed.

In the past, the most commonly used friable asbestos-containing building materials were surfacing materials (e.g. sprayed on fireproofing, texture, decorative or acoustic plaster) as well as thermal insulation. Examples of manufactured asbestos-containing materials include vinyl floor tiles, ceiling tiles, gasket materials, asbestos cement (transite) pipes or boards, and asbestos textiles. Depending on the above noted formulation, these materials range from non-friable to friable. Although some products are considered non-friable when in Good condition, severe damage or deterioration may cause non-friable materials to generate airborne dust more readily. Severely damaged non-friable materials, or those to be worked on with powered tools, may be considered as friable ACM for abatement purposes.

Examples of common types of ACM by friability include:

- Friable ACM

- Sprayed Materials (or materials installed by roller or trowel), such as fireproofing, thermal insulation, texture finishes, etc.
  - Mechanical Insulation such as boiler and breeching, ductwork, piping, tanks and associated equipment.
  - Plaster
- Potentially Friable ACM
  - Acoustic Ceiling Tiles
  - Vinyl Sheet Flooring
- Non-Friable ACM
  - Vinyl Floor Tiles
  - Asbestos cement (“transite”) piping or paneling
  - Window Caulking

### 6.3.3. Regulations

Exposure to asbestos is controlled by two Regulations passed under Ontario’s Occupational Health and Safety Act (OHSA), R.R.O. 1990.

- O. Reg. 490/09 – *Designated Substances* regarding asbestos applies to:
  - every employer operating a mine for the purpose of mining, crushing, grinding or sifting asbestos;
  - every employer processing, adapting or using asbestos in connection with manufacturing or assembling of goods or products;
  - every employer engaged in the repair, alteration or maintenance of machinery, equipment, aircraft, ships, locomotives, railway cars and vehicles;
  - every employer engaged in work on a building that is necessarily incidental to the repair, alteration or maintenance of machinery or equipment; and,
  - to those workers of such employers who are likely to be exposed to asbestos.

Exposure limits for this substance are set at 0.1 f/cc (TWA) for all types of asbestos.

- O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* applies to buildings that contain friable and non-friable ACM and to the repair, alteration and/or maintenance of these buildings.

In addition to regulations for controlling work around asbestos-containing building materials there are regulations for packaging, transportation and disposal of asbestos-containing waste:

- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*; and,

- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes.

#### **6.3.4. Findings**

Samples of homogenous materials suspected to contain asbestos were collected and submitted for analysis. Fisher collected three (3) bulk samples of building materials found within the specified work area(s) and that could potentially contain asbestos. Findings of all building materials identified within the specified work area(s) are outlined in further detail below.

##### **6.3.4.1. Sprayed or Troweled Fireproofing and Thermal Insulation**

No indication of sprayed or troweled fireproofing and / or thermal insulation was noted in any of the specified work area(s) during the current survey.

##### **6.3.4.2. Texture Finish**

No texture finish was noted in any of the specified work area(s) during the current survey.

##### **6.3.4.3. Mechanical Insulation**

The majority of mechanical insulation observed throughout the building are either not insulated or are insulated with fiberglass which is not suspected to contain asbestos.

##### **6.3.4.4. Acoustic Ceiling Tile**

During the current survey, one (1) visually distinct style of ceiling tile was observed within the specified work areas.

- Ceiling Tile 1 (2' x 4' Random Pinholes).

The previous report confirmed that Ceiling Tile 1 was sampled for analysis. The results of analysis revealed this style of ceiling tile does not contain asbestos.

##### **6.3.4.5. Plaster / Drywall Joint Compound**

Plaster was not observed within the specified work areas during the survey. Drywall Joint Compound (DJC) was observed in the building. The previous report indicated that DJC was sampled for analysis. The results of analysis revealed that the DJC does not contain asbestos.

##### **6.3.4.6. Asbestos Cement Products**

No asbestos cement products, such as Transite pipe or board, were noted in any of the specified work area(s) during the current survey.

##### **6.3.4.7. Vinyl Sheet Flooring**

No vinyl sheet flooring was noted in any of the specified work area(s) during the current survey.

#### 6.3.4.8. Vinyl Floor Tile

During the current survey, one (1) variety of vinyl floor tile was observed within the specified work area(s).

- Vinyl Floor Tile 1 – 12" x 12", Blue with Streaks

The previous report confirmed that Vinyl Floor Tile 1 was sampled for analysis. The results of analysis revealed this variety of vinyl floor tile does not contain asbestos.

#### 6.3.4.9. Other ACM

##### Black Putty

Black Putty was observed in the doors between metal frame and glass. Three (3) samples of the black putty were collected for analysis. The results of analysis revealed that the black putty contains **0.5-5% Chrysotile** asbestos (approximately 230 LF).

##### Various Caulking

Brown caulking was observed in the washroom around the sink, white caulking was observed in the kitchenette and in the coffee room, and transparent caulking was observed in the coffee room. These materials were made of silicone and do not contain asbestos.

#### 6.3.5. Recommendations

Prior to demolition or any renovation activities, all asbestos-containing materials must be removed from the specified work area(s) in accordance with O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations*, and be disposed of at MOE licensed landfill in accordance with O. Reg. 558/00 (amending O. Reg. 347, *General – Waste Management*).

Refer to attached Site Plans in Appendix A, which illustrate where the ACM is located within the specified work area(s).

Specifically, Fisher recommends the following:

- Provide a copy of this report to contractors bidding on or performing work within the subject work areas;
- Remove the asbestos-containing black putty along the joint of the glass and the door frame using Type 1 abatement procedures, as outlined in O. Reg. 278/05.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

The presence of ACM should be presumed in locations not accessed during this survey. It is possible that ACM is present at the Site that is not identified in this report. Should additional suspected ACM be discovered, it should be presumed as ACM until sample analysis determines asbestos content.

Due to the limited nature of the current scope of work and the presence of solid building finishes (i.e. plaster or drywall walls and ceilings etc.) in many locations, the full extent of ACM may not be confirmed. Precautions should be taken when dismantling solid wall or ceiling finishes, or any other building surfaces which may conceal potential ACM. Such precautions include, but are not limited to, isolation measures and appropriate personal protective equipment.

#### **6.4. Benzene**

Benzene would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Benzene are warranted at this time.

#### **6.5. Coke Oven Emissions**

Coke oven emissions would not be expected to be present at the Site and were not observed during the current survey. No recommendations for coke oven emissions are warranted at this time.

#### **6.6. Ethylene Oxides**

Ethylene oxides would not be expected to be present at the Site and were not observed during the current survey. No recommendations for ethylene oxides are warranted at this time.

#### **6.7. Isocyanates**

Isocyanates would not be expected to be present at the Site and were not observed during the current survey. No recommendations for isocyanates are warranted at this time.

#### **6.8. Lead**

##### **6.8.1. General Information**

Lead is a naturally occurring bluish-gray metal found in small amounts in the earth's crust. Most lead in the environment comes from human activities such as burning fossil fuels, mining and manufacturing. Lead is used in the production of batteries, ammunition, metal products (solder and pipes) and X-ray devices.

Lead does not break down but lead compounds are changed by sunlight, air and water. Exposure occurs when eating food or drinking water that contains lead. Deteriorated lead paint can contribute to lead dust. The main target for lead toxicity is the nervous system.

### 6.8.2. Regulations and Guidelines

The Ontario MOL has not prescribed criteria defining an analyzed sample of bulk material as “lead-containing”. Further, the MOL has not established a lower limit for concentrations of lead in paint, below which precautions do not need to be considered during construction projects. However, except for very aggressive disturbance of painted finishes, (e.g., abrasive blasting, torch cutting, or grinding), Fisher believes that a lead content below 0.1% by weight (1,000 ug/g or 1000 ppm) represents a concentration in which the lead content is not the limiting hazard for construction hygiene purposes. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations.

The regulation for the designated substance lead applies to every employer and worker at a workplace where lead is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to lead. Exposure limits for this substance are set at 0.05 – 0.10 mg/m<sup>3</sup> (TWA) depending on the type of lead, and for tetraethyl lead 0.30 mg/m<sup>3</sup> (STEL).

Additionally, in 2011 the MOL revised *Guideline: Lead on Construction Projects* outlining practices that should be followed during construction projects to protect workers from exposure to lead. This includes the methods and equipment employed in the removal of lead-containing coatings that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### 6.8.3. Findings

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current investigation, no samples were collected for lead analysis.

### 6.8.4. Recommendations

Where any lead-containing materials may be disturbed or removed, Fisher recommends that appropriate lead abatement procedures be used. The lead abatement procedures to be used are determined by the method(s) of disturbance employed. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations. The table below outlines lead abatement operations and associated respirator required, as outlined in Ontario MOL guidelines.

#### Classifications of Lead-Containing Operations and Required Respirator

<b>Type 1 Operations</b> (where concentrations of airborne lead would be expected to be < 0.05 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Removal of lead containing coatings with chemical gel or paste and fibrous laminated cloth wrap</li> </ul>	Respirators should not be necessary if general procedures are followed and level of air is less than 0.05 mg/m <sup>3</sup> . However, if

<ul style="list-style-type: none"> <li>Removal of lead containing coatings / materials using power tool that has an effective dust collection system equipped with HEPA filter</li> <li>Removal of lead containing coatings / materials using non-powered hand tools other than manual scraping or sanding</li> </ul>	worker wishes to use a respirator, a half-mask particulate respirator with N-, R- or P-series filter, and 95, 99 or 100% efficiency should be provided.
<b>Type 2a Operations</b> (where concentrations of airborne lead would be expected to be > 0.05 to 0.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>Removal of lead containing coatings / materials by scraping or sanding using non-powered hand tools</li> <li>Manual demolition of lead painted plaster walls / building components by striking with a sledgehammer or similar tool</li> </ul>	NIOSH APF = 10 Half-mask particulate respirator with N-, R- or P- series filter, and 95, 99 or 100% efficiency.
<b>Type 2b Operations</b> (where concentrations of airborne lead would be expected to be > 0.50 to 1.25 mg/m <sup>3</sup> )	
Not applicable to potential renovation activities.	
<b>Type 3a Operations</b> (where concentrations of airborne lead would be expected to be > 1.25 to 2.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>Welding or high temperature cutting of lead-containing coatings or materials indoors or in a confined space.</li> <li>Dry removal of lead-containing mortar using an electronic or pneumatic cutting device.</li> <li>Burning of a surface containing lead</li> <li>Removal of lead containing coatings / materials using power tools without an effective dust collection system equipped with HEPA filter</li> </ul>	NIOSH APF = 50  Full-face piece air-purifying respirator with N-, R- or P- series filter and 100% efficiency.  Tight-fitting powered air-purifying respirator with high efficiency filter.  Full-face piece supplied-air respirator operated in demand mode.  Half-mask or full-face piece supplied air respirator operated in continuous-flow mode.
<b>Type 3b Operations</b> (where concentrations of airborne lead would be expected to be > 2.50 mg/m <sup>3</sup> )	
Abrasive blasting of lead-containing coatings or materials.	NIOSH APF ≥1000  Type CE abrasive-blast supplied respirator operated in a positive pressure mode with a tight-fitting half-mask face piece.

Refer to MOL *Guideline: Lead on Construction Projects, 2011*, for details of the Ministry's health and safety guidelines regarding lead.

## 6.9. Mercury

### 6.9.1. General Information

Mercury is a naturally occurring metal. It is a shiny, silver-white and odourless liquid. It combines with other elements to form inorganic compounds or salts. Metallic mercury is used to produce chlorine gas and caustic soda, and is used in thermostats and thermometers, fluorescent light bulbs, dental fillings and batteries. Exposure occurs when eating fish or shellfish contaminated with methyl mercury, breathing vapors from spills, incinerators, etc.

The nervous system is very sensitive to all forms of mercury. Exposure to high levels of metallic inorganic or organic mercury can permanently damage the brain, kidneys and developing fetus. Short-term exposure may cause lung damage, nausea, vomiting and diarrhea as well as skin and eye irritation.

### **6.9.2. Regulations**

The regulation for mercury applies to every employer and worker at a workplace where mercury is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to mercury. Exposure limits for this substance are set at 0.025 – 0.01 mg/m<sup>3</sup> (TWA) for all forms of mercury excluding alkyl, and for alkyl compounds of mercury 0.03 mg/m<sup>3</sup> (STEL).

### **6.9.3. Findings**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey.

### **6.9.4. Recommendations**

Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

## **6.10. Silica**

### **6.10.1. General Information**

Silica is a crystalline compound occurring abundantly as quartz, sand, and many other minerals, and used to manufacture a variety of materials, especially glass and concrete. When mining this substance, silica can be deadly when it becomes airborne. If inhaled, silica dust can cause silicosis which can be fatal.

Some of the following industries have a high potential for risk to workers: construction (sandblasting, rock drilling, masonry work, jack hammering, tunneling), mining (cutting or drilling through sandstone or granite), foundry work (grinding, mouldings, shakeout, core room), stone cutting (sawing, abrasive blasting, chipping, grinding), manufacturing and use of abrasives, etc.

### **6.10.2. Regulations**

The regulation for silica applies to every employer and worker at a workplace where silica is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to silica. Exposure limits for this substance are set at 0.05 - 0.10 mg/m<sup>3</sup> (TWA), depending on the type of silica.

Additionally, in 2011 the MOL revised *Guideline: Silica on Construction Projects* outlining practices that should be followed during construction projects to protect workers from exposure to silica. This includes the methods and equipment employed in the removal of silica-containing materials that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **6.10.3. Findings**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings.

### **6.10.4. Recommendations**

If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to MOL *Guideline: Silica on Construction Projects* for details.

### **6.11. Vinyl Chloride**

Vinyl chloride would not be expected to be present at the Site and was not observed during the current survey. No recommendations for vinyl chloride are warranted at this time.

### **6.12. Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work area(s). No action is recommended with regard to mould.

## 7.0. LIMITATIONS

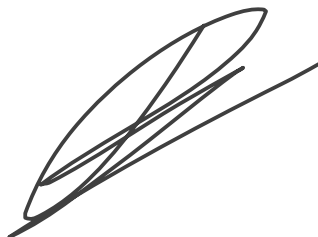

Fisher Environmental Ltd. accepts responsibility for the competent performance of its duties in executing this assignment within the normal standards of the profession, but disclaims responsibility for consequential damages, if any.

The scope of the survey is based on prior agreement with the client, and the rationale given in this report. The survey findings rely on professional interpretation of selective sampling and analysis. Sample analysis results have been applied to homogenous materials in unsampled locations; it was not within the scope of work to carry out an exhaustive sampling and analysis program. For non-accessible building spaces, the likelihood of the presence or absence of asbestos and other designated substances has been described, but such assessment is not a definitive statement of presence or absence.

This report was prepared for the IBI Group. The scope of services performed may not be appropriate for the purposes of other users, and any use or reuse of this document or its findings or recommendations represented herein is at the sole risk of any other user.

We trust that the information provided in the report meets your current requirements. If you have any questions or concerns, please do not hesitate to contact the undersigned.

Respectfully submitted,

Renata Stec, M.Sc.  
Project Manager

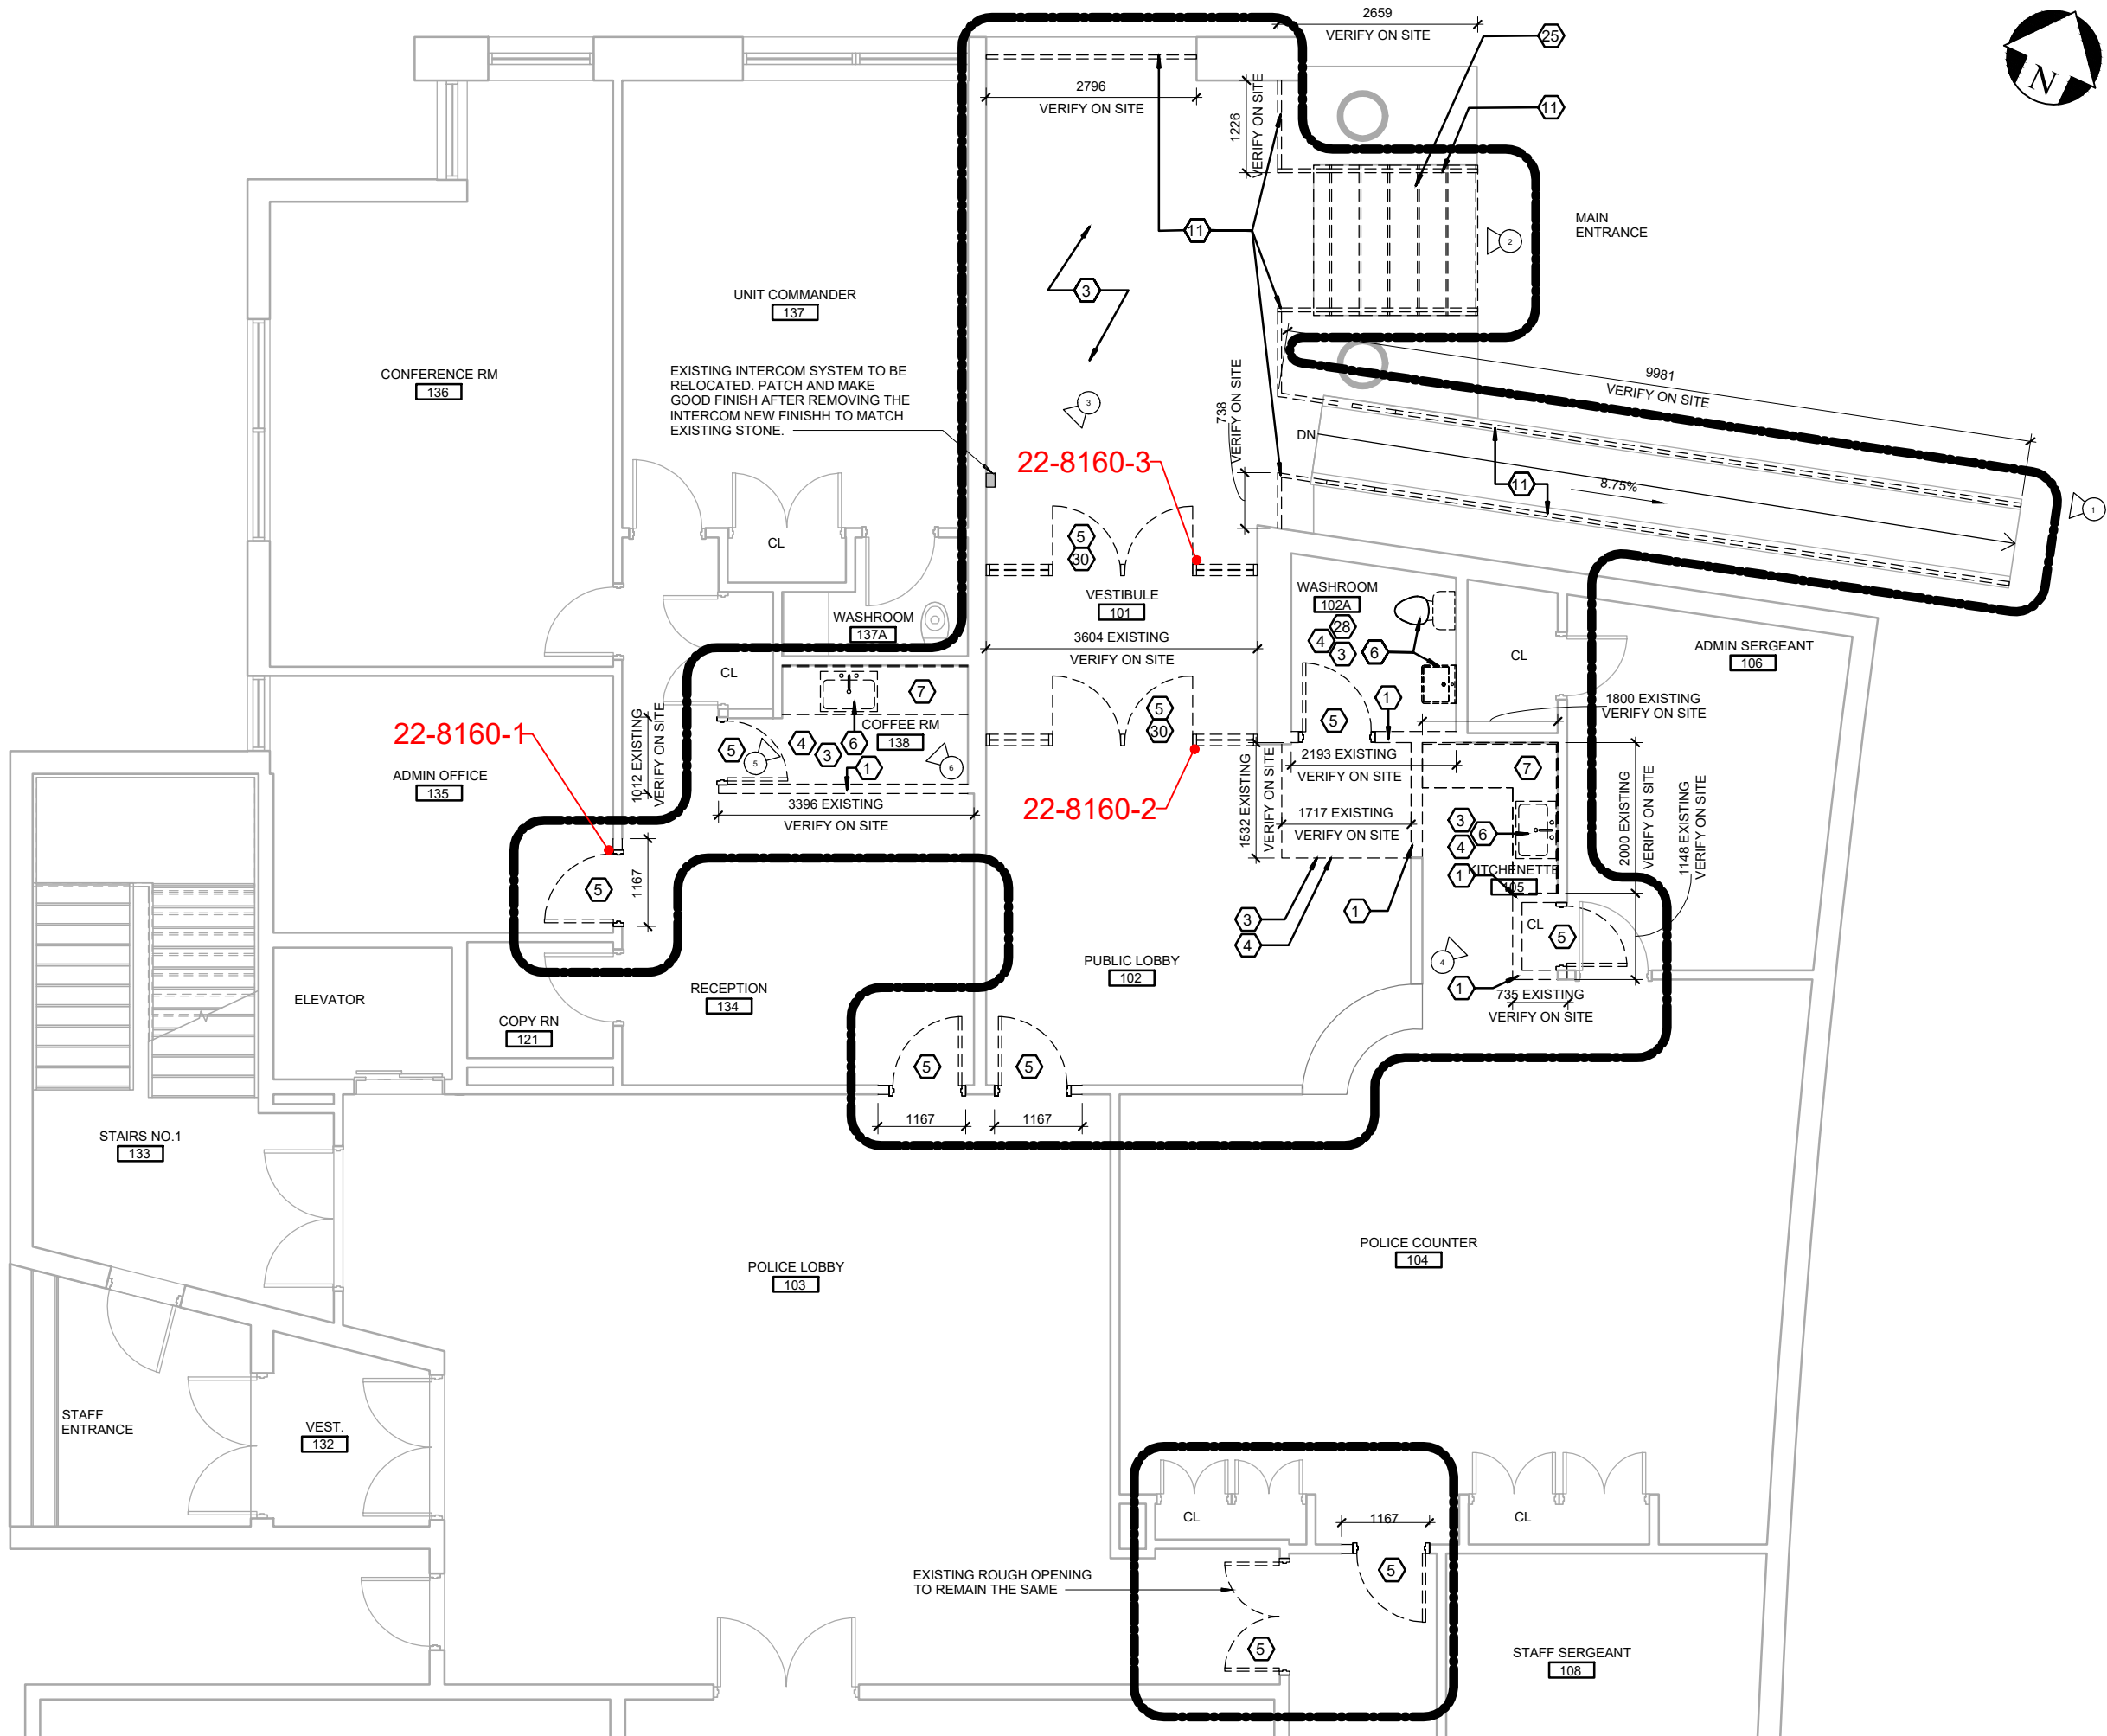

David Fisher, P. Eng., C. Chem.  
Principal

## EXECUTIVE SUMMARY

The City of Toronto (Client) retained Pinchin Ltd. (Pinchin) to conduct a Designated Substance survey of Toronto Police Services – Emergency Task Force, located at 300 Lesmill Road, Toronto, Ontario. The survey was performed on December 13, 2017.

The objective of the survey was to document any changes in condition and quantity of specified Designated Substances, polychlorinated biphenyls (PCBs) and mould identified in the previous Designated Substances Survey (Pinchin File 113698.005), and develop corrective action plans as required. The results of this survey are not intended for construction, renovation, demolition or project tendering purposes.

The assessed area consisted of the entire building. The building was occupied at the time of the survey.

## SUMMARY OF FINDINGS

Asbestos: Asbestos-containing materials (ACM) were assumed to be present as follows:

- Roofing materials.
- Exterior window caulking.

Lead: Lead was confirmed to be present in select paints. Lead may be present in emergency light batteries.

Silica: Crystalline silica is present in concrete, mortar, brick, masonry, ceramics and asphalt.

Mercury: Mercury vapour may be present in fluorescent.

Polychlorinated Biphenyls (PCBs): PCB-containing materials were not confirmed.

Mould: Mould-impacted materials were not observed.

## SUMMARY OF RECOMMENDATIONS

The following is a summary of significant recommendations; refer to the body of the report for detailed recommendations.

1. Perform a pre-construction survey and remove all ACM prior to alteration or maintenance work or if ACM may be disturbed by the work.
2. Remove and dispose of mercury-containing items when taken out of service.
3. Follow appropriate safe work procedures when handling or disturbing asbestos, lead, mercury and silica.

Please refer to Section 4.0 of this report for detailed recommendations regarding administrative actions.

*This Executive Summary is subject to the same standard limitations as contained in the report and must be read in conjunction with the entire report.*

APPENDIX IV	Survey Form

## **1.0 INTRODUCTION AND SCOPE**

The City of Toronto (Client) retained Pinchin Ltd. (Pinchin) to conduct a Designated Substances Survey of Toronto Police Services – Emergency Task Force, located at 300 Lesmill Road, Toronto, Ontario.

The survey was performed by Charlotte Spelt, B.A., on December 13, 2017. The surveyor was accompanied by a site representative during the survey. The building was occupied at the time of the survey.

The objective of the survey was to document any changes in condition and quantity of specified Designated Substances, polychlorinated biphenyls (PCBs) and mould identified in the previous Designated Substances Survey (Pinchin File 113698.005), and develop corrective action plans as required. The results of this survey are not to be used for construction, renovation, demolition or project tendering purposes.

### **1.1 Scope of Survey**

For the purpose of the survey and this report, hazardous building materials include the following Designated Substances:

- Asbestos
- Lead
- Silica
- Mercury

The survey also included:

- Polychlorinated Biphenyls (PCBs)
- Mould

The following Ontario Designated Substances are not typically found in building materials in a composition/state that is hazardous and were not included in this survey:

- Arsenic
- Acrylonitrile
- Benzene
- Coke oven emissions
- Ethylene oxide
- Isocyanates
- Vinyl chloride monomer

## 2.0 BACKGROUND INFORMATION

### 2.1 Building Description

Item	Details
Building Use	Police Services
Number of Floors/Levels	Two stories plus one below grade
Total Size of Building	Approximately 35,000 square feet
Year of Construction	1989
Structure	Structural steel, concrete
Exterior Cladding	Pre-cast concrete, metal
HVAC	Rooftop units
Roof	Built-up roofing, metal roofing
Flooring	Vinyl floor tile, concrete, ceramic tile, carpet, rubber
Interior Walls	Drywall, concrete, steel
Ceilings	Drywall, plaster, acoustic ceiling tile

### 2.2 Inaccessible Locations

The following rooms or areas of the building were not accessible to the surveyor and are therefore not included in the report:

Area or Room	Reason
Training Storage (Location B-03)	No access, locked
Unknown Room (Location B-04)	No access, locked
Training Storage (Location B-05)	No access, locked
Waiting Room (Location B-10)	No access, locked
Storage Rooms (Locations B-16 and B-19)	No access, locked

### 3.0 FINDINGS

#### 3.1 Asbestos

##### 3.1.1 Suspect Building Materials Not Found

The following types of building materials may historically contain asbestos but were not observed in the building and are not discussed in the report findings:

- Spray-applied fireproofing or thermal insulation
- Texture finishes (acoustic/decorative)
- Asbestos cement products
- Vinyl sheet flooring

##### 3.1.2 Thermal Systems Insulation (TSI)

###### 3.1.2.1 Pipe Insulation

Pipes either uninsulated or insulated with fibreglass.

###### 3.1.2.2 Duct Insulation

Ducts are either uninsulated or insulated with fibreglass and jacketed with canvas or foil.

###### 3.1.2.3 Mechanical Equipment Insulation

Mechanical equipment is ether uninsulated or insulated with fibreglass

##### 3.1.3 Acoustic Ceiling Tiles

Three distinct types of acoustic ceiling tile are present in the assessed area, as follows:

Size, Type and Pattern	Locations	Sample Number	Asbestos Type
ACT01, 24" x 48", lay-in random pinhole pattern	*See Survey Form in Appendix IV for locations	2014-A0004A-C	None Detected
ACT02, 24" x 48", lay-in fleck and pinhole pattern	*See Survey Form in Appendix IV for locations	2014-A0008A-C	None Detected
ACT03, 24" x 48", lay-in square pattern	*See Survey Form in Appendix IV for locations	2014-A0005A-C	None Detected

### 3.1.4 Plaster

Plaster is present as a ceiling finish in the Men's Locker Room (Location 2-19). Three samples of plaster were collected (samples 2017-A0001-A-C) and determined not to contain asbestos.

### 3.1.5 Drywall Joint Compound

Drywall (gypsum board) and drywall joint compound is present as a wall and ceiling finish at various locations the building. Six samples of drywall joint compound were previously collected and determined not to contain asbestos (samples 2014-A0002A-C and 2014-A0003A-C).

### 3.1.6 Vinyl Floor Tile and Mastic

Vinyl floor tiles and mastic are present as follows:

Size, Pattern and Colour	Locations	Sample Number	Asbestos Type (tile)	Asbestos Type (mastic)
VFT01, 12" x 12", blue with white streaks	*See Survey Form in Appendix IV for locations	2014-A0001A-C	None Detected	None Detected
VFT02, 12" x 12", blue with blue flecks	*See Survey Form in Appendix IV for locations	2014-A0006A-C	None Detected	None Detected

### 3.1.7 Assumed Asbestos Materials

A number of materials which might contain asbestos were not sampled during our survey due to limitations in scope and methodology. Where present, these materials must be assumed to be an asbestos material and are best sampled during project planning and preparation of contract documents for their removal. Materials assumed to contain asbestos include:

- Roofing, felts and tar
- Concrete floor levelling compound
- Elevator and lift brakes
- Vermiculite in concrete block wall cavities
- Adhesives and duct mastics
- Caulking
- Fire resistant doors

## **3.2 Lead**

### *3.2.1 Paints*

Orange paint was previously sampled from the metal ducts in the Mechanical Room (Location B-01) and determined to contain 0.022% lead (sample 2015-L001), below the City of Toronto action limit of 0.1%.

All other paints were observed in good condition (i.e. not flaking, peeling or delaminating).

### *3.2.2 Lead Products and Applications*

Lead-containing batteries may be present in emergency lighting.

## **3.3 Silica**

Crystalline silica is assumed component of the following building materials where present in the building:

- Poured or pre-cast concrete
- Masonry and mortar
- Ceramic tiles, grout
- Plaster

## **3.4 Mercury**

### *3.4.1 Lamps*

Mercury vapour may be present in fluorescent lamps.

### *3.4.2 Mercury-Containing Devices*

Mercury-containing devices were not found during the survey.

## **3.5 Polychlorinated Biphenyls**

### *3.5.1 Lighting Ballasts*

Based on visual observations (evidence of T-8 fixtures) the building has been comprehensively re-lamped and will not contain PCB ballasts.

## **3.6 Mould**

Visible mould growth was not found in the assessed area.

## **4.0 RECOMMENDATIONS**

### **4.1 General**

Perform a detailed intrusive survey prior to building renovation or demolition operations. The survey should include; destructive testing (i.e. coring and/or removal of building finishes and components), and sampling of materials not previously tested (i.e. roofing materials, caulking, mastics).

### **4.2 On-going Management and Maintenance**

The following recommendations are made regarding on-going management and maintenance work involving the hazardous materials identified.

#### *4.2.1 Asbestos*

Remove all asbestos-containing materials (ACM) prior to alteration or maintenance work or if ACM may be disturbed by the work. Follow appropriate asbestos precautions for the classification of work being performed.

Update the asbestos inventory report upon completion of any abatement and removal of asbestos-containing materials.

#### *4.2.2 Lead*

Disturbance of lead in paint and coatings (or other materials) during maintenance activities may result in over-exposure to lead dust or fumes. The need for work procedures, engineering controls and personal protective equipment will need to be assessed on a project-by-project basis and must comply with provincial standards or guidelines. Performing an exposure assessment during work that disturbs lead in paints and coatings may be able to alleviate the use of some of the precautions specified by these standards or guidelines.

Lead-containing items should be recycled when taken out of service.

#### *4.2.3 Silica*

Disturbance of silica-containing products during maintenance activities may result in excessive exposures to airborne silica, especially if performed indoors and dry. Cutting, grinding, drilling or demolition of materials containing silica should be completed only with proper respiratory protection and other worker safety precautions that comply with provincial standards or guidelines.

#### *4.2.4 Mercury*

Recycle and reclaim mercury from fluorescent light tubes when taken out of service. Do not break lamps. Light tubes are accepted free of charge at many local recycling depots.

## 5.0 LIMITATIONS

The work performed by Pinchin was conducted in accordance with the City of Toronto, Blanket Contract #47020968.

## 6.0 REFERENCES

The following legislation and documents were referenced in completing the survey and this report:

1. Asbestos on Construction Projects and in Buildings and Repair Operations, Ontario Regulation 278/05.
2. Designated Substances, Ontario Regulation 490/09.
3. Lead on Construction Projects, Ministry of Labour Guidance Document.
4. Ministry of the Environment Regulation, R.R.O. 1990 Reg. 347 as amended.

## Pinchin Ltd. Asbestos Laboratory Certificate of Analysis

Project Name:	City of Toronto, 300 Lesmill Road, Toronto, Ontario		
Project No.:	0202779.000		
Prepared For:	C. Spelt / A. Quinn	Date Received:	December 15, 2017
Lab Reference No.:	b181971	Date Analyzed:	December 27, 2017
Analyst(s):	C. Luong	# Samples submitted:	3
		# Phases analyzed:	9

### Method of Analysis:

**EPA 600/R-93/116 - Method for the Determination of Asbestos in Bulk Building Materials dated July, 1993**

Bulk samples are checked visually and scanned under a stereomicroscope. Slides are prepared and observed under a Polarized Light Microscope (PLM) at magnifications of 40X, 100X or 400X as appropriate. Asbestos fibres are identified by a combination of morphology, colour, refractive index, extinction, sign of elongation, birefringence and dispersion staining colours. A visual estimate is made of the percentage of asbestos present. A reported concentration of less than (<) the regulatory threshold (see chart below) indicates the presence of confirmed asbestos in trace quantities, limited to only a few fibres or fibre bundles in an entire sample. This method complies with provincial regulatory requirements where applicable. Multiple phases within a sample are analyzed and reported separately.

Provincial Jurisdiction	Regulatory Threshold	Provincial Jurisdiction	Regulatory Threshold
Ontario, British Columbia, Nova Scotia	0.5%	Manitoba	0.1% friable 1% non-friable
Quebec	0.1%	Saskatchewan	0.5% friable 1% non-friable
Alberta, NWT, Yukon, Nunavut	1%	Newfoundland and Labrador, PEI and New Brunswick	1%

All bulk samples submitted to this laboratory for asbestos analysis are retained for a minimum of three months. Samples may be retrieved, upon request, for re-examination at any time during that period.

Pinchin Ltd. is accredited by the National Institute of Standards and Technology, National Voluntary Laboratory Accreditation Program (NVLAP Lab Code 101270-0) for the 'EPA-600/M4-82-020: Interim Method for the Determination of Asbestos in Bulk Insulation Samples,' and the 'EPA 600/R-93/116: Method for the Determination of Asbestos in Bulk Building Materials'; and meets all requirements of ISO/IEC 17025:2005.

This report relates only to the items tested.

**NOTE:** *This test report may not be reproduced, except in full, without the written approval of the laboratory. The client may not use this report to claim product endorsement by NVLAP or any agency of the U.S. Government. This report is valid only when signed in blue ink by the analyst. Vinyl asbestos floor tiles contain very fine fibres of asbestos and may be missed by some laboratories using the PLM method. Internal verification studies performed by Pinchin indicate that the chance of missing asbestos in floor tiles is no higher than about 2%. The vinyl tile study and laboratory documentation on measurement uncertainty is available upon request. The analysis of dust samples by PLM cannot be used as an indicator of past or present airborne asbestos fibre levels.*

**Methodology**

## 1.0 GENERAL

The following survey methodology is based on the requirements of the *Standard Operation Procedure for Designated Substance Surveys*, dated April, 2014, provided by the City of Toronto (the "SOP").

Pinchin conducted a room-by-room survey (rooms, corridors, service areas, exterior, etc.) to identify the hazardous building materials as defined in Section 1.1. Information regarding the approximate quantity, location, and condition of hazardous building materials encountered and visually estimated quantities were recorded on the *Survey Form*, provided by the City of Toronto, found in Appendix V. The locations of any samples collected were recorded on small-scale plans, found in Appendix I.

Drawings (i.e., floor plans), previous reports, and Survey Forms, were referenced where provided.

### 1.1 Limitations on Scope

The survey excludes the following:

- Owner or occupant articles (e.g. stored items, furniture, appliances, etc.);
- Underground materials or equipment (e.g. vessels, drums, underground storage tanks, pipes, etc.);
- Building envelope, structural components, inaccessible or concealed materials or other items where sampling may cause consequential damage to the property.
- Energized systems (e.g. internal boiler components, elevators, mechanical or electrical components);
- Controlled products (e.g. stored chemicals, operational or process-related substances); and
- Materials not typically associated with construction (e.g. settled dust, spills, residual contamination from prior spills, etc.).

The survey was limited to non-intrusive testing. Concealed spaces such as those above solid ceilings and within shafts and pipe chases were accessed via existing access panels only. Pinchin did not conduct demolition of walls, solid ceilings, structural items, interior finishes or exterior building finishes, to determine the presence of concealed materials.

### 1.2 Asbestos

Pinchin conducted an inspection for the presence of friable and non-friable asbestos-containing materials (ACM). A friable material is a material that when dry can be crumbled, pulverized or powdered by hand pressure.

Pinchin collected samples at a rate that is in compliance with Table 1 of O.Reg. 278/05. A separate set of samples was collected of each of homogenous material sampled. A homogenous material is defined by the US EPA<sup>1</sup> as material that is uniform in texture and appearance, was installed at one time, and is unlikely to consist of more than one type or formulation of material. The homogeneous materials are determined by visual examination, available information on the phases of the construction and prior renovations.

The following materials were sampled:

- All friable materials historically known to contain asbestos, regardless of year of installation, not identified in previous reports;
- Friable materials previously sampled in insufficient quantity to conclude the materials are non-asbestos, in accordance with the requirements of O.Reg. 278/05;
- Friable materials previously reported to contain less than 1% asbestos, if sampled prior to the Ministry of Labour defining an asbestos-containing material as a material containing contains 0.5 percent or more asbestos by weight;
- Non-friable acoustic ceiling tiles;
- Non-friable vinyl floor tiles and mastic.

The following materials were **not** sampled:

- Materials previously identified in previous reports provided as asbestos-containing;
- Materials previously confirmed to be non-asbestos in accordance with O.Reg. 278/05;
- Unless damaged the following materials were not sampled: plaster, drywall joint compound, mastic, window caulking, roofing materials, vinyl sheet flooring. Materials not sampled are assumed to contain asbestos.
- Materials where sampling poses an inherent, imminent danger to the Assessor such as high voltage wiring, materials present at heights greater than 12 feet, or those in confined spaces. These materials are assumed to be asbestos-containing.

In some cases, manufactured products such as asbestos cement pipe are visually identified without sample confirmation.

---

<sup>1</sup> Environmental Protection Agency

Pinchin submits the bulk samples to a NVLAP<sup>2</sup> accredited laboratory for analysis. The analysis is performed in accordance with Test Method EPA/600/R-93/116: Method for the Determination of Asbestos in Bulk Building Materials, July 1993.

The asbestos analysis is completed using a stop positive approach. Only one result of greater than the regulated criteria (0.5%) is required to determine that a material is asbestos-containing, but all samples must be analyzed to conclusively determine that a material is non-asbestos. The laboratory stops analyzing samples from a homogeneous material once a result greater than the regulated criteria is detected in any of the samples of that material. All samples of a homogeneous material are analyzed if no asbestos is detected. In some cases, all samples are analyzed in the sample set regardless of result. Where building materials are described in the report as non-asbestos, or described as containing no asbestos, this is subject to the limitations of the analytical method used, and should be understood to mean no asbestos was detected.

Asbestos materials are evaluated in order to make recommendations regarding remedial work. The priority for remedial action is based on several factors:

- friability (friable or non-friable).
- condition (good, fair, poor, debris, based on definitions in the SOP).
- accessibility (ranking from accessible to all building users to inaccessible).
- visibility (whether the material is obscured by other building components).
- efficiency of the work (for example, if damaged ACM is being removed in an area, it may be most practical to remove all ACM in the area even if it is in good condition).

This includes friability, condition and efficiency and practicality of the work.

### 1.3 Lead

Pinchin collected samples of damaged paint not identified in a previous report. Drawings included show sample locations.

Analysis for lead in paints or surface coatings is performed in accordance with EPA Method No. 3050B/Method No. 7420; flame atomic absorption at an accredited laboratory.

For this report, all paints containing lead at a concentration 0.1% or greater are discussed. Paint was evaluated for condition.

Lead building products (e.g. batteries, lead sheeting, flashing) are identified by visual observation only.

---

<sup>2</sup> National Voluntary Laboratory Accreditation Program

#### 1.4 Silica

Pinchin identifies building materials suspected of containing crystalline silica (e.g. concrete, cement, tile, brick, masonry, mortar) by knowledge of current and historic applications and visual inspection only.

Pinchin does not perform sampling of these materials for laboratory analysis of crystalline silica content.

#### 1.5 Mercury

Building materials/products/equipment (e.g. thermostats, barometers, pressure gauges, light tubes), suspected to contain mercury were identified by visual inspection only. Dismantling of equipment suspected of containing mercury was not performed. Sampling of these materials for laboratory analysis of mercury content was not performed.

Mercury spills or damaged mercury-containing equipment was recorded where observed.

#### 1.6 Polychlorinated Biphenyls

Pinchin determines the potential for light ballast and wet transformers to contain PCBs based on the age of the building, a review of maintenance records and examination of labels or nameplates on equipment, where present and accessible. The information is compared to known ban dates of PCBs and Environment Canada publications.

Dry type transformers are assumed to be free of dielectric fluids and hence non-PCB.

Pinchin records spills or leakage of suspect PCB-containing fluids where observed.

Fluids (mineral oil, hydraulic or Askaral) in transformers or other equipment are not sampled for PCB content.

Non-liquid forms of PCBs (i.e. sealants or caulking) are not sampled for PCB content.

#### 1.7 Visible Mould

Pinchin identifies the presence of mould if visibly present in a significant quantity on exposed building surfaces. If any mould growth is concealed within wall cavities it is not addressed in this survey.

## 1.0. EXECUTIVE SUMMARY

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work areas for Finch Yard Building A, located at 1026 Finch Avenue West, Toronto, Ontario, herein after referred to as the "Site". The site inspection and sampling works were conducted on March 7, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

### **Asbestos**

Fisher was provided with the report of a previous DSS, which was conducted by ECOH Management Inc. on September 26, 2018. This report has indicated the following previously identified assumed and/or confirmed ACM within the specified work area(s):

- Caulking (windows/doors),
- Plaster,
- Pipe Insulation, and
- Transite Pipe.

Fisher conducted a previous survey for IBI Group on March 23, 2021. This report indicated that tan caulking along the joints of the block walls in the corridor, was determined to be asbestos containing and was expected to be disturbed during the planned construction works.

During the current survey, three (3) bulk samples of building materials found within the specified work areas and that could potentially contain asbestos, were collected and submitted to Fisher Environmental Laboratories for Polarised Light Microscopy (PLM) analysis, as outlined in NIOSH Method 9002. The results of analysis revealed the material sampled does not contain asbestos.

Based on the findings of the survey, Fisher recommendations are as follows:

- Provide a copy of this report to contractors bidding on or performing work within the subject work areas;
- Remove the asbestos-containing tan caulking along the joints of the block walls using Type 1 abatement procedures, as outlined in O. Reg. 278/05.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

### **Lead**

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current investigation, four (4) bulk samples of paint were collected for lead analysis and submitted to Fisher Environmental Laboratories for lead analysis.

The results of analysis revealed that measurable quantities of lead were identified in the grey paint collected from the door frame, green paint collected from the exterior of the wall in the office area, beige paint from the wall of the 2<sup>nd</sup> floor lunch room and dark green paint from the handrailing of the stairs to 2<sup>nd</sup> floor, however, all were below the action limit.

Fisher recommends that, prior to the planned renovation work, the removal of lead containing materials found within the specified work area(s), must be conducted using the appropriate lead abatement procedures. Lead abatement procedures to be used are determined by the method(s) of disturbance employed. Refer to *MOL Guideline: Lead on Construction Projects*, for details

### **Mercury**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey. Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

### **Silica**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings. If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to *MOL Guideline: Silica on Construction Projects* for details.

**Other Designated Substances**

The other Designated Substances would not be expected to be present at the Site. No immediate actions were recommended with regard to acrylonitrile, arsenic, benzene, coke oven emissions, ethylene oxide, isocyanates, and vinyl chloride.

**Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work areas. No action is recommended with regard to mould.

## 2.0. INTRODUCTION

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work areas for Finch Yard Building A, located at 1026 Finch Avenue West, Toronto, Ontario, herein after referred to as the "Site". The site inspection and sampling works were conducted on March 7, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

## 3.0. REGULATIONS

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

The OHSA, R.S.O. 1990, under the Ontario MOL, defines a toxic substance as a biological, chemical or physical agent (or a combination of such agents) whose presence in the workplace may endanger the health and safety of a worker. Sections of the Act that deals with toxic substances are intended to:

1. ensure that worker exposure to toxic substances is controlled;
2. ensure that toxic substances in the workplace are clearly identified and that workers are provided with enough information to be capable of handling them safely; and,
3. provide the general public with access to information about toxic substances used by industry in their communities.

The Act makes provision for a toxic substance to be "designated", where its use in the workplace is prohibited, regulated, restricted, limited or controlled. Designation is reserved for eleven substances that are particularly hazardous, covered under O. Reg 490/09 – *Designated Substances* that was implemented on July 1, 2010, and include Acrylonitrile, Arsenic, Asbestos, Benzene, Coke Oven Emissions, Ethylene Oxides, Isocyanates, Lead, Mercury, Silica, and Vinyl Chloride. Formerly, regulations for these substances were passed separately and each outlined exposure limits where workers were likely to inhale, ingest and / or absorb the substance.

O. Reg. 490/09 provides a consistent approach to dealing with existing requirements and provisions, and outlines steps required to control worker exposure to these substances, including by inhalation, ingestion, skin absorption or skin contact. Each designated substance has an allowable level of exposure based on a time-weighted average (TWA) limit, and may also have a short-term exposure limit (STEL) and / or ceiling limit (C) assigned to it. TWA refers to the time-weighted average airborne concentration of a biological or chemical agent to which a worker may be exposed in a work day or work week, STEL refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed in any 15 minute period, and C refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed at any time. Refer to O. Reg. 490/09 – *Designated Substances*.

A supplementary regulation regarding control of asbestos exposures in the construction industry has evolved into O. Reg. 278/05 – *Asbestos on Construction Projects and in Buildings and Repair Operations*. The regulation includes a definition of asbestos-containing materials (ACM), requirements for additional training and clearance air testing, procedures for determining materials that meet the definition of ACM and for the use of glove bags, and provisions for varying from measure and procedures set out in the regulation.

In addition to the OHSA and regulations regarding designated substances, the following regulations, guidelines and standards were also taken into account or referenced:

- O. Reg. 213/91 - *Construction Projects* regulated under the OHSA and last amended by O. Reg. 443/09;
- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*;
- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes;
- MOL *Guideline: Lead on Construction Projects*, 2011; and,
- MOL *Guideline: Silica on Construction Projects*, 2011.

#### **4.0. METHODOLOGY**

Fisher followed the protocols outlined in O. Reg. 278/05 for collecting and analyzing bulk samples of materials suspected to contain asbestos. Visual assessment of the material was the primary method of identification with occasional physical contact for the purpose of collecting bulk samples or examining for underlying layers.

Where applicable, samples of suspect materials were collected in order to establish asbestos or lead content. Samples were grouped according to similarity of appearance (“homogeneous” materials). The frequency at which the samples were collected was sufficient to obtain a general representation of the presence of these materials at the Site. Samples collected are presumed to

be representative of respective building materials in-place at the Site. However, due to potential past renovations, alterations, repairs, or phases of construction, it is possible that individual materials may not be representative of samples collected.

Sampling of roofing materials was not part of the current scope of work. Further, sampling of materials found within operating equipment, portable building articles, or generally non-accessible components such as insulation within electrical switch gears, wiring, motors, light fixtures, elevator brakes, fire door cores, etc. was not performed as part of the current survey.

Samples collected during the survey were placed in plastic zip-lock bags which were labeled and submitted for laboratory analysis. Fisher Environmental Laboratories analysed bulk samples for asbestos type and approximate percent content by performing polarized light microscopy (PLM), as outlined in NIOSH Method 9002. Fisher Environmental Laboratories analysed samples for lead content in paint by performing acid digestion followed by Inductively Coupled Plasma (ICP) analysis.

Site Plan(s), indicating specific work area(s), bulk sample locations and any area(s) of asbestos, are included in Appendix A. The laboratory certificate(s) of analysis are included in Appendix B. Representative photos of Site conditions encountered at the time of the current survey are included in Appendix C.

## **5.0. REVIEW OF PREVIOUS REPORTS**

Fisher was provided with the report of a previous DSS, which was conducted by ECOH Management Inc. on September 26, 2018, attached in Appendix D. This report has indicated the following previously identified assumed and/or confirmed ACM within the specified work area(s):

- Caulking (windows/doors),
- Plaster,
- Pipe Insulation, and
- Transite Pipe.

Fisher conducted a previous survey for IBI Group on March 23, 2021. This report indicated that tan caulking along the joints of the block walls in the corridor, was determined to be asbestos containing and was expected to be disturbed during the planned construction works.

Details are provided in the summaries found in the asbestos sections of this report.

## **6.0. FINDINGS AND RECOMMENDATIONS**

### **6.1. Acrylonitrile**

Acrylonitrile would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Acrylonitrile are warranted at this time.

## **6.2. Arsenic**

Arsenic would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Arsenic are warranted at this time.

## **6.3. Asbestos**

### **6.3.1. General Information**

Asbestos is the name given to a group of six different fibrous minerals (amosite, chrysotile, crocidolite, and the fibrous varieties of tremolite, actinolite and anthophyllite) that occur naturally in the environment. Asbestos minerals have separable long fibres that are strong and flexible enough to be spun and woven and are heat resistant.

Because of these characteristics, asbestos has been used for a wide range of manufactured goods, mostly in building materials (roofing shingles, ceiling and floor tiles, paper products, and asbestos cement products), friction products (automobile clutch, brake, and transmission parts), heat-resistant fabrics, packaging, gaskets, and coatings. Some vermiculite or talc products may also contain asbestos.

Asbestos fibres may be released into the air by the disturbance of ACM during product use, renovation or demolition work, building or home maintenance, repair and remodeling. In general, exposure may occur only when the ACM is disturbed in some way to release particles and fibres into the air.

### **6.3.2. Friable vs. Non-Friable ACM**

Based on the requirements of O. Reg. 278/05 and due diligence, an asbestos survey and report must be available at any workplace where asbestos exists identifying locations and types of ACM in the building. The survey must include both friable and non-friable materials confirmed to contain asbestos, as well as any other materials which were not sampled but are suspected (presumed) ACM. The term friable refers to material(s) that could be readily reduced to dust or powder when crushed by hand or moderate pressure. Friable materials have a much greater chance of releasing airborne asbestos fibres when disturbed.

In the past, the most commonly used friable asbestos-containing building materials were surfacing materials (e.g. sprayed on fireproofing, texture, decorative or acoustic plaster) as well as thermal insulation. Examples of manufactured asbestos-containing materials include vinyl floor tiles, ceiling tiles, gasket materials, asbestos cement (transite) pipes or boards, and asbestos textiles. Depending on the above noted formulation, these materials range from non-friable to friable. Although some products are considered non-friable when in Good condition, severe damage or deterioration may cause non-friable materials to generate airborne dust more readily. Severely damaged non-friable materials, or those to be worked on with powered tools, may be considered as friable ACM for abatement purposes.

Examples of common types of ACM by friability include:

- Friable ACM
  - Sprayed Materials (or materials installed by roller or trowel), such as fireproofing, thermal insulation, texture finishes, etc.
  - Mechanical Insulation such as boiler and breeching, ductwork, piping, tanks and associated equipment.
  - Plaster
- Potentially Friable ACM
  - Acoustic Ceiling Tiles
  - Vinyl Sheet Flooring
- Non-Friable ACM
  - Vinyl Floor Tiles
  - Asbestos cement (“transite”) piping or paneling
  - Window Caulking

### 6.3.3. Regulations

Exposure to asbestos is controlled by two Regulations passed under Ontario’s Occupational Health and Safety Act (OHSA), R.R.O. 1990.

- O. Reg. 490/09 – *Designated Substances* regarding asbestos applies to:
  - every employer operating a mine for the purpose of mining, crushing, grinding or sifting asbestos;
  - every employer processing, adapting or using asbestos in connection with manufacturing or assembling of goods or products;
  - every employer engaged in the repair, alteration or maintenance of machinery, equipment, aircraft, ships, locomotives, railway cars and vehicles;
  - every employer engaged in work on a building that is necessarily incidental to the repair, alteration or maintenance of machinery or equipment; and,
  - to those workers of such employers who are likely to be exposed to asbestos.

Exposure limits for this substance are set at 0.1 f/cc (TWA) for all types of asbestos.

- O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* applies to buildings that contain friable and non-friable ACM and to the repair, alteration and/or maintenance of these buildings.

In addition to regulations for controlling work around asbestos-containing building materials there are regulations for packaging, transportation and disposal of asbestos-containing waste:

- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*, and,
- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes.

#### **6.3.4. Findings**

Samples of homogenous materials suspected to contain asbestos were collected and submitted for analysis. Fisher collected three (3) bulk samples of building materials found within the specified work area(s) and that could potentially contain asbestos. Findings of all building materials identified within the specified work area(s) are outlined in further detail below.

##### **6.3.4.1. Sprayed or Troweled Fireproofing and Thermal Insulation**

No indication of sprayed or troweled fireproofing and / or thermal insulation was noted in any of the specified work area(s) during the current survey.

##### **6.3.4.2. Texture Finish**

No texture finish was noted in any of the specified work area(s) during the current survey.

##### **6.3.4.3. Mechanical Insulation**

The previous report confirmed asbestos-containing mechanical insulation in the form of aircell insulation and magnesia block and assumed asbestos-containing mechanical insulation in the form of paring cement, are present at the Site, but not observed within the specified work areas.

##### **6.3.4.4. Acoustic Ceiling Tile**

During the survey, one (1) type of ceiling tile were observed within the specific work areas.

- Ceiling Tile 1 (2'x4' Pinprick with Random Small Fissures)

The previous report confirmed that Ceiling Tile 1 was sampled for analysis. The results of analysis revealed this ceiling tile does not contain asbestos.

##### **6.3.4.5. Plaster / Drywall Joint Compound**

Drywall Joint Compound (DJC) was observed throughout the building. Three (3) samples of the DJC were previously collected for analysis. The results of analysis revealed that the DJC does not contain asbestos.

##### **6.3.4.6. Asbestos Cement Products**

The previous report confirmed asbestos cement products, such as Transite Pipe, are present at the Site, but not observed within the specified work areas.

##### **6.3.4.7. Vinyl Sheet Flooring**

No vinyl sheet flooring was noted in any of the specified work area(s) during the current survey.

#### **6.3.4.8. Vinyl Floor Tile**

During the current survey, one (1) vinyl floor tile was observed within the specified work area(s).

- Vinyl Floor Tile 1 – 12" x 12", White with Black Square Design

The previous report confirmed that Vinyl Floor Tile 1 was sampled for analysis. The results of analysis revealed this vinyl floor tile does not contain asbestos.

#### **6.3.4.9. Other ACM**

##### Cream Caulking

Cream caulking was observed along the joints of the block wall and the door frames in the corridor by the main entrance, the washrooms and around the window frames of the open office area. Three (3) samples of the cream caulking were previously collected for analysis. The results of analysis revealed that the cream caulking does not contain asbestos.

##### Beige Caulking

Beige caulking was observed along the joints of the block wall and the door frame of the classroom. Three (3) samples of the beige caulking were previously collected for analysis. The results of analysis revealed that the beige caulking around the door frame does not contain asbestos.

##### Tan Caulking

Tan caulking was observed along the joints of the block walls in the corridor. Three (3) samples of the tan caulking were previously collected for analysis. The results of analysis revealed that the tan caulking along the joints of the block walls contains 0.5-5% Chrysotile asbestos.

##### Grey Caulking

Grey caulking was observed along the joints of the block walls and the door frames in the office area. Three (3) samples of the grey caulking were previously collected for analysis. The results of analysis revealed that the grey caulking does not contain asbestos.

##### Black Putty

Black putty was observed along the gap between the glasses and the frames of the glass wall in the office room within the specific work areas. Three (3) samples of the black putty were collected for analysis. The results of analysis revealed that the black putty does not contain asbestos.

#### **6.3.5. Recommendations**

Prior to demolition or any renovation activities, all asbestos-containing materials must be removed from the specified work area(s) in accordance with O. Reg. 278/05 - *Asbestos on Construction*

*Projects and in Buildings and Repair Operations*, and be disposed of at a MOE licensed landfill in accordance with O. Reg. 558/00 (amending O. Reg. 347, *General – Waste Management*).

Refer to attached Site Plans in Appendix A, which illustrate where the ACM is located within the specified work areas.

Specifically, Fisher recommends the following:

- Provide a copy of this report to contractors bidding on or performing work within the subject work areas;
- Remove the asbestos-containing tan caulking along the joints of the block walls using Type 1 abatement procedures, as outlined in O. Reg. 278/05.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

The presence of ACM should be presumed in locations not accessed during this survey. It is possible that ACM is present at the Site that is not identified in this report. Should additional suspected ACM be discovered, it should be presumed as ACM until sample analysis determines asbestos content.

Due to the limited nature of the current scope of work and the presence of solid building finishes (i.e. plaster or drywall walls and ceilings etc.) in many locations, the full extent of ACM may not be confirmed. Precautions should be taken when dismantling solid wall or ceiling finishes, or any other building surfaces which may conceal potential ACM. Such precautions include, but are not limited to, isolation measures and appropriate personal protective equipment.

#### **6.4. Benzene**

Benzene would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Benzene are warranted at this time.

#### **6.5. Coke Oven Emissions**

Coke oven emissions would not be expected to be present at the Site and were not observed during the current survey. No recommendations for coke oven emissions are warranted at this time.

#### **6.6. Ethylene Oxides**

Ethylene oxides would not be expected to be present at the Site and were not observed during the current survey. No recommendations for ethylene oxides are warranted at this time.

## **6.7. Isocyanates**

Isocyanates would not be expected to be present at the Site and were not observed during the current survey. No recommendations for isocyanates are warranted at this time.

## **6.8. Lead**

### **6.8.1. General Information**

Lead is a naturally occurring bluish-gray metal found in small amounts in the earth's crust. Most lead in the environment comes from human activities such as burning fossil fuels, mining and manufacturing. Lead is used in the production of batteries, ammunition, metal products (solder and pipes) and X-ray devices.

Lead does not break down but lead compounds are changed by sunlight, air and water. Exposure occurs when eating food or drinking water that contains lead. Deteriorated lead paint can contribute to lead dust. The main target for lead toxicity is the nervous system.

### **6.8.2. Regulations and Guidelines**

The Ontario MOL has not prescribed criteria defining an analyzed sample of bulk material as "lead-containing". Further, the MOL has not established a lower limit for concentrations of lead in paint, below which precautions do not need to be considered during construction projects. However, except for very aggressive disturbance of painted finishes, (e.g., abrasive blasting, torch cutting, or grinding), Fisher believes that a lead content below 0.1% by weight (1,000 ug/g or 1000 ppm) represents a concentration in which the lead content is not the limiting hazard for construction hygiene purposes. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations.

The regulation for the designated substance lead applies to every employer and worker at a workplace where lead is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to lead. Exposure limits for this substance are set at 0.05 – 0.10 mg/m<sup>3</sup> (TWA) depending on the type of lead, and for tetraethyl lead 0.30 mg/m<sup>3</sup> (STEL).

Additionally, in 2011 the MOL revised *Guideline: Lead on Construction Projects* outlining practices that should be followed during construction projects to protect workers' from exposure to lead. This includes the methods and equipment employed in the removal of lead-containing coatings that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **6.8.3. Findings**

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current

investigation, four (4) bulk samples of paint were collected and submitted to Fisher Environmental Laboratories for lead analysis.

The results of analysis revealed that measurable quantities of lead were identified in the grey paint collected from the door frame, green paint collected from the exterior of the wall in the office area, beige paint from the wall of the 2<sup>nd</sup> floor lunch room and dark green paint from the handrailing of the stairs to 2<sup>nd</sup> floor, however, all were below the action limit.

#### 6.8.4. Recommendations

Where any lead-containing materials may be disturbed or removed, Fisher recommends that appropriate lead abatement procedures be used. The lead abatement procedures to be used are determined by the method(s) of disturbance employed. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations. The table below outlines lead abatement operations and associated respirator required, as outlined in Ontario MOL guidelines.

#### Classifications of Lead-Containing Operations and Required Respirator

<b>Type 1 Operations</b> (where concentrations of airborne lead would be expected to be < 0.05 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Removal of lead containing coatings with chemical gel or paste and fibrous laminated cloth wrap</li> <li>• Removal of lead containing coatings / materials using power tool that has an effective dust collection system equipped with HEPA filter</li> <li>• Removal of lead containing coatings / materials using non-powered hand tools other than manual scraping or sanding</li> </ul>	Respirators should not be necessary if general procedures are followed and level of air is less than 0.05 mg/m <sup>3</sup> . However, if worker wishes to use a respirator, a half-mask particulate respirator with N-, R- or P-series filter, and 95, 99 or 100% efficiency should be provided.
<b>Type 2a Operations</b> (where concentrations of airborne lead would be expected to be > 0.05 to 0.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Removal of lead containing coatings / materials by scraping or sanding using non-powered hand tools</li> <li>• Manual demolition of lead painted plaster walls / building components by striking with a sledgehammer or similar tool</li> </ul>	NIOSH APF = 10 Half-mask particulate respirator with N-, R- or P- series filter, and 95, 99 or 100% efficiency.
<b>Type 2b Operations</b> (where concentrations of airborne lead would be expected to be > 0.50 to 1.25 mg/m <sup>3</sup> )	
Not applicable to potential renovation activities.	
<b>Type 3a Operations</b> (where concentrations of airborne lead would be expected to be > 1.25 to 2.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Welding or high temperature cutting of lead-containing coatings or materials indoors or in a confined space.</li> <li>• Dry removal of lead-containing mortar using an electronic or pneumatic cutting device.</li> <li>• Burning of a surface containing lead</li> <li>• Removal of lead containing coatings / materials using power tools without an effective dust collection system equipped with HEPA filter</li> </ul>	NIOSH APF = 50  Full-face piece air-purifying respirator with N-, R- or P- series filter and 100% efficiency.  Tight-fitting powered air-purifying respirator with high efficiency filter.  Full-face piece supplied-air respirator operated in demand mode.  Half-mask or full-face piece supplied air respirator operated in continuous-flow mode.

<b>Type 3b Operations</b> (where concentrations of airborne lead would be expected to be > 2.50 mg/m <sup>3</sup> )	
Abrasive blasting of lead-containing coatings or materials.	NIOSH APF ≥1000 Type CE abrasive-blast supplied respirator operated in a positive pressure mode with a tight-fitting half-mask face piece.

Refer to MOL *Guideline: Lead on Construction Projects, 2011*, for details of the Ministry's health and safety guidelines regarding lead.

## **6.9. Mercury**

### **6.9.1. General Information**

Mercury is a naturally occurring metal. It is a shiny, silver-white and odourless liquid. It combines with other elements to form inorganic compounds or salts. Metallic mercury is used to produce chlorine gas and caustic soda, and is used in thermostats and thermometers, fluorescent light bulbs, dental fillings and batteries. Exposure occurs when eating fish or shellfish contaminated with methyl mercury, breathing vapors from spills, incinerators, etc.

The nervous system is very sensitive to all forms of mercury. Exposure to high levels of metallic inorganic or organic mercury can permanently damage the brain, kidneys and developing fetus. Short-term exposure may cause lung damage, nausea, vomiting and diarrhea as well as skin and eye irritation.

### **6.9.2. Regulations**

The regulation for mercury applies to every employer and worker at a workplace where mercury is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to mercury. Exposure limits for this substance are set at 0.025 – 0.01 mg/m<sup>3</sup> (TWA) for all forms of mercury excluding alkyl, and for alkyl compounds of mercury 0.03 mg/m<sup>3</sup> (STEL).

### **6.9.3. Findings**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey.

### **6.9.4. Recommendations**

Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

## **6.10. Silica**

### **6.10.1. General Information**

Silica is a crystalline compound occurring abundantly as quartz, sand, and many other minerals, and used to manufacture a variety of materials, especially glass and concrete. When mining this substance, silica can be deadly when it becomes airborne. If inhaled, silica dust can cause silicosis which can be fatal. Some of the following industries have a high potential for risk to workers: construction (sandblasting, rock drilling, masonry work, jack hammering, tunneling), mining (cutting or drilling through sandstone or granite), foundry work (grinding, mouldings, shakeout, core room), stone cutting (sawing, abrasive blasting, chipping, grinding), manufacturing and use of abrasives, etc.

### **6.10.2. Regulations**

The regulation for silica applies to every employer and worker at a workplace where silica is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to silica. Exposure limits for this substance are set at 0.05 - 0.10 mg/m<sup>3</sup> (TWA), depending on the type of silica.

Additionally, in 2011 the MOL revised *Guideline: Silica on Construction Projects* outlining practices that should be followed during construction projects to protect workers' from exposure to silica. This includes the methods and equipment employed in the removal of silica-containing materials that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **6.10.3. Findings**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings.

### **6.10.4. Recommendations**

If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to MOL *Guideline: Silica on Construction Projects* for details.

## **6.11. Vinyl Chloride**

Vinyl chloride would not be expected to be present at the Site and was not observed during the current survey. No recommendations for vinyl chloride are warranted at this time.

## **6.12. Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work area(s). No action is recommended with regard to mould.

## 7.0. LIMITATIONS

Fisher Environmental Ltd. accepts responsibility for the competent performance of its duties in executing this assignment within the normal standards of the profession, but disclaims responsibility for consequential damages, if any.

The scope of the survey is based on prior agreement with the client, and the rationale given in this report. The survey findings rely on professional interpretation of selective sampling and analysis. Sample analysis results have been applied to homogenous materials in unsampled locations; it was not within the scope of work to carry out an exhaustive sampling and analysis program. For non-accessible building spaces, the likelihood of the presence or absence of asbestos and other designated substances has been described, but such assessment is not a definitive statement of presence or absence.

This report was prepared for the IBI Group. The scope of services performed may not be appropriate for the purposes of other users, and any use or reuse of this document or its findings or recommendations represented herein is at the sole risk of any other user.

We trust that the information provided in the report meets your current requirements. If you have any questions or concerns, please do not hesitate to contact the undersigned.

Respectfully submitted,

Iqbal Fattah, M.Sc.  
Project Manager

David Fisher, P. Eng., C. Chem.  
Principal

## 1.0. EXECUTIVE SUMMARY

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work areas for Finch Yard Building A, located at 1026 Finch Avenue West, Toronto, Ontario, herein after referred to as the "Site". The site inspection and sampling works were conducted on March 23, 2021.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on March 16, 2021.

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

### **Asbestos**

Fisher was provided with the report of a previous DSS, which was conducted by ECOH Management Inc. on September 26, 2018. This report has indicated the following previously identified assumed and/or confirmed ACM within the specified work area(s):

- Caulking (windows/doors),
- Plaster,
- Pipe Insulation, and
- Transite Pipe.

During the current survey, fifteen (15) bulk samples of building materials found within the specified work areas and that could potentially contain asbestos, were collected and submitted to Fisher Environmental Laboratories for Polarised Light Microscopy (PLM) analysis, as outlined in NIOSH Method 9002.

Based on the current results of laboratory analysis and information provided in the previous report, the following material are found to contain asbestos;

- Tan caulking along the joints of the block walls in the Corridor.

Based on the findings of the survey, Fisher recommendations are as follows:

- Provide a copy of this report to contractors bidding on or performing work within the subject work areas;
- Remove the asbestos-containing tan caulking along the joints of the block walls using Type 1 abatement procedures, as outlined in O. Reg. 278/05.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

### **Lead**

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current investigation, no samples were collected for lead analysis.

Fisher recommends that, prior to the planned renovation work, the removal of lead containing materials found within the specified work area(s), must be conducted using the appropriate lead abatement procedures. Lead abatement procedures to be used are determined by the method(s) of disturbance employed. Refer to *MOL Guideline: Lead on Construction Projects*, for details

### **Mercury**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey. Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

### **Silica**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings. If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to *MOL Guideline: Silica on Construction Projects* for details.

### **Other Designated Substances**

The other Designated Substances would not be expected to be present at the Site. No immediate actions were recommended with regard to acrylonitrile, arsenic, benzene, coke oven emissions, ethylene oxide, isocyanates, and vinyl chloride.

**Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work areas. No action is recommended with regard to mould.

## 2.0. INTRODUCTION

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work areas for Finch Yard Building A, located at 1026 Finch Avenue West, Toronto, Ontario, herein after referred to as the "Site". The site inspection and sampling works were conducted on March 23, 2021.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on March 16, 2021.

## 3.0. REGULATIONS

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

The OHSA, R.S.O. 1990, under the Ontario MOL, defines a toxic substance as a biological, chemical or physical agent (or a combination of such agents) whose presence in the workplace may endanger the health and safety of a worker. Sections of the Act that deals with toxic substances are intended to:

1. ensure that worker exposure to toxic substances is controlled;
2. ensure that toxic substances in the workplace are clearly identified and that workers are provided with enough information to be capable of handling them safely; and,
3. provide the general public with access to information about toxic substances used by industry in their communities.

The Act makes provision for a toxic substance to be "designated", where its use in the workplace is prohibited, regulated, restricted, limited or controlled. Designation is reserved for eleven substances that are particularly hazardous, covered under O. Reg 490/09 – *Designated Substances* that was implemented on July 1, 2010, and include Acrylonitrile, Arsenic, Asbestos, Benzene, Coke Oven Emissions, Ethylene Oxides, Isocyanates, Lead, Mercury, Silica, and Vinyl Chloride. Formerly, regulations for these substances were passed separately and each outlined exposure limits where workers were likely to inhale, ingest and / or absorb the substance.

O. Reg. 490/09 provides a consistent approach to dealing with existing requirements and provisions, and outlines steps required to control worker exposure to these substances, including by inhalation, ingestion, skin absorption or skin contact. Each designated substance has an allowable level of exposure based on a time-weighted average (TWA) limit, and may also have a short-term exposure limit (STEL) and / or ceiling limit (C) assigned to it. TWA refers to the time-weighted average airborne concentration of a biological or chemical agent to which a worker may be exposed in a work day or work week, STEL refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed in any 15 minute period, and C refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed at any time. Refer to O. Reg. 490/09 – *Designated Substances*.

A supplementary regulation regarding control of asbestos exposures in the construction industry has evolved into O. Reg. 278/05 – *Asbestos on Construction Projects and in Buildings and Repair Operations*. The regulation includes a definition of asbestos-containing materials (ACM), requirements for additional training and clearance air testing, procedures for determining materials that meet the definition of ACM and for the use of glove bags, and provisions for varying from measure and procedures set out in the regulation.

In addition to the OHSA and regulations regarding designated substances, the following regulations, guidelines and standards were also taken into account or referenced:

- O. Reg. 213/91 - *Construction Projects* regulated under the OHSA and last amended by O. Reg. 443/09;
- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*;
- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes;
- MOL *Guideline: Lead on Construction Projects*, 2011; and,
- MOL *Guideline: Silica on Construction Projects*, 2011.

#### **4.0. METHODOLOGY**

Fisher followed the protocols outlined in O. Reg. 278/05 for collecting and analyzing bulk samples of materials suspected to contain asbestos. Visual assessment of the material was the primary method of identification with occasional physical contact for the purpose of collecting bulk samples or examining for underlying layers.

Where applicable, samples of suspect materials were collected in order to establish asbestos or lead content. Samples were grouped according to similarity of appearance (“homogeneous” materials). The frequency at which the samples were collected was sufficient to obtain a general representation of the presence of these materials at the Site. Samples collected are presumed to

be representative of respective building materials in-place at the Site. However, due to potential past renovations, alterations, repairs, or phases of construction, it is possible that individual materials may not be representative of samples collected.

Sampling of roofing materials was not part of the current scope of work. Further, sampling of materials found within operating equipment, portable building articles, or generally non-accessible components such as insulation within electrical switch gears, wiring, motors, light fixtures, elevator brakes, fire door cores, etc. was not performed as part of the current survey.

Samples collected during the survey were placed in plastic zip-lock bags which were labeled and submitted for laboratory analysis. Fisher Environmental Laboratories analysed bulk samples for asbestos type and approximate percent content by performing polarized light microscopy (PLM), as outlined in NIOSH Method 9002. Fisher Environmental Laboratories analysed samples for lead content in paint by performing acid digestion followed by Inductively Coupled Plasma (ICP) analysis.

Site Plan(s), indicating specific work area(s), bulk sample locations and any area(s) of asbestos, are included in Appendix A. The laboratory certificate(s) of analysis are included in Appendix B. Representative photos of Site conditions encountered at the time of the current survey are included in Appendix C.

## **5.0. REVIEW OF PREVIOUS REPORTS**

Fisher was provided with the report of a previous DSS, which was conducted by ECOH Management Inc. on September 26, 2018, attached in Appendix D. This report has indicated the following previously identified assumed and/or confirmed ACM within the specified work area(s):

- Caulking (windows/doors),
- Plaster,
- Pipe Insulation, and
- Transite Pipe.

Details are provided in the summaries found in the asbestos sections of this report.

## **6.0. FINDINGS AND RECOMMENDATIONS**

### **6.1. Acrylonitrile**

Acrylonitrile would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Acrylonitrile are warranted at this time.

## **6.2. Arsenic**

Arsenic would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Arsenic are warranted at this time.

## **6.3. Asbestos**

### **6.3.1. General Information**

Asbestos is the name given to a group of six different fibrous minerals (amosite, chrysotile, crocidolite, and the fibrous varieties of tremolite, actinolite and anthophyllite) that occur naturally in the environment. Asbestos minerals have separable long fibres that are strong and flexible enough to be spun and woven and are heat resistant.

Because of these characteristics, asbestos has been used for a wide range of manufactured goods, mostly in building materials (roofing shingles, ceiling and floor tiles, paper products, and asbestos cement products), friction products (automobile clutch, brake, and transmission parts), heat-resistant fabrics, packaging, gaskets, and coatings. Some vermiculite or talc products may also contain asbestos.

Asbestos fibres may be released into the air by the disturbance of ACM during product use, renovation or demolition work, building or home maintenance, repair and remodeling. In general, exposure may occur only when the ACM is disturbed in some way to release particles and fibres into the air.

### **6.3.2. Friable vs. Non-Friable ACM**

Based on the requirements of O. Reg. 278/05 and due diligence, an asbestos survey and report must be available at any workplace where asbestos exists identifying locations and types of ACM in the building. The survey must include both friable and non-friable materials confirmed to contain asbestos, as well as any other materials which were not sampled but are suspected (presumed) ACM. The term friable refers to material(s) that could be readily reduced to dust or powder when crushed by hand or moderate pressure. Friable materials have a much greater chance of releasing airborne asbestos fibres when disturbed.

In the past, the most commonly used friable asbestos-containing building materials were surfacing materials (e.g. sprayed on fireproofing, texture, decorative or acoustic plaster) as well as thermal insulation. Examples of manufactured asbestos-containing materials include vinyl floor tiles, ceiling tiles, gasket materials, asbestos cement (transite) pipes or boards, and asbestos textiles. Depending on the above noted formulation, these materials range from non-friable to friable. Although some products are considered non-friable when in Good condition, severe damage or deterioration may cause non-friable materials to generate airborne dust more readily. Severely damaged non-friable materials, or those to be worked on with powered tools, may be considered as friable ACM for abatement purposes.

Examples of common types of ACM by friability include:

- Friable ACM
  - Sprayed Materials (or materials installed by roller or trowel), such as fireproofing, thermal insulation, texture finishes, etc.
  - Mechanical Insulation such as boiler and breeching, ductwork, piping, tanks and associated equipment.
  - Plaster
- Potentially Friable ACM
  - Acoustic Ceiling Tiles
  - Vinyl Sheet Flooring
- Non-Friable ACM
  - Vinyl Floor Tiles
  - Asbestos cement (“transite”) piping or paneling
  - Window Caulking

### 6.3.3. Regulations

Exposure to asbestos is controlled by two Regulations passed under Ontario’s Occupational Health and Safety Act (OHSA), R.R.O. 1990.

- O. Reg. 490/09 – *Designated Substances* regarding asbestos applies to:
  - every employer operating a mine for the purpose of mining, crushing, grinding or sifting asbestos;
  - every employer processing, adapting or using asbestos in connection with manufacturing or assembling of goods or products;
  - every employer engaged in the repair, alteration or maintenance of machinery, equipment, aircraft, ships, locomotives, railway cars and vehicles;
  - every employer engaged in work on a building that is necessarily incidental to the repair, alteration or maintenance of machinery or equipment; and,
  - to those workers of such employers who are likely to be exposed to asbestos.

Exposure limits for this substance are set at 0.1 f/cc (TWA) for all types of asbestos.

- O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* applies to buildings that contain friable and non-friable ACM and to the repair, alteration and/or maintenance of these buildings.

In addition to regulations for controlling work around asbestos-containing building materials there are regulations for packaging, transportation and disposal of asbestos-containing waste:

- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*, and,
- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes.

#### **6.3.4. Findings**

Samples of homogenous materials suspected to contain asbestos were collected and submitted for analysis. Fisher collected fifteen (15) bulk samples of building materials found within the specified work area(s) and that could potentially contain asbestos. Findings of all building materials identified within the specified work area(s) are outlined in further detail below.

##### **6.3.4.1. Sprayed or Troweled Fireproofing and Thermal Insulation**

No indication of sprayed or troweled fireproofing and / or thermal insulation was noted in any of the specified work area(s) during the current survey.

##### **6.3.4.2. Texture Finish**

No texture finish was noted in any of the specified work area(s) during the current survey.

##### **6.3.4.3. Mechanical Insulation**

The previous report confirmed asbestos-containing mechanical insulation in the form of aircell insulation and magnesia block and assumed asbestos-containing mechanical insulation in the form of paring cement, are present at the Site, but not observed within the specified work areas.

##### **6.3.4.4. Acoustic Ceiling Tile**

During the survey, one (1) type of ceiling tile were observed within the specific work areas.

- Ceiling Tile 1 (2'x4' Pinprick with Random Small Fissures)

The previous report confirmed that Ceiling Tile 1 was sampled for analysis. The results of analysis revealed this ceiling tile does not contain asbestos.

##### **6.3.4.5. Plaster / Drywall Joint Compound**

Drywall Joint Compound (DJC) was observed throughout the building. During the current survey, three (3) samples of DJC was collected and submitted for analysis. The results of analysis revealed that the DJC does not contain asbestos.

##### **6.3.4.6. Asbestos Cement Products**

The previous report confirmed asbestos cement products, such as Transite Pipe, are present at the Site, but not observed within the specified work areas.

##### **6.3.4.7. Vinyl Sheet Flooring**

No vinyl sheet flooring was noted in any of the specified work area(s) during the current survey.

#### **6.3.4.8. Vinyl Floor Tile**

During the current survey, one (1) vinyl floor tile was observed within the specified work area(s).

- Vinyl Floor Tile 1 – 12" x 12", White with Black Square Design

The previous report confirmed that Vinyl Floor Tile 1 was sampled for analysis. The results of analysis revealed this vinyl floor tile does not contain asbestos.

#### **6.3.4.9. Other ACM**

##### Cream Caulking

Cream caulking was observed along the joints of the block wall and the door frames in the corridor by the main entrance, the washrooms and around the window frames of the open office area. Three (3) samples of the cream caulking was collected for analysis. The results of analysis revealed that the cream caulking does not contain asbestos.

##### Beige Caulking

Beige caulking was observed along the joints of the block wall and the door frame of the classroom. Three (3) samples of the beige caulking was collected for analysis. The results of analysis revealed that the beige caulking around the door frame does not contain asbestos.

##### Tan Caulking

Tan caulking was observed along the joints of the block walls in the corridor. Three (3) samples of the tan caulking were collected for analysis. The results of analysis revealed that the tan caulking along the joints of the block walls contains 0.5-5% Chrysotile asbestos.

##### Grey Caulking

Grey caulking was observed along the joints of the block walls and the door frames in the office area. Three (3) samples of the grey caulking were collected for analysis. The results of analysis revealed that the grey caulking does not contain asbestos.

#### **6.3.5. Recommendations**

Prior to demolition or any renovation activities, all asbestos-containing materials must be removed from the specified work area(s) in accordance with O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations*, and be disposed of at a MOE licensed landfill in accordance with O. Reg. 558/00 (amending O. Reg. 347, *General – Waste Management*).

Refer to attached Site Plans in Appendix A, which illustrate where the ACM is located within the specified work areas.

Specifically, Fisher recommends the following:

- Provide a copy of this report to contractors bidding on or performing work within the subject work areas;
- Remove the asbestos-containing tan caulking along the joints of the block walls using Type 1 abatement procedures, as outlined in O. Reg. 278/05.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

The presence of ACM should be presumed in locations not accessed during this survey. It is possible that ACM is present at the Site that is not identified in this report. Should additional suspected ACM be discovered, it should be presumed as ACM until sample analysis determines asbestos content.

Due to the limited nature of the current scope of work and the presence of solid building finishes (i.e. plaster or drywall walls and ceilings etc.) in many locations, the full extent of ACM may not be confirmed. Precautions should be taken when dismantling solid wall or ceiling finishes, or any other building surfaces which may conceal potential ACM. Such precautions include, but are not limited to, isolation measures and appropriate personal protective equipment.

#### **6.4. Benzene**

Benzene would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Benzene are warranted at this time.

#### **6.5. Coke Oven Emissions**

Coke oven emissions would not be expected to be present at the Site and were not observed during the current survey. No recommendations for coke oven emissions are warranted at this time.

#### **6.6. Ethylene Oxides**

Ethylene oxides would not be expected to be present at the Site and were not observed during the current survey. No recommendations for ethylene oxides are warranted at this time.

#### **6.7. Isocyanates**

Isocyanates would not be expected to be present at the Site and were not observed during the current survey. No recommendations for isocyanates are warranted at this time.

## **6.8. Lead**

### **6.8.1. General Information**

Lead is a naturally occurring bluish-gray metal found in small amounts in the earth's crust. Most lead in the environment comes from human activities such as burning fossil fuels, mining and manufacturing. Lead is used in the production of batteries, ammunition, metal products (solder and pipes) and X-ray devices.

Lead does not break down but lead compounds are changed by sunlight, air and water. Exposure occurs when eating food or drinking water that contains lead. Deteriorated lead paint can contribute to lead dust. The main target for lead toxicity is the nervous system.

### **6.8.2. Regulations and Guidelines**

The Ontario MOL has not prescribed criteria defining an analyzed sample of bulk material as "lead-containing". Further, the MOL has not established a lower limit for concentrations of lead in paint, below which precautions do not need to be considered during construction projects. However, except for very aggressive disturbance of painted finishes, (e.g., abrasive blasting, torch cutting, or grinding), Fisher believes that a lead content below 0.1% by weight (1,000 ug/g or 1000 ppm) represents a concentration in which the lead content is not the limiting hazard for construction hygiene purposes. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations.

The regulation for the designated substance lead applies to every employer and worker at a workplace where lead is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to lead. Exposure limits for this substance are set at 0.05 – 0.10 mg/m<sup>3</sup> (TWA) depending on the type of lead, and for tetraethyl lead 0.30 mg/m<sup>3</sup> (STEL).

Additionally, in 2011 the MOL revised *Guideline: Lead on Construction Projects* outlining practices that should be followed during construction projects to protect workers' from exposure to lead. This includes the methods and equipment employed in the removal of lead-containing coatings that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **6.8.3. Findings**

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current investigation, no samples were collected for lead analysis.

### 6.8.4. Recommendations

Where any lead-containing materials may be disturbed or removed, Fisher recommends that appropriate lead abatement procedures be used. The lead abatement procedures to be used are determined by the method(s) of disturbance employed. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations. The table below outlines lead abatement operations and associated respirator required, as outlined in Ontario MOL guidelines.

#### Classifications of Lead-Containing Operations and Required Respirator

<b>Type 1 Operations</b> (where concentrations of airborne lead would be expected to be < 0.05 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Removal of lead containing coatings with chemical gel or paste and fibrous laminated cloth wrap</li> <li>• Removal of lead containing coatings / materials using power tool that has an effective dust collection system equipped with HEPA filter</li> <li>• Removal of lead containing coatings / materials using non-powered hand tools other than manual scraping or sanding</li> </ul>	Respirators should not be necessary if general procedures are followed and level of air is less than 0.05 mg/m <sup>3</sup> . However, if worker wishes to use a respirator, a half-mask particulate respirator with N-, R- or P-series filter, and 95, 99 or 100% efficiency should be provided.
<b>Type 2a Operations</b> (where concentrations of airborne lead would be expected to be > 0.05 to 0.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Removal of lead containing coatings / materials by scraping or sanding using non-powered hand tools</li> <li>• Manual demolition of lead painted plaster walls / building components by striking with a sledgehammer or similar tool</li> </ul>	NIOSH APF = 10 Half-mask particulate respirator with N-, R- or P- series filter, and 95, 99 or 100% efficiency.
<b>Type 2b Operations</b> (where concentrations of airborne lead would be expected to be > 0.50 to 1.25 mg/m <sup>3</sup> )	
Not applicable to potential renovation activities.	
<b>Type 3a Operations</b> (where concentrations of airborne lead would be expected to be > 1.25 to 2.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Welding or high temperature cutting of lead-containing coatings or materials indoors or in a confined space.</li> <li>• Dry removal of lead-containing mortar using an electronic or pneumatic cutting device.</li> <li>• Burning of a surface containing lead</li> <li>• Removal of lead containing coatings / materials using power tools without an effective dust collection system equipped with HEPA filter</li> </ul>	NIOSH APF = 50 Full-face piece air-purifying respirator with N-, R- or P- series filter and 100% efficiency. Tight-fitting powered air-purifying respirator with high efficiency filter. Full-face piece supplied-air respirator operated in demand mode. Half-mask or full-face piece supplied air respirator operated in continuous-flow mode.
<b>Type 3b Operations</b> (where concentrations of airborne lead would be expected to be > 2.50 mg/m <sup>3</sup> )	
Abrasive blasting of lead-containing coatings or materials.	NIOSH APF >=1000 Type CE abrasive-blast supplied respirator operated in a positive pressure mode with a tight-fitting half-mask face piece.

Refer to MOL *Guideline: Lead on Construction Projects, 2011*, for details of the Ministry's health and safety guidelines regarding lead.

## **6.9. Mercury**

### **6.9.1. General Information**

Mercury is a naturally occurring metal. It is a shiny, silver-white and odourless liquid. It combines with other elements to form inorganic compounds or salts. Metallic mercury is used to produce chlorine gas and caustic soda, and is used in thermostats and thermometers, fluorescent light bulbs, dental fillings and batteries. Exposure occurs when eating fish or shellfish contaminated with methyl mercury, breathing vapors from spills, incinerators, etc.

The nervous system is very sensitive to all forms of mercury. Exposure to high levels of metallic inorganic or organic mercury can permanently damage the brain, kidneys and developing fetus. Short-term exposure may cause lung damage, nausea, vomiting and diarrhea as well as skin and eye irritation.

### **6.9.2. Regulations**

The regulation for mercury applies to every employer and worker at a workplace where mercury is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to mercury. Exposure limits for this substance are set at 0.025 – 0.01 mg/m<sup>3</sup> (TWA) for all forms of mercury excluding alkyl, and for alkyl compounds of mercury 0.03 mg/m<sup>3</sup> (STEL).

### **6.9.3. Findings**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey.

### **6.9.4. Recommendations**

Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

## **6.10. Silica**

### **6.10.1. General Information**

Silica is a crystalline compound occurring abundantly as quartz, sand, and many other minerals, and used to manufacture a variety of materials, especially glass and concrete. When mining this substance, silica can be deadly when it becomes airborne. If inhaled, silica dust can cause silicosis which can be fatal.

Some of the following industries have a high potential for risk to workers: construction (sandblasting, rock drilling, masonry work, jack hammering, tunneling), mining (cutting or drilling through sandstone or granite), foundry work (grinding, mouldings, shakeout, core room), stone cutting (sawing, abrasive blasting, chipping, grinding), manufacturing and use of abrasives, etc.

### **6.10.2. Regulations**

The regulation for silica applies to every employer and worker at a workplace where silica is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to silica. Exposure limits for this substance are set at 0.05 - 0.10 mg/m<sup>3</sup> (TWA), depending on the type of silica.

Additionally, in 2011 the MOL revised *Guideline: Silica on Construction Projects* outlining practices that should be followed during construction projects to protect workers' from exposure to silica. This includes the methods and equipment employed in the removal of silica-containing materials that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **6.10.3. Findings**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings.

### **6.10.4. Recommendations**

If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to MOL *Guideline: Silica on Construction Projects* for details.

## **6.11. Vinyl Chloride**

Vinyl chloride would not be expected to be present at the Site and was not observed during the current survey. No recommendations for vinyl chloride are warranted at this time.

## **6.12. Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work area(s). No action is recommended with regard to mould.

## 7.0. LIMITATIONS

Fisher Environmental Ltd. accepts responsibility for the competent performance of its duties in executing this assignment within the normal standards of the profession, but disclaims responsibility for consequential damages, if any.

The scope of the survey is based on prior agreement with the client, and the rationale given in this report. The survey findings rely on professional interpretation of selective sampling and analysis. Sample analysis results have been applied to homogenous materials in unsampled locations; it was not within the scope of work to carry out an exhaustive sampling and analysis program. For non-accessible building spaces, the likelihood of the presence or absence of asbestos and other designated substances has been described, but such assessment is not a definitive statement of presence or absence.

This report was prepared for the IBI Group. The scope of services performed may not be appropriate for the purposes of other users, and any use or reuse of this document or its findings or recommendations represented herein is at the sole risk of any other user.

We trust that the information provided in the report meets your current requirements. If you have any questions or concerns, please do not hesitate to contact the undersigned.

Respectfully submitted,

Iqbal Fattah, M.Sc.  
Project Manager

David Fisher, P. Eng., C. Chem.  
Principal

## 1. INTRODUCTION AND REGULATORY REQUIREMENTS

### 1.1 Introduction and Scope

ECOH Management Inc. (ECOH) was retained by The City of Toronto to conduct a reassessment survey for designated substances and hazardous materials at the Finch Yard (Building A Only), located at 1026 Finch Avenue West in Toronto, Ontario (hereafter referred to as the “facility” or the “project area”).

The objective of the survey was to determine the condition of previously identified asbestos-containing materials (ACM), identify and assess the condition of previously-identified designated substances and other hazardous materials, and, if necessary, provide recommendations to assist the City of Toronto in fulfilling requirements to achieve regulatory compliance, as set forth under the Ontario Occupational Health and Safety Act, and enforced by the Ontario Ministry of Labour. This document should be filed as an addendum to the original survey report, which was issued by ECOH in December, 2004.

This designated substances survey report is for management purposes only. It is not intended to be used to establish the presence of designated substances or hazardous materials in building materials prior to demolition or renovation activities. **A pre-renovation/pre-demolition audit of the work area for designated substances and hazardous materials should be conducted prior to any work activities that may disturb building materials potentially containing designated materials or hazardous substances.**

Ms. Naomi Pitcher of ECOH performed the fieldwork on September 26, 2018.

The following designated substances and hazardous materials were included in the re-assessment, if previously identified in the facility:

- |                        |   |
|------------------------|---|
| → <i>Asbestos</i>      | → <i>Benzene</i>                          |
| → <i>Lead</i>          | → <i>Coke Oven Emissions</i>              |
| → <i>Mercury</i>       | → <i>Ethylene Oxide</i>                   |
| → <i>Silica</i>        | → <i>Isocyanates</i>                      |
| → <i>Acrylonitrile</i> | → <i>Vinyl Chloride Monomer</i>           |
| → <i>Arsenic</i>       | → <i>Polychlorinated Biphenyls (PCB)s</i> |
| → <i>Mould</i>         |   |

The following report details the project regulatory requirements, survey and analytical methodologies, findings and recommendations, and survey statement of limitations.

### 1.2 Regulatory Requirements

Regulatory requirements and guidelines applicable to the designated substances and hazardous materials noted above include, but are not limited to, the following:

- Ontario Occupational Health and Safety Act and applicable Regulations made under the Act including;
  - Designated Substances – Ontario Regulation 490/09, and
  - Designated Substance – Asbestos on Construction Projects and in Buildings and Repair Operations – Ontario Regulation 278/05.
- Ontario Environmental Protection Act, and applicable regulations made under the Act.

- General – Waste Management – Ontario Regulation 347
- Waste Management – PCB's – Ontario Regulation 362.
- Canadian Environmental Protection Act, 1999 and applicable Regulations made under the Act, including:
  - PCB Regulations (SOR/2008-273), amended Dec 8, 2011.
  - Ministry of Labour Guideline, "*Lead on Construction Projects*", dated April 2011,
  - Ministry of Labour Guideline, "*Silica on Construction Projects*", dated April 2011.
  - Canadian Construction Association, Standard Construction Document CCA 82, 2004; "*Mould Guidelines for the Canadian Construction Industry*",
  - Environmental Abatement Council of Ontario (EACO) *Mould Abatement Guidelines*, Ed. 3, 2015.
  - Environment Canada Document, "*PCB Identification of Lamp Ballasts Containing PCBs*", EPS 2/CC/2, dated August 1991.
  - Environment Canada Document, "*Handbook on PCBs in Electrical Equipment*" EN 47-310/1988E, dated April 1988.

## 2. SURVEY METHODOLOGY

### 2.1 General Approach

To ensure familiarity with the building, and prior to commencing the survey, the surveyor made reference to previous surveys, facility floor plans, and other available documentation. The surveyor looked for the most common applications of building materials made with Designated Substances based on historical applications. The investigation performed was non-intrusive in nature (i.e. did not include demolition of building systems to verify concealed conditions).

Any rooms that could not be accessed during the survey are noted in the Hazardous Materials Inventory Sheet in Appendix I and on project drawings in Appendix IV.

### 2.2 Asbestos Survey Methodology

#### 2.2.1 Asbestos Sampling Strategy and Analytical Methods

Where sampling was required, bulk samples of potentially asbestos-containing materials were collected for analysis. As per the requirements of Ontario Regulation 278/05, multiple samples (ranging from 3 to 7 depending on quantity and type of material) are required to confirm that asbestos is not present in that given material. Only one positive result (i.e. confirmation of the presence of asbestos) is required to classify a material as asbestos-containing. Therefore, ECOH's sampling strategy involves the collection of sufficient numbers of samples to meet regulatory requirements, followed by instructions to the laboratory to cease analysis of all remaining samples within a series when a sample within that series is determined to be asbestos-containing.

Sampling requires a small volume of material to either be removed from a damaged section of suspect material or cut from intact material, which is then repaired by sealing with tape to prevent fibre release. The collected samples are placed in plastic bags, sealed, and shipped to an independent laboratory. A formal chain of custody procedure is maintained between ECOH and the sub-contracted laboratory during sample transport. Samples are analysed following the analytical procedure prescribed by O. Reg. 278/05 U.S. Environmental Protection Agency Test Method EPA/600/R-93/116: Method for the Determination of Asbestos in Bulk Building Materials. June 1993. Although not required by provincial regulation, all laboratories used by ECOH are accredited

under the U.S. National Voluntary Laboratory Accreditation Program (NVLAP) to ensure consistent, accurate and defensible results.

Materials confirmed to be asbestos-containing during any previous assessments of the facility (if applicable) were not re-sampled for this survey. Additionally, samples were not collected of materials that were previously confirmed to be non-asbestos per the requirements of Ontario Regulation 278/05.

With the exception of window caulking and roofing materials, all other potentially asbestos-containing materials (currently recorded as “assumed to contain asbestos”) were sampled, unless materials were located at heights exceeding the reach of a surveyor using a 6’ step ladder, or were otherwise inaccessible.

Materials assumed or confirmed to contain asbestos in previous years, but not observed during the current survey are retained in the Hazardous Materials Inventory Sheet in Appendix I with a notation that the material was not observed.

### 2.3 Lead Methodology

Where sampling was required (i.e. where damaged materials were observed), bulk samples of potentially lead-containing materials were collected for analysis by flame atomic absorption spectroscopy. The collected samples were placed in plastic bags, sealed, and shipped to an independent laboratory. A formal chain of custody procedure is maintained between ECOH and the sub-contracted laboratory during sample transport. All laboratories used by ECOH are accredited under the U.S. EPA National Environmental Lead Laboratory Accreditation Program (NLLAP) and/or American Industrial Hygiene Association (AIHA) Environmental Lead Laboratory Accreditation Program (ELLAP) to ensure consistent, accurate and defensible results.

Lead concentrations exceeding 1000ppm (0.1%) are considered to indicate the material is “lead-containing” per City of Toronto policy and applicable guidelines.

### 2.4 Mould Assessment

The mould assessment of the project area was conducted in accordance with the Canadian Construction Association, Standard Construction Document CCA 82, 2004; “*Mould Guidelines for the Canadian Construction Industry*”. Although there are no regulatory requirements or guidelines in Ontario for such an assessment, the preceding protocol has become accepted as the industry standard by most experts, consultants, and the Ontario Ministry of Labour.

### 2.5 Assessment for PCBs

PCBs in commercial facilities can be present in high concentrations in fluorescent or HID light fixtures, and electrical transformers.

Neither dismantling the lights to investigate the ballasts, nor dismantling the transformers to investigate their interiors, was part of the scope of this survey. Without disassembly, determination of whether light ballasts are PCB-containing is often very difficult. If no labels are present, all such light fixtures are assumed to contain PCB ballasts.

Electrical transformers are not disassembled for safety reasons. Determination of PCB content relies on the comparison of information on labels and nameplates located on the exterior of the transformer with standard PCB Identifier Code literature. Transformers must be assumed to contain PCBs if the results of that comparison do not clearly and specifically indicate the transformer does not contain PCBs.

## 2.6 Hazardous Materials Survey Inventory

ECOH's surveyor completed a mould, lead and asbestos field data sheet for each room entered. The data sheet contains the room name, a unique room number assigned by the surveyor, the quantity, type and condition of potentially hazardous materials present in the room, and sampling information. The inventory sheet is included as Appendix I.

## 2.7 Survey of Other Hazardous Materials

Materials or equipment suspected of containing other Designated Substances and/or PCBs are identified by appearance, age and knowledge of historic applications.

## 3. FINDINGS AND RECOMMENDATIONS

### 3.1 Asbestos

Confirmed ACM identified within the facility includes the following:

- Vinyl Floor Tile (Non-friable),
- Aircell Insulation (Friable),
- Magnesia Block (Friable), and
- Transite Pipe (Non-friable).

Assumed ACM identified within the facility includes the following:

- Plaster (Non-friable),
- Parging Cement (Non-friable),
- Window Caulking (Non-friable), and
- Roofing Material (Non-friable).

The locations and quantities of materials assumed or confirmed to be asbestos-containing can be found in the hazardous materials inventory sheet, which is included as Appendix I.

Table 1, below, identifies any assumed and/or confirmed ACM observed to be in damaged condition at the time of the reassessment.

TABLE 1 Identified Damaged Asbestos Materials			
Location Number	Location Name	Quantity, Type and Condition of Material	Analytical Result
N/A - All Assumed and/or Confirmed ACM Observed to be in Good Condition at the Time of the Reassessment Survey			

No samples were collected for analysis of asbestos type and content during the current survey.

For the purposes of future renovation and/or demolition activities in specific locations within the facility, any building materials not specifically sampled within the renovation project area should be

treated as if their asbestos content is not known. Such materials should, therefore, be sampled prior to the occurrence of renovation or demolition work.

Additional asbestos-containing materials may be present in areas of the building which were inaccessible at the time of the survey (i.e. above fixed ceilings, behind walls, under flooring, etc.).

### 3.2 Lead

No potentially lead-containing materials were observed to be damaged during the survey, and, therefore, no lead bulk samples were collected.

No significant potential sources of lead or lead-containing products were identified during the survey. However, lead may be present in:

- Ceramic tile glazing
- Internal batteries associated with emergency lighting systems,
- Wiring connectors and electric cable sheathing,
- Piping and solder joints on piping, and
- Cast iron pipe joint packing.

### 3.3 Mould

No mould-affected building materials were observed during the survey.

### 3.4 Mercury

Mercury is present in minor quantities within the project area in the following forms:

- As a vapour within fluorescent light tubes that are present in the project area,
- As a possible constituent of thermostats, and
- As a possible constituent of paints and adhesives.

### 3.5 Silica

Free crystalline silica, in the form of common construction sand, is present in all concrete and masonry products within the building.

### 3.6 Polychlorinated Biphenyls (PCBs)

The following potential sources of Polychlorinated Biphenyls (PCBs) were identified within the facility by ECOH in 2014 (*Survey for Designated Substances and Hazardous Materials* report) and re-evaluated during the current survey. Dismantling lights to investigate ballasts, and/or dismantling transformers to investigate their contents, was not part of the scope of this survey. Therefore, the items listed below must be assumed to contain PCBs, unless specifically stated otherwise:

- Electrical transformers:
  - Transformer Room/Storage (1-19): 1 transformer was observed.
  - Based upon transformer labels/nameplates, it was determined that the above-listed transformer DOES NOT contain PCBs.
- Fluorescent light ballasts:
  - Approximately 100 fluorescent light fixtures are present throughout the facility. Ballasts within these fixtures are assumed to contain PCBs.

Additional mechanical equipment or components of mechanical equipment throughout the facility may contain PCBs. These may include, but are not limited to, electrical capacitors and electrical equipment containing capacitors, voltage regulators, switches, re-closers, bushings or electromagnets,

cable insulation, heat transfer equipment, hydraulic equipment, vapour diffusion pumps, bridge bearings, and caulking and motor/hydraulic oils. A specific assessment prior to the removal of any mechanical equipment within the facility should be conducted to confirm if PCBs are present within the equipment.

### 3.7 Benzene

The following potential sources of benzene were identified within the facility by ECOH in 2014 (*Survey for Designated Substances and Hazardous Materials* report) and re-evaluated during the current survey.

- Electrical transformers:
  - Transformer Room/Storage (1-19): 1 transformer. Disassembly of transformers was not a part of the scope of work for this survey, and therefore it must be assumed that chlorobenzenes are present within the transformers until proven otherwise. PCBs in PCB-based transformers were typically mixed with chlorobenzenes at the time of installation to reduce PCB viscosity.
  - Based upon transformer labels/nameplates, it was determined that the transformers present within the facility do not contain chlorobenzenes

### 3.8 Other Environmental Considerations

The environmental audit also included an investigation for the following compounds, none of which were found to be present:

- |                       |                          |
|-----------------------|--------------------------|
| • Acrylonitrile       | • Ethylene Oxides        |
| • Arsenic             | • Isocyanates            |
| • Coke Oven Emissions | • Vinyl Chloride Monomer |

Please note: paint, adhesives and plastics present throughout the project area may contain trace amounts of Acrylonitrile, Arsenic, Benzene, Ethylene Oxides, Isocyanates, Lead, Mercury and Vinyl Chloride Monomer. However, none of these materials were observed in a hazardous or unsafe condition, unless noted previously in Section 3.

## 4. RECOMMENDATIONS

### 4.1 Asbestos

All assumed and/or confirmed ACM were observed to be in GOOD condition at the time of the reassessment. As such, no corrective actions are recommended at this time.

Ontario Ministry of Labour Regulation 278/05 requires that an Asbestos Management Program (AMP) be implemented as long as asbestos-containing materials are present (or assumed to be present) in a building. The AMP, original survey report and subsequent reassessment reports must be available at the work place, and must identify the type of asbestos, and where asbestos can be found on a room-by-room basis.

**NOTE:** Interpretation of all sources of asbestos-related information, including but not limited to the original asbestos survey report, asbestos reassessment reports, room-by-room survey data, survey drawings and reports from previous asbestos abatement projects, should be completed by a competent person trained in the historical application of asbestos in building materials, building design and preferably by a person with site-specific knowledge and/or experience.

Information contained within any of the above-noted sources may not relieve the Regulatory responsibility of building Owners, or project Employers/Constructors, to complete a detailed site inspection prior to commencement of a project.

This report should not be used as a substitute for a detailed site inspection to identify asbestos-containing building materials, which must be specifically tailored to the scope and nature of any given project, and completed prior to any maintenance, renovation or demolition work that may cause disturbance to building materials.

#### 4.2 Lead

No potentially damaged lead-containing materials were observed at the time of the reassessment. As such, no corrective actions are required at this time.

Renovation, demolition or general construction work involving the removal of materials containing only trace concentrations of lead (i.e. Concentrations below 0.1% (1000ppm) by dry weight) can be completed without lead specific safety precautions provided that:

- a) work does not include 'fume generating activities' (heat producing) such as welding, torching, burning, high temperature cutting, etc.,
- b) work does not include dust-generating activities such as grinding, cutting or chemical stripping,
- c) dust levels are maintained below 3mg/m<sup>3</sup>, and
- d) general health and safety construction procedures are implemented, which would include dust suppression methods, proper respiratory protection (minimum of a 1/2-face respirator) and protective clothing, as is appropriate for the work being completed.

Any work involving the disturbance of building materials assumed to contain lead (e.g. wiring connectors or electric cable sheathing) should be conducted following recommendations detailed within the Ministry of Labour document *Guideline - Lead on Construction Projects*, dated April 2011.

All lead-containing waste materials must be disposed of following requirements set forth in applicable federal and/or provincial regulations, including Ontario Regulation 347: *General – Waste Management*.

#### 4.3 Mould

No mould growth was observed at the time of the reassessment. As such, no corrective actions are recommended at this time.

#### 4.4 Mercury

The presence of mercury within assembled units (e.g. fluorescent light bulbs and thermostat bulbs) should not be considered a hazard provided that the assembled units remain sealed and intact. Avoid direct skin contact with mercury and avoid inhalation of mercury vapour. If required, dispose of mercury following applicable legislative requirements.

#### 4.5 Silica

Silica-containing building materials are present throughout the facility (e.g. concrete, brick, cement block, etc.). Any work involving the disturbance of materials that may contain silica should be

conducted following recommendations detailed in the Ministry of Labour document “*Guideline - Silica on Construction Projects*”, dated April 2011.

#### **4.6 Polychlorinated Biphenyls (PCBs)**

Fluorescent light ballasts and other mechanical equipment throughout the facility are assumed to contain PCBs, as neither dismantling the lights to investigate the ballasts, nor dismantling the transformers to investigate their contents, was within the scope of this survey.

PCB-containing light ballasts may legally remain in use until December 31, 2025, if they were already in use in the facility on September 5, 2008. However, it is ECOH’s general recommendation that PCB ballasts are proactively removed to eliminate the possibility of ballasts rupturing, which can cause the release of high concentrations of PCBs into indoor air for extended periods, and/or result in costly remediation. To determine whether light ballasts contain PCBs, they should be disassembled to observe serial codes and then compared to standard PCB Identifier Code literature. Ballasts with unidentifiable serial codes, or from manufacturers who are not included in the standard PCB Identifier Code literature, or which are not clearly labelled as “PCB Free”, or for which no date is clearly visible (ballasts dated 1981 or later do not contain PCBs), must be assumed to contain PCBs.

Disposal of fluorescent light ballasts that contain PCBs must follow Ontario Regulation 347, General –Waste Management, Ontario Regulation 362, Waste Management – PCB’s, and the amended PCB Regulations, 2008 established under the Canadian Environmental Protection Act, 1999.

Removal of any other PCB-containing substances or equipment in the facility should follow the amended *PCB Regulations*, 2008, made under the *Canadian Environmental Protection Act*, 1999 (CEPA).

#### **4.7 Other Substances**

Dust suppression and personal protection procedures should be implemented during the demolition of materials that may contain Acrylonitrile, Arsenic, Benzene, Ethylene Oxides, Isocyanates, and Vinyl Chloride.

### **5. CORRECTIVE ACTIONS**

Corrective actions are not required.

### **6. STATEMENT OF LIMITATIONS**

Due to the nature of building construction, some limitations exist as to the possible thoroughness of the designated substance and hazardous materials survey. The field observations, measurements and analysis are considered sufficient in detail and scope to form a reasonable basis for the findings and conclusions presented in this report. The findings and conclusions drawn by ECOH, concerning the designated substance and hazardous materials survey, are limited to the specific scope of work for which ECOH was retained and are based solely on information generated as a result of the specific scope of work authorized by The City of Toronto. The results of the designated substance and hazardous materials survey are limited to visual inspection of areas made accessible to ECOH personnel and information obtained from facility personnel, when obtained.

ECOH warrants that the findings and conclusions contained herein have been made in accordance with generally accepted evaluation methods in the industry and applicable regulations at the time of the performance of the designated substance survey. However, there is no warranty, expressed or implied, that this building survey has uncovered all environmental considerations on the subject site

In addition, ECOH cannot guarantee the completeness or accuracy of information supplied by a third party.

This report was prepared by ECOH for The City of Toronto. The material in it reflects ECOH's professional interpretation of information available at the time of report preparation. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties.

## 1.0. EXECUTIVE SUMMARY

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work areas for the Toronto Fire Station 122, located at 2545 Bayview Avenue, Toronto, Ontario, herein after referred to as the "Site". The site inspection and sampling works were conducted on March 7, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

### **Asbestos**

Fisher was provided with the report of a previous DSS, which was conducted by Fisher Environmental Ltd. on October 16, 2014. This report has indicated the only assumed ACM was caulking (windows/doors).

During the current survey, three (3) bulk samples of building materials found within the specified work areas and that could potentially contain asbestos, were collected and submitted to Fisher Environmental Laboratories for Polarised Light Microscopy (PLM) analysis, as outlined in NIOSH Method 9002. The results of analysis revealed that the material sampled does not contain asbestos.

No asbestos-containing materials were identified in any of the specified work area(s). Therefore, no recommendations with regards to ACM are warranted at this time. Provide a copy of this report to contractors bidding on or performing work within the subject work areas.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

## **Lead**

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current survey, one (1) bulk sample of dark green paint found on the door frame was collected for lead analysis and submitted to Fisher Environmental Laboratories for lead analysis. The result of analysis revealed that the dark green paint on the door frames contain lead below the reporting limit for the analytical method used.

Fisher recommends that, prior to the planned renovation work, the removal of lead containing materials found within the specified work area(s), must be conducted using the appropriate lead abatement procedures. Lead abatement procedures to be used are determined by the method(s) of disturbance employed. Refer to *MOL Guideline: Lead on Construction Projects*, for details

## **Mercury**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey. Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

## **Silica**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings. If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to *MOL Guideline: Silica on Construction Projects* for details.

## **Other Designated Substances**

The other Designated Substances would not be expected to be present at the Site. No immediate actions were recommended with regard to acrylonitrile, arsenic, benzene, coke oven emissions, ethylene oxide, isocyanates, and vinyl chloride.

## **Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work areas. No action is recommended with regard to mould.

## 2.0. INTRODUCTION

Fisher Environmental Ltd. ('Fisher') was retained by IBI Group to carry out a survey for the Designated Substances and other potential hazardous materials within specified work areas for the Toronto Fire Station 122, located at 2545 Bayview Avenue, Toronto, Ontario, herein after referred to as the "Site". The site inspection and sampling works were conducted on March 7, 2022.

IBI Group has been commissioned by the City of Toronto to design and implement accessibility upgrades. The scope of the Designated Substances Survey (DSS) was to identify locations and types of designated substances within the building that may be impacted by the planned renovation work, and to provide recommendations for the safe handling or abatement of these materials, if any, prior to demolition.

The purpose of the project is to do the necessary construction and renovation at the locations are outlined on drawings provided by the IBI Group on February 18, 2022.

## 3.0. REGULATIONS

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

The OHSA, R.S.O. 1990, under the Ontario MOL, defines a toxic substance as a biological, chemical or physical agent (or a combination of such agents) whose presence in the workplace may endanger the health and safety of a worker. Sections of the Act that deals with toxic substances are intended to:

1. ensure that worker exposure to toxic substances is controlled;
2. ensure that toxic substances in the workplace are clearly identified and that workers are provided with enough information to be capable of handling them safely; and,
3. provide the general public with access to information about toxic substances used by industry in their communities.

The Act makes provision for a toxic substance to be "designated", where its use in the workplace is prohibited, regulated, restricted, limited or controlled. Designation is reserved for eleven substances that are particularly hazardous, covered under O. Reg 490/09 – *Designated Substances* that was implemented on July 1, 2010, and include Acrylonitrile, Arsenic, Asbestos, Benzene, Coke Oven Emissions, Ethylene Oxides, Isocyanates, Lead, Mercury, Silica, and Vinyl

Chloride. Formerly, regulations for these substances were passed separately and each outlined exposure limits where workers were likely to inhale, ingest and / or absorb the substance.

O. Reg. 490/09 provides a consistent approach to dealing with existing requirements and provisions, and outlines steps required to control worker exposure to these substances, including by inhalation, ingestion, skin absorption or skin contact. Each designated substance has an allowable level of exposure based on a time-weighted average (TWA) limit, and may also have a short-term exposure limit (STEL) and / or ceiling limit (C) assigned to it. TWA refers to the time-weighted average airborne concentration of a biological or chemical agent to which a worker may be exposed in a work day or work week, STEL refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed in any 15 minute period, and C refers to the maximum airborne concentration of a biological or chemical agent to which a worker may be exposed at any time. Refer to O. Reg. 490/09 – *Designated Substances*.

A supplementary regulation regarding control of asbestos exposures in the construction industry has evolved into O. Reg. 278/05 – *Asbestos on Construction Projects and in Buildings and Repair Operations*. The regulation includes a definition of asbestos-containing materials (ACM), requirements for additional training and clearance air testing, procedures for determining materials that meet the definition of ACM and for the use of glove bags, and provisions for varying from measure and procedures set out in the regulation.

In addition to the OHSA and regulations regarding designated substances, the following regulations, guidelines and standards were also taken into account or referenced:

- O. Reg. 213/91 - *Construction Projects* regulated under the OHSA and last amended by O. Reg. 443/09;
- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*;
- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes;
- MOL *Guideline: Lead on Construction Projects*, 2011; and,
- MOL *Guideline: Silica on Construction Projects*, 2011.

#### **4.0. METHODOLOGY**

Fisher followed the protocols outlined in O. Reg. 278/05 for collecting and analyzing bulk samples of materials suspected to contain asbestos. Visual assessment of the material was the primary method of identification with occasional physical contact for the purpose of collecting bulk samples or examining for underlying layers.

Where applicable, samples of suspect materials were collected in order to establish asbestos or lead content. Samples were grouped according to similarity of appearance (“homogeneous”

materials). The frequency at which the samples were collected was sufficient to obtain a general representation of the presence of these materials at the Site. Samples collected are presumed to be representative of respective building materials in-place at the Site. However, due to potential past renovations, alterations, repairs, or phases of construction, it is possible that individual materials may not be representative of samples collected.

Sampling of roofing materials was not part of the current scope of work. Further, sampling of materials found within operating equipment, portable building articles, or generally non-accessible components such as insulation within electrical switch gears, wiring, motors, light fixtures, elevator brakes, fire door cores, etc. was not performed as part of the current survey.

Samples collected during the survey were placed in plastic zip-lock bags which were labeled and submitted for laboratory analysis. Fisher Environmental Laboratories analysed bulk samples for asbestos type and approximate percent content by performing polarized light microscopy (PLM), as outlined in NIOSH Method 9002. Fisher Environmental Laboratories analysed samples for lead content in paint by performing acid digestion followed by Inductively Coupled Plasma (ICP) analysis.

Site Plan(s), indicating specific work area(s), bulk sample locations and any area(s) of asbestos, are included in Appendix A. The laboratory certificate(s) of analysis are included in Appendix B.

## **5.0. REVIEW OF PREVIOUS REPORTS**

Fisher was provided with the report of a previous DSS, which was conducted by Fisher Environmental Ltd. on October 16, 2014, attached in Appendix C. This report has indicated the only assumed ACM was caulking (windows/doors).

Details are provided in the summaries found in the asbestos sections of this report.

## **6.0. FINDINGS AND RECOMMENDATIONS**

### **6.1. *Acrylonitrile***

Acrylonitrile would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Acrylonitrile are warranted at this time.

### **6.2. *Arsenic***

Arsenic would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Arsenic are warranted at this time.

## **6.3. Asbestos**

### **6.3.1. General Information**

Asbestos is the name given to a group of six different fibrous minerals (amosite, chrysotile, crocidolite, and the fibrous varieties of tremolite, actinolite and anthophyllite) that occur naturally in the environment. Asbestos minerals have separable long fibres that are strong and flexible enough to be spun and woven and are heat resistant.

Because of these characteristics, asbestos has been used for a wide range of manufactured goods, mostly in building materials (roofing shingles, ceiling and floor tiles, paper products, and asbestos cement products), friction products (automobile clutch, brake, and transmission parts), heat-resistant fabrics, packaging, gaskets, and coatings. Some vermiculite or talc products may also contain asbestos.

Asbestos fibres may be released into the air by the disturbance of ACM during product use, renovation or demolition work, building or home maintenance, repair and remodeling. In general, exposure may occur only when the ACM is disturbed in some way to release particles and fibres into the air.

### **6.3.2. Friable vs. Non-Friable ACM**

Based on the requirements of O. Reg. 278/05 and due diligence, an asbestos survey and report must be available at any workplace where asbestos exists identifying locations and types of ACM in the building. The survey must include both friable and non-friable materials confirmed to contain asbestos, as well as any other materials which were not sampled but are suspected (presumed) ACM. The term friable refers to material(s) that could be readily reduced to dust or powder when crushed by hand or moderate pressure. Friable materials have a much greater chance of releasing airborne asbestos fibres when disturbed.

In the past, the most commonly used friable asbestos-containing building materials were surfacing materials (e.g. sprayed on fireproofing, texture, decorative or acoustic plaster) as well as thermal insulation. Examples of manufactured asbestos-containing materials include vinyl floor tiles, ceiling tiles, gasket materials, asbestos cement (Transite) pipes or boards, and asbestos textiles. Depending on the above noted formulation, these materials range from non-friable to friable. Although some products are considered non-friable when in Good condition, severe damage or deterioration may cause non-friable materials to generate airborne dust more readily. Severely damaged non-friable materials, or those to be worked on with powered tools, may be considered as friable ACM for abatement purposes.

Examples of common types of ACM by friability include:

- Friable ACM

- Sprayed Materials (or materials installed by roller or trowel), such as fireproofing, thermal insulation, texture finishes, etc.
  - Mechanical Insulation such as boiler and breeching, ductwork, piping, tanks and associated equipment.
  - Plaster
- Potentially Friable ACM
  - Acoustic Ceiling Tiles
  - Vinyl Sheet Flooring
- Non-Friable ACM
  - Vinyl Floor Tiles
  - Asbestos cement (“Transite”) piping or paneling
  - Window Caulking

### 6.3.3. Regulations

Exposure to asbestos is controlled by two Regulations passed under Ontario’s Occupational Health and Safety Act (OHSA), R.R.O. 1990.

- O. Reg. 490/09 – *Designated Substances* regarding asbestos applies to:
  - every employer operating a mine for the purpose of mining, crushing, grinding or sifting asbestos;
  - every employer processing, adapting or using asbestos in connection with manufacturing or assembling of goods or products;
  - every employer engaged in the repair, alteration or maintenance of machinery, equipment, aircraft, ships, locomotives, railway cars and vehicles;
  - every employer engaged in work on a building that is necessarily incidental to the repair, alteration or maintenance of machinery or equipment; and,
  - to those workers of such employers who are likely to be exposed to asbestos.

Exposure limits for this substance are set at 0.1 f/cc (TWA) for all types of asbestos.

- O. Reg. 278/05 - *Asbestos on Construction Projects and in Buildings and Repair Operations* applies to buildings that contain friable and non-friable ACM and to the repair, alteration and/or maintenance of these buildings.

In addition to regulations for controlling work around asbestos-containing building materials there are regulations for packaging, transportation and disposal of asbestos-containing waste:

- O. Reg. 558/00 made under the Ministry of Environment (MOE) Environmental Protection Act, amending O. Reg. 347 - *General Waste Management*; and,

- The Transport of Dangerous Goods Act (TDGA) provides regulations for the transport of asbestos-containing materials and wastes.

#### **6.3.4. Findings**

Samples of homogenous materials suspected to contain asbestos were collected and submitted for analysis. Fisher collected three (3) bulk samples of building materials found within the specified work area(s) and that could potentially contain asbestos. Findings of all building materials identified within the specified work area(s) are outlined in further detail below.

##### **6.3.4.1. Sprayed or Troweled Fireproofing and Thermal Insulation**

No indication of sprayed or troweled fireproofing and / or thermal insulation was noted in any of the specified work area(s) during the current survey.

##### **6.3.4.2. Texture Finish**

No texture finish was noted in any of the specified work area(s) during the current survey.

##### **6.3.4.3. Mechanical Insulation**

The majority of mechanical insulation observed throughout the building are either not insulated or are insulated with fiberglass which is not suspected to contain asbestos.

##### **6.3.4.4. Acoustic Ceiling Tile**

During the survey, two (2) types of ceiling tile were observed within the specific work areas.

- Ceiling Tile 1 (2'x4' Large Uniform Dots); and
- Ceiling Tile 2 (1'x1' Large Uniform Dots)

The previous report confirmed that Ceiling Tile 1 and 2 were sampled for analysis. The results of analysis revealed that both styles of ceiling tiles do not contain asbestos.

##### **6.3.4.5. Plaster / Drywall Joint Compound**

Drywall Joint Compound was not observed within the specific work areas during the survey. Plaster was observed on the walls and ceiling within the specific work areas. The previous report confirmed seven (7) samples of the plaster were sampled for analysis. The results of analysis revealed that the plaster does not contain asbestos.

##### **6.3.4.6. Asbestos Cement Products**

No asbestos cement products, such as Transite pipe or board, were noted in any of the specified work areas during the current survey.

##### **6.3.4.7. Vinyl Sheet Flooring**

No vinyl sheet flooring was noted in any of the specified work areas during the current survey.

##### **6.3.4.8. Vinyl Floor Tile**

No vinyl floor tile was noted in any of the specified work areas during the current survey.

#### **6.3.4.9. Other ACM**

Three (3) bulk samples of asphalt were collected from the parking area and submitted for analysis. The results of analysis revealed that the asphalt does not contain asbestos.

#### **6.3.5. Recommendations**

No asbestos-containing materials were identified in any of the specified work area(s). Therefore, no recommendations with regards to ACM are warranted at this time.

Note: Fire doors, present within the specific work areas, may contain asbestos-containing thermal insulation inside the door panel. Removal of any asbestos containing fire doors, in intake condition, will require Type 1 to abatement procedures, as outlined in O. Reg. 278/05 and dispose of as asbestos waste.

The presence of ACM should be presumed in locations not accessed during this survey. It is possible that ACM is present at the Site that is not identified in this report. Should additional suspected ACM be discovered, it should be presumed as ACM until sample analysis determines asbestos content.

Due to the limited nature of the current scope of work and the presence of solid building finishes (i.e. plaster or drywall walls and ceilings etc.) in many locations, the full extent of ACM may not be confirmed. Precautions should be taken when dismantling solid wall or ceiling finishes, or any other building surfaces which may conceal potential ACM. Such precautions include, but are not limited to, isolation measures and appropriate personal protective equipment.

#### **6.4. Benzene**

Benzene would not be expected to be present at the Site and was not observed during the current survey. No recommendations for Benzene are warranted at this time.

#### **6.5. Coke Oven Emissions**

Coke oven emissions would not be expected to be present at the Site and were not observed during the current survey. No recommendations for coke oven emissions are warranted at this time.

#### **6.6. Ethylene Oxides**

Ethylene oxides would not be expected to be present at the Site and were not observed during the current survey. No recommendations for ethylene oxides are warranted at this time.

#### **6.7. Isocyanates**

Isocyanates would not be expected to be present at the Site and were not observed during the current survey. No recommendations for isocyanates are warranted at this time.

## **6.8. Lead**

### **6.8.1. General Information**

Lead is a naturally occurring bluish–gray metal found in small amounts in the earth’s crust. Most lead in the environment comes from human activities such as burning fossil fuels, mining and manufacturing. Lead is used in the production of batteries, ammunition, metal products (solder and pipes) and X-ray devices.

Lead does not break down but lead compounds are changed by sunlight, air and water. Exposure occurs when eating food or drinking water that contains lead. Deteriorated lead paint can contribute to lead dust. The main target for lead toxicity is the nervous system.

### **6.8.2. Regulations and Guidelines**

The Ontario MOL has not prescribed criteria defining an analyzed sample of bulk material as “lead-containing”. Further, the MOL has not established a lower limit for concentrations of lead in paint, below which precautions do not need to be considered during construction projects. However, except for very aggressive disturbance of painted finishes, (e.g., abrasive blasting, torch cutting, or grinding), Fisher believes that a lead content below 0.1% by weight (1,000 ug/g or 1000 ppm) represents a concentration in which the lead content is not the limiting hazard for construction hygiene purposes. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations.

The regulation for the designated substance lead applies to every employer and worker at a workplace where lead is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to lead. Exposure limits for this substance are set at 0.05 – 0.10 mg/m<sup>3</sup> (TWA) depending on the type of lead, and for tetraethyl lead 0.30 mg/m<sup>3</sup> (STEL).

Additionally, in 2011 the MOL revised *Guideline: Lead on Construction Projects* outlining practices that should be followed during construction projects to protect workers’ from exposure to lead. This includes the methods and equipment employed in the removal of lead-containing coatings that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **6.8.3. Findings**

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. Lead can also be present in various ceramic tiles. During the current survey, one (1) bulk sample of dark green paint found on the door frame was collected and submitted to Fisher Environmental Laboratories for lead analysis. The result of analysis revealed that the dark green paint contain lead below the reporting limit for the analytical method used.

### 6.8.4. Recommendations

Where any lead-containing materials may be disturbed or removed, Fisher recommends that appropriate lead abatement procedures be used. The lead abatement procedures to be used are determined by the method(s) of disturbance employed. Regular construction dust suppression techniques and worker hygiene practices are sufficient for disturbance of paint finishes determined to contain less than 0.1% lead by weight, provided that work is limited to non-aggressive operations. The table below outlines lead abatement operations and associated respirator required, as outlined in Ontario MOL guidelines.

#### Classifications of Lead-Containing Operations and Required Respirator

<b>Type 1 Operations</b> (where concentrations of airborne lead would be expected to be < 0.05 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Removal of lead containing coatings with chemical gel or paste and fibrous laminated cloth wrap</li> <li>• Removal of lead containing coatings / materials using power tool that has an effective dust collection system equipped with HEPA filter</li> <li>• Removal of lead containing coatings / materials using non-powered hand tools other than manual scraping or sanding</li> </ul>	Respirators should not be necessary if general procedures are followed and level of air is less than 0.05 mg/m <sup>3</sup> . However, if worker wishes to use a respirator, a half-mask particulate respirator with N-, R- or P-series filter, and 95, 99 or 100% efficiency should be provided.
<b>Type 2a Operations</b> (where concentrations of airborne lead would be expected to be > 0.05 to 0.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Removal of lead containing coatings / materials by scraping or sanding using non-powered hand tools</li> <li>• Manual demolition of lead painted plaster walls / building components by striking with a sledgehammer or similar tool</li> </ul>	NIOSH APF = 10 Half-mask particulate respirator with N-, R- or P- series filter, and 95, 99 or 100% efficiency.
<b>Type 2b Operations</b> (where concentrations of airborne lead would be expected to be > 0.50 to 1.25 mg/m <sup>3</sup> )	
Not applicable to potential renovation activities.	
<b>Type 3a Operations</b> (where concentrations of airborne lead would be expected to be > 1.25 to 2.50 mg/m <sup>3</sup> )	
Activities that include; <ul style="list-style-type: none"> <li>• Welding or high temperature cutting of lead-containing coatings or materials indoors or in a confined space.</li> <li>• Dry removal of lead-containing mortar using an electronic or pneumatic cutting device.</li> <li>• Burning of a surface containing lead</li> <li>• Removal of lead containing coatings / materials using power tools without an effective dust collection system equipped with HEPA filter</li> </ul>	NIOSH APF = 50  Full-face piece air-purifying respirator with N-, R- or P- series filter and 100% efficiency.  Tight-fitting powered air-purifying respirator with high efficiency filter.  Full-face piece supplied-air respirator operated in demand mode.  Half-mask or full-face piece supplied air respirator operated in continuous-flow mode.
<b>Type 3b Operations</b> (where concentrations of airborne lead would be expected to be > 2.50 mg/m <sup>3</sup> )	
Abrasive blasting of lead-containing coatings or materials.	NIOSH APF ≥ 1000  Type CE abrasive-blast supplied respirator operated in a positive pressure mode with a tight-fitting half-mask face piece.

Refer to MOL *Guideline: Lead on Construction Projects, 2011*, for details of the Ministry's health and safety guidelines regarding lead.

## **6.9. Mercury**

### **6.9.1. General Information**

Mercury is a naturally occurring metal. It is a shiny, silver-white and odourless liquid. It combines with other elements to form inorganic compounds or salts. Metallic mercury is used to produce chlorine gas and caustic soda, and is used in thermostats and thermometers, fluorescent light bulbs, dental fillings and batteries. Exposure occurs when eating fish or shellfish contaminated with methyl mercury, breathing vapors from spills, incinerators, etc.

The nervous system is very sensitive to all forms of mercury. Exposure to high levels of metallic inorganic or organic mercury can permanently damage the brain, kidneys and developing fetus. Short-term exposure may cause lung damage, nausea, vomiting and diarrhea as well as skin and eye irritation.

### **6.9.2. Regulations**

The regulation for mercury applies to every employer and worker at a workplace where mercury is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to mercury. Exposure limits for this substance are set at 0.025 – 0.01 mg/m<sup>3</sup> (TWA) for all forms of mercury excluding alkyl, and for alkyl compounds of mercury 0.03 mg/m<sup>3</sup> (STEL).

### **6.9.3. Findings**

Mercury is presumed to be present in fluorescent light tubes and thermostatic controls. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the current survey.

### **6.9.4. Recommendations**

Prior to the planned renovation work, Fisher recommends that any presumed mercury-containing fluorescent light tubes and thermostats that will be impacted are to be removed and disposed of in accordance with O. Reg. 558/00.

## **6.10. Silica**

### **6.10.1. General Information**

Silica is a crystalline compound occurring abundantly as quartz, sand, and many other minerals, and used to manufacture a variety of materials, especially glass and concrete. When mining this substance, silica can be deadly when it becomes airborne. If inhaled, silica dust can cause silicosis which can be fatal.

Some of the following industries have a high potential for risk to workers: construction (sandblasting, rock drilling, masonry work, jack hammering, tunneling), mining (cutting or drilling through sandstone or granite), foundry work (grinding, mouldings, shakeout, core room), stone cutting (sawing, abrasive blasting, chipping, grinding), manufacturing and use of abrasives, etc.

### **6.10.2. Regulations**

The regulation for silica applies to every employer and worker at a workplace where silica is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to silica. Exposure limits for this substance are set at 0.05 - 0.10 mg/m<sup>3</sup> (TWA), depending on the type of silica.

Additionally, in 2011 the MOL revised *Guideline: Silica on Construction Projects* outlining practices that should be followed during construction projects to protect workers' from exposure to silica. This includes the methods and equipment employed in the removal of silica-containing materials that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

### **6.10.3. Findings**

No sampling for silica was conducted. However, as the building is constructed of concrete, brick and/or block walls with concrete floors, silica is expected to be found within these components of the buildings.

### **6.10.4. Recommendations**

If these materials will be disturbed during the planned renovation work, appropriate precautions should be taken to protect workers from inhaling silica dusts and debris. Refer to MOL *Guideline: Silica on Construction Projects* for details.

## **6.11. Vinyl Chloride**

Vinyl chloride would not be expected to be present at the Site and was not observed during the current survey. No recommendations for vinyl chloride are warranted at this time.

## **6.12. Mould**

During the current survey, no visible mould or favourable conditions for mould growth were observed in the specified work area(s). No action is recommended with regard to mould.

## 7.0. LIMITATIONS

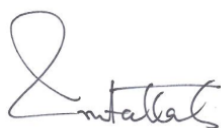

Fisher Environmental Ltd. accepts responsibility for the competent performance of its duties in executing this assignment within the normal standards of the profession, but disclaims responsibility for consequential damages, if any.

The scope of the survey is based on prior agreement with the client, and the rationale given in this report. The survey findings rely on professional interpretation of selective sampling and analysis. Sample analysis results have been applied to homogenous materials in unsampled locations; it was not within the scope of work to carry out an exhaustive sampling and analysis program. For non-accessible building spaces, the likelihood of the presence or absence of asbestos and other designated substances has been described, but such assessment is not a definitive statement of presence or absence.

This report was prepared for the IBI Group. The scope of services performed may not be appropriate for the purposes of other users, and any use or reuse of this document or its findings or recommendations represented herein is at the sole risk of any other user.

We trust that the information provided in the report meets your current requirements. If you have any questions or concerns, please do not hesitate to contact the undersigned.

Respectfully submitted,

Iqbal Fattah, M.Sc.  
Project Manager

David Fisher, P. Eng., C. Chem.  
Principal

## **1. INTRODUCTION AND REGULATORY REQUIREMENTS**

### **1.1 Introduction and Scope**

Fisher Environmental Ltd. was retained by the City of Toronto, Facilities Management to conduct a Designated Substance Survey of building materials in Toronto Fire Station 122 located at 2545 Bayview Avenue in Toronto, Ontario.

The objectives of the Designated Substance Survey (DSS) are to establish locations, conditions and types of designated substances contained within a building and, if necessary, provide recommendations to fulfill requirements set forth under the Ontario Occupational Health and Safety Act (OHSA) to achieve regulatory compliance. Preparation of the DSS report, which includes a brief description of the materials present, and the findings of the DSS, will fulfill the requirements of the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 – Designated Substances and O. Reg. 278/05 – Asbestos on Construction Projects and in Buildings and Repair Operations.

The DSS should also include an examination for the presence of polychlorinated biphenyls (PCBs) and visible mould growth. . This document should be filed as an addendum to the original survey, which was conducted by ECOH Management Inc. on August 1, 2007.

The *Designated Substance Survey* report is intended for management purposes only to demonstrate compliance with regulations. It is not to be used to establish the designated substance content within building materials before renovation or demolition activities. Prior to any work activities that may disturb building materials, a thorough Pre-Renovation or Pre-Demolition survey of the work area for designated substances and hazardous materials shall be conducted. Yvonne Hoogeveen of Fisher Environmental Ltd. performed the fieldwork on October 16, 2014.

## **2. SURVEY METHODOLOGY**

### **2.1 General Approach**

To ensure familiarity with the building, the Surveyor made reference to the previous assessment and reassessment reports provided by the City of Toronto prior to commencing the survey. The Surveyor also made reference to facility floor plans included in the previous assessment reports, or provided independently by the City of Toronto. Facility drawings identifying locations of asbestos-containing materials, if present, are included in Appendix IV. Site photographs are included in Appendix V.

### **2.2 Survey Methodology**

The City of Toronto provided the consultant with the previous DSS report and / or other survey reports of designated substances identified within the facility, if available. . Prior to conducting the DSS, the reports were reviewed by Fisher Environmental Ltd. and updated with all available information regarding ACM, including that from past assessments and reassessments.

The survey was conducted in compliance with the Ontario Ministry of Labour (MOL) regulations for designated substances; O. Reg. 490/09 - *Designated Substances* and O. Reg. 278/05 - *Asbestos*

*on Construction Projects and in Buildings and Repair Operations* made under the Occupational Health and Safety Act (OHSA), R.S.O. 1990.

The Surveyor conducted a visual reassessment of all known and assumed asbestos-containing materials in all accessible areas of the building, as detailed in past survey reports and the Reassessment Survey Form, and recorded the condition (GOOD, FAIR or POOR) of each known or assumed ACM on the Asbestos Reassessment Survey Form. The Surveyor also recorded detailed descriptions of previously-unidentified potential ACM, if observed. Please refer to Appendix I for the updated Reassessment Survey Form.

Materials confirmed to be asbestos-containing during previous assessments were not sampled for this reassessment survey. Additionally, samples were not collected of materials that were previously confirmed to be non-asbestos by the requirements of Ontario Regulation 278/05.

Any other potential asbestos-containing materials noted during the reassessment survey that had not been identified in a previous survey, or were not sampled in accordance with the requirements of O. Reg. 278/05, were sampled as part of the reassessment.

The DSS is based on a walk-through inspection of the facility and shall be conducted room by room to establish locations, conditions and types of designated substances. The survey shall also include an examination for the presence of polychlorinated biphenyls (PCBs) and visible mould growth.

### **3. FINDINGS AND RECOMMENDATIONS**

#### **3.1 Asbestos**

Asbestos fibres may be released into the air by the disturbance of asbestos containing material (ACM) during product use, demolition work, building or home maintenance, repair and remodeling. In general, exposure may occur only when the ACM is disturbed in some way to release particles and fibres into the air.

##### **3.1.1 Findings**

Previously identified assumed ACM include the following:

- Roofing Materials,
- Window Caulking,
- Plaster,
- Drywall Joint Compound, and
- Ceiling Tiles – one (1) variety.

Ceiling Tile 2 (1' x 1' Large Uniform Dot) not identified during previous assessment surveys, was observed in location B-01 Stairwell.

All assumed ACM were observed to be in GOOD condition at the time of the reassessment.

During this reassessment survey, additional samples of readily accessible materials (excluding roofing materials and window caulking) were collected to meet the bulk sampling requirements outlined in O. Reg. 278/05. Table 1 below summarizes the analytical results for the sampled assumed ACM.

<b>TABLE 1</b> Summary of Analysis of Bulk Samples collected and analysed during this reassessment			
<b>Sample Number</b>	<b>Sample Description</b>	<b>Sample Location</b>	<b>Analytical Results</b>
14-9587-01	Plaster	Loc. 1-06, Washroom	None Detected
14-9587-02	Plaster	Loc. 2-01, Lounge	None Detected
14-9587-03	Plaster	Loc. 2-02, Kitchen	None Detected
14-9587-04	Plaster	Loc. 2-02, Kitchen	None Detected
14-9587-05	Plaster	Loc. 2-03, Lockers/Hall	None Detected
14-9587-06	Plaster	Loc. 2-07, Bedroom	None Detected
14-9587-07	Plaster	Loc. 2-08, Dormitory	None Detected
14-9587-08	Drywall Joint Compound	Loc. 2-03, Lockers/Hall	None Detected
14-9587-09	Drywall Joint Compound	Loc. 2-05, Men's Washroom	None Detected
14-9587-10	Drywall Joint Compound	Loc. 2-06, Women's Washroom	None Detected
14-9587-11	Ceiling Tile 2, 1"x1" Large Uniform Dot	Loc. 2-03, Lockers/Hall	None Detected
14-9587-12	Ceiling Tile 2, 1"x1" Large Uniform Dot	Loc. 2-03, Lockers/Hall	None Detected
14-9587-13	Ceiling Tile 2, 1"x1" Large Uniform Dot	Loc. 2-03, Lockers/Hall	None Detected

Laboratory analysis determined each material sampled to not contain asbestos. The laboratory analysis report is included with this report as Appendix II.

### 3.1.2 Recommendations

All generally accessible building materials previously suspected to be ACM were determined to not contain asbestos and no immediate recommendations are made.

Any other building materials suspected to contain asbestos which are not outlined in this report should be assumed to be asbestos-containing until sample analysis determines asbestos content.

Ontario Ministry of Labour Regulation 278/05 requires that an Asbestos Management Program (AMP) be implemented as long as asbestos-containing materials are present in a building. The AMP, original survey report and subsequent reassessment reports must be available at the work place, and must identify the type of asbestos, and where asbestos can be found on a room-by-room basis.

**NOTE:** Interpretation of all sources of asbestos-related information, including but not limited to the original asbestos survey report, asbestos reassessment reports, room-by-room survey data, survey drawings and reports from previous asbestos abatement projects, should be completed by a competent person trained in the historical application of asbestos in building materials, building design and preferably by a person with site-specific knowledge and/or experience.

Information contained within any of the above-noted sources may not relieve the Regulatory responsibility of building Owners, or project Employers/Constructors, to complete a detailed site inspection prior to commencement of a project.

This report should not be used as a substitute for a detailed site inspection to identify asbestos-containing building materials, which must be specifically tailored to the scope and nature of any given project, and completed prior to any maintenance, renovation or demolition work that may cause disturbance to building materials.

### 3.2 *Lead*

Most lead in the environment comes from human activities such as burning fossil fuels, mining and manufacturing. Lead is used in the production of batteries, ammunition, metal products such as solder and pipes, and x-ray devices. Exposure happens when eating food or drinking water that contains lead. Deteriorated lead paint can contribute to lead dust. The main target for lead toxicity is the nervous system.

The regulation for lead applies to every employer and worker at a workplace where lead is present, produced, processed, used, handled or stored and at which a worker is likely to be exposed to lead.

Additionally, in 2004 the MOL issued *Guideline: Lead on Construction Projects* outlining practices that should be followed during construction projects to protect workers' from exposure to lead. This includes the methods and equipment employed in the removal of lead containing coatings that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

#### 3.2.1 Findings

Based on the age of the building, it is possible that lead-based paint and lead plumbing are present within the building. During the current investigation, no samples were collected for lead analysis.

No other indication of lead containing materials was observed during the building audit, with the exception of that which may be contained within batteries.

#### 3.2.2 Recommendations

During the disturbance of any painted surfaces that contain lead, it would be recommended that appropriate procedures and use of respirators be followed to protect workers.

No immediate corrective actions were recommended with regard to lead.

### 3.3 *Acrylonitrile*

Acrylonitrile is used to make other chemicals such as plastics, synthetic rubber and acrylic fibres. Breathing high concentrations of acrylonitrile will cause nose and throat irritation, tightness in chest, difficulty breathing, nausea, dizziness, weakness, headache, impaired judgment and convulsions. These symptoms usually disappear when exposure has stopped. If spilled on the skin,

acrylonitrile will burn the skin and cause blisters and redness. Acrylonitrile is believed to be carcinogenic.

### **3.3.1 Findings**

Acrylonitrile based polymers may have been utilized in the production of some of the building construction materials (e.g. paints, sealants, and adhesives). Although these polymers are generally volatile, they are expected to produce significant acrylonitrile exposure only during or shortly after application of the subject material. If present on site, acrylonitrile would not be expected to be a concern during future renovation or demolition works. Acrylonitrile was not evident in its pure form anywhere within the subject areas of the building.

### **3.3.2 Recommendations**

No immediate corrective actions were recommended with regard to acrylonitrile.

## **3.4 Arsenic**

Inorganic arsenic compounds are mainly used to preserve wood. Organic arsenic compounds are used as pesticides. Arsenic occurs naturally in soil and minerals and therefore may enter air and water. Breathing high levels of arsenic may cause sore throat and irritated lungs. Ingesting high levels of arsenic can result in death. Arsenic is a suspected carcinogenic substance.

### **3.4.1 Findings**

Low levels of arsenic may be contained within paints or coatings utilized on building construction materials, however exposure levels resulting from personal contact are not expected to be significant. Arsenic or arsenic containing compounds were not encountered during the building survey works.

### **3.4.2 Recommendations**

No immediate corrective actions were recommended with regard to arsenic.

## **3.5 Benzene**

Benzene is colourless liquid with a sweet odour. Benzene utilization has historically been associated with solvents, paints, stains, adhesives, and in the manufacturing of various rubber products. While its current use in building materials has greatly decreased due to an increased awareness of associated health concerns, it may still be present in trace quantities in various industrial solvents. Gasoline sold in Canada contains approximately 4% benzene.

Breathing very high levels of benzene can result in death, while high levels may cause drowsiness, dizziness, rapid heart rate, headaches, and unconsciousness.

### **3.5.1 Findings**

While it may be expected, given the age of the building, that the original construction materials utilized did contain some trace levels of benzene, it is likely that any has since volatilized and would not exceed the permissible exposure values. During future renovation or demolition works, it would not be expected to be a concern. No evidence of benzene was noted during the building survey, with the exception of that which may be contained in regular gasoline fuel burning equipment.

### **3.5.2 Recommendations**

No immediate corrective actions were recommended with regard to benzene.

## **3.6 *Coke Oven Emissions***

Coke oven emissions are released during the carbonization of bituminous coal for the production of coke. Exposure routes include inhalation, skin and / or eye contact. Coke oven emissions are potential occupational carcinogens.

### **3.6.1 Findings**

This substance would not be expected to be found in the building. No evidence of the burning of coke was found during the building survey.

### **3.6.2 Recommendations**

No immediate corrective actions were recommended with regard to coke oven emissions.

## **3.7 *Ethylene Oxides***

Ethylene oxide is a man-made chemical used primarily to make ethylene glycol (antifreeze and polyester). Breathing low levels of ethylene oxides for a prolonged period of time causes eye, skin and respiratory irritations, and can affect nervous system. Higher levels of exposure for shorter time produce symptoms that are similar but more severe.

### **3.7.1 Findings**

This substance would not be expected to be found in the building. No evidence of ethylene oxides was found during the building survey.

### **3.7.2 Recommendations**

No immediate corrective actions were recommended with regard to ethylene oxides.

## **3.8 *Isocyanates***

Isocyanates are a family of highly reactive, low molecular weight chemicals. They are widely used in the manufacture of flexible and rigid foams, fibres, and coatings such as paints and varnishes, and elastomers and various building materials (e.g. spray on polyurethane products).

Isocyanates are powerful irritants to the eyes, skin, and respiratory and gastrointestinal tracts.

### **3.8.1 Findings**

Use of isocyanates or isocyanate compounds would not be expected in the building. No evidence of isocyanates was found during the building survey.

### **3.8.2 Recommendations**

No immediate corrective actions were recommended with regard to isocyanates.

### **3.9 Mercury**

Mercury is a naturally occurring metal. It is a shiny, silver-white and odourless liquid. It combines with other elements to form inorganic compounds or salts. Metallic mercury is used to produce chlorine gas and caustic soda, and is used in thermostats and thermometers, fluorescent light bulbs, dental fillings and batteries. Exposure occurs when breathing vapors from spills, incinerators, etc.

The nervous system is very sensitive to all forms of mercury. Exposure to high levels of metallic inorganic or organic mercury can permanently damage the brain, kidneys and developing fetus. Short-term exposure may cause lung damage, nausea, vomiting and diarrhea as well as skin and eye irritation.

#### **3.9.1 Findings**

Mercury can be found in fluorescent light bulbs and building thermostats. Prior to future renovation or demolition works, it would be recommended that these products be safely removed. The disposal of mercury containing items are regulated under the Environmental Protection Act, and it would be recommended that for disposal purposes any mercury containing thermostats and fluorescent light bulbs be disposed of at an MOE licensed receiver. With the exception of fluorescent light bulbs and building thermostats, no other evidence of mercury was noted during the building survey.

#### **3.9.2 Recommendations**

No immediate corrective actions were recommended with regard to mercury.

### **3.10 Silica**

Silica is a crystalline compound occurring abundantly as quartz, sand, and many other minerals, and used to manufacture a variety of materials, especially glass and concrete. When mining this substance, silica can be deadly when it becomes airborne. If inhaled, silica dust can cause silicosis which can be fatal.

Additionally, in 2004 the MOL issued *Guideline: Silica on Construction Projects* outlining practices that should be followed during construction projects to protect workers' from exposure to silica. This includes the methods and equipment employed in the removal of silica containing materials that reduce the creation of dust, providing appropriate facilities for workers to wash after each shift, and providing protective clothing and respirators where necessary.

#### **3.10.1 Findings**

As the building is constructed of concrete block and brick, with concrete floors, silica is expected to be found within these components of the building. During any significant renovation or demolition works where concrete dust is generated, dust suppression techniques should be utilized to control worker exposure to silica. Silica is expected to be present in concrete and masonry products in the building.

#### **3.10.2 Recommendations**

No immediate corrective actions were recommended with regard to silica.

### **3.11 Vinyl Chloride**

Vinyl chloride is used to make polyvinyl chloride (PVC) which is found in a variety of plastic products, including pipes, wires, cable coatings and packaging materials. Breathing high levels of vinyl chloride can cause dizziness, unconsciousness and death. Prolonged exposure causes changes in liver, nerve damage, immune reactions and changes in blood flow.

#### **3.11.1 Findings**

PVC pipe is generally stable and does not allow for the liberation of vinyl chloride, under normal conditions. During future renovation or demolition works, this substance would not be expected to be a concern. Vinyl chloride was not evident in its pure form, anywhere in the subject dwellings.

#### **3.11.2 Recommendations**

No immediate corrective actions were recommended with regard to vinyl chloride.

### **3.12 Polychlorinated Biphenyls (PCBs)**

PCBs are mixtures of synthetic organic chemicals with the same basic chemical structure and similar physical properties ranging from oily liquids to waxy solids. Due to their non-flammability, chemical stability, high boiling point and electrical insulating properties, PCBs were used in hundreds of industrial and commercial applications including electrical, heat transfer, and hydraulic equipment; as plasticizers in paints, plastics and rubber products; in pigments, dyes and carbonless copy paper and many other applications.

PCBs have been demonstrated to cause a variety of adverse health effects. PCBs have been shown to cause cancer.

#### **3.12.1 Findings**

No PCB containing equipment with the potential exception of fluorescent lighting ballasts was observed on site. Fluorescent lighting was observed in use in several areas of the building and inspection of three random light ballasts revealed that they did not contain PCB's. The disposal of PCB containing equipment is regulated under MOE Reg. 558, and it would be recommended that during any ballast replacement works the generated ballasts be evaluated for PCB content, with any PCB ballasts being consolidated and sent for disposal to an MOE licensed PCB receiver under waste class 243D.

#### **3.12.2 Recommendations**

It would be recommended that during any ballast replacement works the generated ballasts be evaluated for PCB content. Any PCB ballasts identified should be consolidated and sent for disposal to an MOE licensed PCB receiver under waste class 243D.

### **3.13 Mould**

Mould contamination inside buildings has become a concern to both building owners and occupants. Exposure to moulds is known to cause a variety of health effects in some people. Many fungal spores are considered to be allergenic to susceptible persons, though individual susceptibility varies greatly.

Elevated levels of indoor mould are usually attributed to the chronic moist conditions due to water leaks, floods or elevated humidity. Under these conditions, already low levels of fungal spores in

air from plants and other sources may multiply on cellulose containing materials such as carpets, wallboards, and wood, and result in mould contamination and, if left untreated, can be destructive to certain building materials.

At present, no Federal or Provincial regulations are in effect with respect to reasonable levels of airborne mould spores and other contaminants inside buildings. Health Canada has provided strategies and guidelines related to some indoor contaminants to assist in conducting indoor air quality investigations in their publication *Indoor Air Quality in Office Buildings: A Technical Guide, 1995*. Health Canada recommends that indoor varieties of airborne mould spores should be qualitatively and quantitatively similar to those varieties found outdoors. The presence of one or more fungal species indoors that are not found outdoors suggests the presence of an amplifier in the building.

An additional resource that places numerical limits on acceptable indoor fungal spores is found in the Calgary Health Region's guidelines for *Fungal Air Testing, Investigation and Reporting* for remediated marijuana grow houses. These guidelines suggest that indoor fungal spores are acceptable if found to be elevated by as much as 2 or 3 times the outdoor measurement, depending on the type of mould spore. Refer to attached guidelines.

The Canadian Construction Association (CCA) has provided guidelines regarding investigation and remediation works in *CCA82 - 2004 Mould Guidelines for the Canadian Construction Industry* to protect the health and safety of workers who may be exposed to mould in the course of building renovations.

### **3.13.1 Findings**

During the current investigation, no visible mould or favourable conditions for mould growth were observed in the surveyed areas.

### **3.13.2 Recommendations**

No immediate corrective action is recommended with regard to mould contamination.

## **4. CORRECTIVE ACTIONS**

No corrective actions were recommended.

## **5. STATEMENT OF LIMITATIONS**

Fisher Environmental Ltd. accepts responsibility for the competent performance of its duties in executing this assignment within the normal standards of the profession, but disclaims responsibility for consequential damages, if any.

The extent of the building survey of asbestos containing materials (ACM) and other designated substances is based on prior agreement of the scope of work with the client, and the rationale given in this report. The building survey findings rely on professional interpretation of selective sampling and analysis. Sample analysis results have been applied to homogenous materials in unsampled locations; it was not within the scope of work to carry out an exhaustive sampling and analysis program. For non-accessible building spaces, the likelihood of the presence or absence of asbestos and other designated substances has been described, but such assessment is not a definitive statement of presence or absence.

This report was prepared for the City of Toronto, Facilities Management. The scope of services performed may not be appropriate for the purposes of other users, and any use or reuse of this document or its findings or recommendations represented herein is at the sole risk of any other user.

We trust that the information provided in the report meets your current requirements. If you have any questions or concerns, please do not hesitate to contact the undersigned.

## 6. SIGN-OFF

We trust that this report meets with City of Toronto requirements and we thank you for the opportunity to be of service. Should you have any questions, please do not hesitate to contact us.

Fisher Environmental Ltd.

## 1. Background

### .1 **Accessibility for Ontarians with Disabilities Act and City's Commitment**

The Accessibility for Ontarians with Disabilities Act, 2005 (AODA) is provincial legislation designed to achieve accessibility for Ontarians with disabilities with respect to goods, services, facilities, accommodation, employment, buildings, structures and premises by January 1, 2025.

In August 2009, City Council adopted and endorsed a 'Statement of Commitment to Creating an Accessible City'. In June 2018, City Council adopted the City of Toronto Corporate Accessibility Policy, which states that the City will ensure accessibility at all its facilities and public spaces.

Refer to Appendix A for the City Corporate Accessibility Policy.

### .2 **Corporate Real Estate Management Capital Accessibility Upgrades Program**

The Corporate Real Estate Management (CREM) Division is implementing an accessibility upgrades program for over 350 City buildings under its management with the intent to complete most of it by the end of 2024.

These buildings will be upgraded to meet the requirements of the latest version of the Toronto Accessibility Design Guidelines (TADG) wherever feasible.

In order to complete the accessibility upgrades at these buildings, CREM is establishing a roster of general contractors under a separate procurement call. The work assignments will be carried out pursuant to a second stage competition process consisting of a tender for a group of five (5) to twenty (20) construction projects, bundled generally by a geographic area.

Depending on the project, the work will consist of major and / or minor renovations to the exterior and interior spaces of existing buildings. The majority of buildings, spaces and sites are currently occupied and operational with a short list of vacancies.

In some cases where a building is planned for other repair, rehabilitation, or renovation work, all scopes will be combined together with the accessibility upgrades in the same tender package for a general contractor.

**The need for new elevators at these buildings was identified as part of the accessibility upgrades. The City of Toronto estimates between 35 – 50 elevators will be required to complete the upgrades.** Refer to Appendix B for the list of 42 addresses, identified as potential candidates for new elevator installations at the time of the RFQ posting. Work continues on accessibility audits and detailed design, therefore this number may be adjusted up or down.

The City of Toronto will direct general contractors selected to deliver accessibility upgrades to procure elevators and associated services defined in this RFQ from the Successful Supplier at the unit pricing negotiated by the City.

**3. Scope of Work and Associated Deliverables**

Please refer to Appendices D, E, F, and G of Part 3 – Technical Specifications and Requirements for Deliverables. The Specifications detail the Scope of Work requirements in detail by type of equipment. The information provided in this section is a summary of requirements only – refer to the Appendices listed for the full requirements of this Request for Quotation.

- .1 The scope of this RFQ is for the provision of unit pricing for the non-exclusive supply, delivery and installation of Elevators and Necessary Equipment for the City of Toronto's Accessibility Upgrades Capital Program to Various Locations, as and when required from the date of award. General contractors selected to deliver accessibility upgrades will procure elevators and all associated services from the Successful Supplier at the unit pricing negotiated by the City under this RFQ.
- .2 The selected Supplier will be required to execute a Contract with the City for the provision of unit pricing for the Deliverables. Subsequently, the selected Supplier will be required to enter into contracts to supply, deliver and install elevators and necessary equipment with general contractors chosen by the City to deliver accessibility upgrades to City buildings. Master Service Agreement between the City and general contractors is included in Appendix I to this Part 3 - Technical Specifications and Requirements for Deliverables. **Suppliers should review the terms and conditions set out in Part 2 (FORM OF AGREEMENT) to understand the Contract being entered into with the City.**

**4. Performance Security – Not Applicable**

**5. Insurance Requirements**

- .1 The Supplier shall comply with all insurance requirements, and all WSIB prior to the execution of the Contract. The Supplier shall bear all costs, expenses, losses and damages of its own and those of the General Contractor and the City, which may arise as a result of the Supplier failing to or delaying in promptly complying with this condition.
- .2 The Supplier agrees to purchase and maintain in force, at its own expense and for the duration of the Contract and as required in any contract with a general contractor, pursuant to this RFQ, the following policies of insurance, which policies shall be in a form and with an insurer acceptable to the City. A certificate evidencing these policies signed by the insurer or an authorized agent of the insurer must be delivered to the City prior to the commencement of services:
  - a) Commercial General Liability provided that the policy:
    - (i) is in the amount of not less than Five Million Dollars (\$5,000,000.00), per occurrence;
    - (ii) adds the City of Toronto as an additional insured;
    - (iii) includes Non-Owned Automobile Liability, Employer's Liability and/or Contingent Employer's Liability, and any other provision relevant to the services;

- (iv) includes a clause which will provide the City with thirty (30) days' prior written notice of cancellation (15 days if cancellation is due to non-payment of premium).
- b) Automobile Liability insurance with a minimum limit of Two Million Dollars (\$2,000,000) for all owned or leased licensed motorized vehicles used in the performance of services.

It is understood and agreed that the coverage and limits of liability noted above are not to be construed as the limit of liability of the vendor in the performance of services. It is also agreed that the above insurance policies may be subject to reasonable deductible amounts, which deductible amounts shall be borne by the vendor. At the expiry of the policies of insurance, original signed Certificates evidencing renewal will be provided to the City without notice or demand.

The successful vendor is responsible for any loss or damage whatsoever to any of its materials, goods, equipment or supplies and will maintain appropriate all-risk coverage as any prudent owner of such materials, goods, supplies and equipment. The successful vendor shall have no claim against the City or the City's insurers for any damage or loss to its property and shall require its property insurers to waive any right of subrogation against the City.

## **6. Delivery**

- .1 The Supplier must deliver the specified Deliverables as per their Quotation without substitution or deviation.
- .2 The Supplier shall provide staff who are qualified to undertake the installation services required under the terms of this RFQ. The Supplier's staff must be certified to maintain, repair, install and set-up the types of equipment and associated parts in Part 5 – Pricing Form.
- .3 Late Delivery, partial shipments or shipment of unauthorized Product may result in the Contract being cancelled.
- .4 The Supplier shall restore all property temporarily removed, damaged, or destroyed during the supply, delivery, and installation, of Deliverables to the reasonable satisfaction of the City or to its previous state and at no cost to the City. The Supplier, before final payment, shall remove all surplus materials and any debris of every nature resulting from its operation and put the site(s) in a neat, orderly condition; thoroughly clean. If the Supplier fails to clean up at the completion of the supply, delivery, and installation of the Products, then the City may do so and charge the Supplier for the costs thereof, or deduct said costs from any monies still owing to the Supplier through the general contractor.
- .5 The Supplier shall furnish all labour, materials, services, supplies, tools, equipment, apparatus, transportation, facilities and incidentals required and perform all operations necessary to accomplish the complete installation of the Deliverables.
- .6 A hard copy packing slip must accompany the products delivered and include at a minimum, the purchase order number, the requisitioner's name and address, a

description of the items delivered complete with serial numbers, part numbers, and quantity shipped.

**7. Substitutions of Deliverables**

- .1 Suppliers must not substitute contract approved product(s), commodity(s) or service(s) without prior written approval from City of Toronto through the approval by the Consultant, on either City of Toronto letter head or City of Toronto originating email. This will be enforced via subsequent tender documents. Any approved substitution must meet or exceed the approved good, approved commodity or approved service to be substituted, at no additional cost to the City of Toronto. Supplier will reimburse all substitution evaluation costs, including labour and testing costs, to City of Toronto PMMD Standards and Specifications Unit.

**8. Warranty**

- .1 Please refer to Part 3 - Technical Specifications and Requirements for Deliverables - Appendix D, Section 1.5

**9. Usage Reports**

- .1 If requested, the Supplier shall demonstrate the ability to provide an electronic Usage Report in MS Excel 2013 or higher version, of invoice details by providing the following report criteria:

Dollar value and usage information by,

- a) Cost Centre
  - b) Location
  - c) Invoice Number
  - d) By quantity
  - e) By elevator type
  - f) By delivery date
  - g) Usage
  - h) Cumulative Total by month or as requested by the City
- .2 The Supplier shall be required to submit to the City of Toronto, "Usage Reports" on a monthly basis, or as requested, within 30 days after the end of each month and 15 days after the Term expiry date based on Part 5 – Pricing Form and the above report criteria. The Supplier shall also provide a cumulative report at the end of the Contract term based on the aforementioned criteria.
  - .3 The City may further request a detailed Usage Report at any time during the Term to verify releases on the Contract. The Supplier will provide the information within five (5) Business Days of request. Usage Reports shall be provided by the Supplier at no cost to the City.
  - .4 **If requested**, a sample Usage Report detailing the criteria noted above should be included by the Supplier. If a sample Usage Report is not included with Bid submission, the Supplier will provide the report within five (5) Business Days of request at no cost to the City. Failure to provide the sample report within the specified period may result in the Supplier being declared Non-Compliant.

**10. Product and Service Specifications**

- .1 The Supplier shall be able to provide the Deliverables within the Greater Toronto Area (GTA) as defined in Appendices D, E, F, and G of Part 3 – Technical Specifications and Requirements for Deliverables.
- .2 The Supplier shall be able to carry out inspections, tests and maintenance tasks in accordance with Part 3 – Technical Specifications and Requirements for Deliverables – Appendix E and F.
- .3 The Supplier shall provide emergency repair Services as and when required during weekends and after Business Hours.
- .4 All work must be performed to the Ministry of Labour requirements and to manufacturer's specification.
- .5 All specifications are minimum requirements that must be met or exceeded. Bids containing one or more items that do not meet or exceed the minimum specifications will be declared Non-Compliant.
- .6 Suppliers must fully complete the Specifications Form in Part 4 – Submission Items by entering “yes”, meaning the Deliverables being quoted meet or exceed the minimum specifications, or “no”.
- .7 Suppliers that do not fully complete the Specification Forms will be declared Non-Compliant.

## 1. General

### 1.1. General requirements

1. Conform to the latest editions of the CAN/CSA B44-19 and its applicable appendices and requirements as amended from time to time;
2. Conform to the latest requirements of all Technical Standards and Safety Authority (TSSA) requirements and all relevant TSSA Rulings; and
3. Conform to 209/01 and all code adoption documents. (Collectively the "Code").
4. Conform to the latest requirements of the City of Toronto Accessibility Design Guidelines (TADG).
5. Install the following equipment:

Building	Bank	Machine Type	Number of Devices
Schedule A	Schedule A	Schedule B	Schedule A

6. all above device(s) are located in the Greater Toronto Area (GTA).

### 1.2. Scope

1. Provide labour, materials, products, equipment, and services necessary for the installation of the elevators in compliance with all relevant codes and barrier free access under Appendix E of the CAN/CSA B44-2019.

### 1.3. Definitions

1. The term "Consultant", as used herein, refers to "IBI GROUP".
2. The term "Owner", as used herein, refers to "City of Toronto".
3. The term "Architect", as used herein, refers to "IBI GROUP".
4. The term "Building", "Site" and "Location" refers to Schedule A.
5. The term "Address" refers to Schedule A.
6. The term "Inspecting Authorities", as used herein, refers to authorized agents of governments charged with the responsibility of carrying out periodic inspections and tests on vertical transportation equipment.
7. The term "Provide" or "provide", as used herein, means to supply and install new equipment.
8. The term NEMA as used herein, refers to the National Electrical Manufacturers Association.
9. The term ADAAG as used herein, refers to ADA Accessibility Guidelines.
10. The term FEO-K1 as used herein, refers to the ASME A17.1, "Safety Code for Elevators and Escalators" codified this key, designated "FEO-K1", as the universal standard key for firefighter's emergency operation.
11. The term LED as used herein, refers to Light Emitting Diodes.
12. The term GUI as used herein, refers to General User Interface.
13. The term LCD as used herein, refers to Liquid Crystal Display.

14. The term USB-KIT as used herein, refers to Universal Serial Bus and KIT represents a set of articles or equipment needed for a specific purpose.
15. The term ANSI as used herein, refers to American National Standards Institute.
16. The term MOL as used herein, refers to Ministry of Labour in Ontario.
17. The term Central Monitoring System as used herein, refers to remote elevator monitoring as described in section 1.52.
18. The term WHMIS as used herein, refers to Workplace Hazardous Material Information System and now the Globally Harmonized System of Classification and Labelling of Chemicals (GHS).
19. The term TSSA as used herein, refers to Technical Standards and Safety Authority.
20. The term UL, CSA and CE as used herein, refers to certification that the product, process and service have been tested according to Canadian or U.S. or European standards and that they comply with the requirements of this standard.
21. The term Optic Series refers to a series of buttons with dual lighting. One light is in the button (halo or on the surface) and another on the braille.
22. The term Schedule 40 pipe refers to a pipe typically made from a low-carbon or mild steel. These steels are typically categorized by having a carbon content less than 2 percent.
23. The term PVC as used herein, refers to polymerizing vinyl chloride.
24. The term "Occupational Health and Safety Act" (OHSA) as used herein, refers to Ontario's legislation for workplace health and safety which deals with the prevention of occupational injury and disease and the Human Rights Code, which often has to be considered in dealing with occupational health and safety issues.
25. The Term "Notice of Project" as used herein, means the Ministry of Labour Training and Skills Development notice submitted prior to starting a project as set out in section 6(1) of the Regulation for Construction Projects, O. Reg 213/91.
26. "Substantial Performance" or "Substantial Completion" shall be the point at which all the new equipment has been installed, inspected and passed by the Inspecting Authorities and the elevators are operating as a group with all required features operational, as per Specification Documents. The Consultant shall certify the Substantial Performance of the work.
27. "Total Performance" per building means when the entire installation is complete as required by the specification documents 14 01 20, 14 20 06, 14 20 16, 14 24 06, 14 24 16 (the "Specifications") and is so certified by the Consultant. Notwithstanding the requirements of Canadian Construction Documents Committee (CCDC), and in addition to the foregoing, Total Performance shall be achieved when the elevator performance is in compliance with Section 14 01 20.1.42.
28. Any terms in the Specifications that are not otherwise defined shall have the definitions as given in the latest edition of the Code CAN/CSA B44-19, including where applicable, the latest supplements, for elevators, dumbwaiters, escalators and moving walks.

1.4. Assignment

1. The Supplier shall not assign any work, payment or other obligation of the resulting contract without the written consent of the Owner.

1.5. Warranty

1. The elevator Supplier shall warrant the materials and workmanship of the installation and will make good any defects not due to ordinary wear and tear or improper use or carelessness that may develop within two (2) years from the date of Substantial Performance of the project.
2. The elevator Supplier shall provide a minimum of quarterly maintenance in accordance with the latest requirement of CAN/CSA B44-2019 for the duration of the Warranty period. The cost for the maintenance shall also be included in the price. Regular time callbacks shall be included.

1.6. Hoarding

1. Provide hoarding for the protection of the public and workers at the site. The hoarding design provided to be approved by the Owner.
2. Install temporary barriers between the hoistways as required by Code.
3. The hoarding shall cover the entire entranceway and should have signage design and verbiage approved by the Owner. If access is required at multiple floors, install the barrier on these floors.
4. Provide a solid barrier with fire retardant properties. Allow access only through a lockable 914.4mm by 1828.8 mm (36"x72") door.

1.7. Removal of equipment

1. The Supplier shall at its own expense remove all unused, replaced equipment and rubbish in the machine room.

1.8. Conduct

1. Supervise your personnel so that they present a neat appearance and their movement in the building is within the requirements of their work.
2. Provide uniforms or other obvious means of identification for personnel.
3. Materials, tools and other equipment shall be stored in areas designated by the Owner where space permits. The Supplier is responsible for equipment storage.
4. Any work (regular or noisy work) shall be performed at times suitable to the Owner and between the hours noted in **Appendix C** and shall be within the limits of the local municipal, city and provincial noise by-law.
5. If work is disruptive to the common areas, then approval of the Owner is required and the work should be provided after hours at no additional cost.
6. The rules and regulation shall be adhered to at all times while work is being performed on site. The Supplier shall endeavor to disseminate the information provided within the guideline to all field personnel and shall, at a minimum, meet or exceed the requirements of the Owner under the guidelines.
7. Parking and storage is not the responsibility of the Owner. The Owner may assist where possible in providing suitable space, but shall not be required to do so.
8. Provide the team members with proper tools and communicating equipment to eliminate loud vocal noises and shouting in the hoistway.
9. Comply with Owner's rules and regulation related to: signing, parking, storage, badges, clothing, music, language, use of facilities, etc...

10. The Supplier shall commit to regularly scheduled meetings with the Consultant and Owner to ensure that the escalator removal is going according to plan. The Supplier shall also provide support to the Consultant and disseminate information regarding the Work as requested and required by the Consultant.
- 1.9. Codes and Ordinances
  1. Supply equipment and do work in accordance with building codes, by-laws, regulations and requirements of the local, provincial and federal authorities in effect at the time of the execution of the work.
  2. Supply equipment and do work in accordance with the latest edition of the Code and any other code, which may govern the requirements of the installation.
  3. Comply with the requirements of the Workplace Hazardous Materials Information System (WHMIS) regarding use, handling, storage, and disposal of hazardous materials.
  4. Prior to submission of the bid and throughout the duration of work, give prompt notification in writing of any regulations or requirements known to be in process that might affect the acceptability of the work.
  5. If changes in codes or regulations result in extra costs, those taking effect subsequent to the date of bid submission shall be treated as an extra to the contract.
- 1.10. Certificates of Inspection
  1. Obtain and pay for certificates of approval and all other necessary permits and inspections.
  2. Prior to Substantial Performance, arrange for and pay for a safety inspection of the equipment by the TSSA.
  3. Submit, prior to Total Performance, the approved safety inspection report.
- 1.11. Materials and Workmanship
  1. Provide all new materials and equipment.
  2. Install equipment in a neat, accurate, workmanlike manner.
  3. Comply with the directives of the Consultant.
- 1.12. Trade Marks
  1. Do not apply any trademarks to the car stations without the permission of the Owner.
- 1.13. Fixture Type and Finish
  1. Provide fixtures and finishes as requested by Owner in **Schedule F**. Also provide 5 complete sets (a set contains two keys) of keys (for each key type) to the Owner during the technical seminar.
  2. Where braille is specified, braille marking must meet the approval of the Owner.
- 1.14. Machine Guarding
  1. Engineer proper machine guarding compliant with municipal, provincial and federal Authority Having Jurisdiction (AHJ) over all moving components located in the machine room.
    1. This includes but is not limited to: governors; exposed armatures; brake arms; exposed electrical and high voltage components; rotating sheaves; exposed ropes;

exposed rope brake or secondary safety brake; selectors; selector tape; secondary sheaves; secondary space with moving or rotating parts; and any other rotating equipment or space considered a pinching, sheering or electrical hazard.

2. Provide inspection ports and access to allow visual inspection without dismantling.
3. Provide components that prevent accidental pinching hazards.
4. Provide equipment and components that can deflect a 68kg (150 lbs) falling object.
5. Paint the components and guards with matching paint to that of the equipment being guarded.
6. Paint all moving parts in bright yellow colour.
7. Submit the design to the Consultant and Owner for review within 14 days from award of contract.
8. Provide an engineer's letter of certification that the guarding provided at the site meets with all the requirements of the AHJ.

1.15. Electrical Diagrams

1. Supply wiring diagrams and data as required for the execution of the work herein described including schematics for speed control, dispatching system, and interface printed circuit boards.
2. Incorporate, as part of the schematic diagrams, a reference index (road map) giving the location of electrical components and wiring interconnections for relay coils, relay contracts, field equipment, integrated circuits and other such devices, so that the position on the schematics of any of these items can be readily determined.
3. Supply, prior to the Total Performance inspection, three prints and one reproducible of the wiring and schematic diagrams revised to show changes that have been made.
4. If changes are subsequently made to the wiring or control, supply an additional two sets of marked-up prints of the schematics and field wiring diagrams showing the changes.
5. The wiring diagrams to be the property of the Owner
6. The wiring diagram shall be laminated and properly mounted on a clip board.

1.16. Maintenance Manual

1. Supply to the Owner prior to the Substantial Performance inspection, a maintenance manual as set out in the maintenance section of the specifications
2. The maintenance manual to be the property of the Owner.

1.17. Operation Manual

1. Supply to the Owner prior to the Total Performance inspection, three sets of manuals describing in detail the operation of the equipment including special features, dispatching sequences, and such items as intercom systems and security systems.
2. Set out in step-by-step form the operation for special features such as firefighter's service, independent service, code blue, emergency power service and special emergency service.
3. Supply, as part of the manual, drawings of operating panels (e.g. car panels, central control consoles) with descriptions of the function of switches and indicators.

4. The operation manual to be the property of the Owner.
- 1.18. Technical Seminar
    1. At the time of Total Performance, arrange with the Owner to provide a seminar for the Owner's staff.
    2. Include in the seminar a complete review of the documentation, operation of the equipment and demonstration of any special features.
    3. Provide to the satisfaction of the Owner training on the use of the building management system when it is supplied.
  - 1.19. Painting
    1. Ensure that machine room floors, machine room equipment, hoistways equipment, oxidizing guide rails, top and bottom of car, pit as well as pit equipment are painted.
    2. Paint with low odor paint products all visible sections of the pit steel. At a minimum, ensure that pit floors, pit hoistways equipment, rusted rails and pit steel are painted with Owner approved low odour, rust resistant paint.
  - 1.20. Operating Environment
    1. Arrange that the equipment be capable of operating normally and within the requirements of the Specifications when the ambient temperature is between 3.5 and 36 degrees Celsius (38 and 97 degrees Fahrenheit).
    2. Arrange that the equipment be capable of operating normally and within the requirements of the Specifications when the supply voltage is within minus 10% and plus 10% of the nominal voltage and the frequency is within 5% of the nominal frequency.
    3. The Current Total Harmonic Distortion (THD RMS Voltage) not to exceed 5.0% as per the IEEE 519 standards for filtering of SCR motor equipment. Where the drive does not meet this requirement, provide harmonic filters to meet this requirement.
    4. Provide all necessary drive adjustments to allow for the operation of the elevators under emergency power condition in the event that the emergency power is not suitable to operate the elevators at nominal or rated speed.
  - 1.21. Acceleration of Work
    1. If the work falls behind the schedule submitted to the Owner, take action as necessary to meet the schedule, including, but not limited to, extra personnel and overtime work.
    2. Pay any costs associated with this action unless the delay is caused by acts of government, civil commotion, malicious mischief, act of God or any cause beyond the control of the Supplier.
  - 1.22. Test Data Form: Elevator
    1. After completion of the work, and prior to Substantial Performance, submit a test data form certifying that the unit is complete and ready for inspection. Where the Owner has provided a specific data sheet (usually in the maintenance contract) populate said data sheet.
    2. Arrange that the person responsible for the performance of the work sign this form.
    3. Include a check list of the items in the Specifications as well as other performance data such as door times, operating times, starting, running, stopping currents and voltages, and in general, settings of any adjustable devices.

4. List on this form safety devices, together with their settings and indicate whether they have been checked and adjusted.
- 1.23. Inspection of Elevators
    1. The Consultant will make an acceptance inspection of each elevator after the government inspection test and before the elevator is put into service for the public. The Supplier shall assist the Consultant in the inspection.
    2. The Consultant will make an acceptance inspection of the complete elevator group and all group functions. The Supplier shall assist the Consultant in the inspection.
  - 1.24. Generic Maintenance
    1. Arrange that the equipment can be maintained and adjusted by any competent elevator company without the use of proprietary tools, information or equipment or, if such tools, information or equipment are required, provide them.
    2. Do not incorporate any running time, cycle counters or trip counters that would cause the equipment to shut down or alter its operation in any way.
    3. Provide evidence that all parts needed to maintain and operate the elevating device(s) are available and can be ordered directly by the competition. Provide an affidavit of such claim as well as all supporting documents (catalogue), phone numbers, etc...
    4. Provide all parts including motherboards at a non-exchange basis (i.e. the boards do not have to be exchanged to be secured). All parts shall be made available for purchase and be made available at commercially reasonable and competitive rates.
    5. Provide all required laptops, computers and tools (including adjuster dongles and Bluetooth connectors to allow for adjusting and troubleshooting). Where training is required to provide such access, provide the training.
    6. Provide training on demand (price for training shall be at commercially reasonable and competitive rates) to include adjusting and troubleshooting as well as setting up drives, landing systems, control features, encoders, floor tables, etc...
  - 1.25. Non-Proprietary
    1. All control equipment shall be non-proprietary.
    2. Proof of non-proprietary shall be given in writing and documentation such as brochures and instruction manuals shall accompany the bid pricing.
    3. Supplier shall submit to the Owner proof substantiating the claim of non-proprietary equipment status.
  - 1.26. Diagnostic
    1. Provide non-proprietary diagnostics.
    2. The control system shall provide comprehensive means of accessing the computer memory for elevator diagnostic purposes.
    3. The controller shall have permanent indicators for important elevator statuses as an integral part of the controller.
    4. Any tool required to change parameters such door dwell timing, nudging, securing floors etc. shall be included with the control equipment.

- 1.27. Temporary Group Controller:
  1. Not needed.
- 1.28. Installation Flow Chart Schedule
  1. Assign two teams to perform the installation.
  2. Removal of a team during the installation is forbidden and prohibited unless approved by the Owner. Failure to keep the teams on site is considered a breach of contract and is subject to financial remedies by the Owner.
  3. Provide the Owner and Consultant with an installation flow chart. The flow chart should consist of the following:
    1. The starting date.
    2. The sequence of the installation procedures.
    3. The length of time required to complete each of the procedures.
    4. Length of time to complete the first car and each car thereafter.
    5. The completion date.
  4. Following the award letter of intent, provide a complete technical brief on the mechanical and electrical requirements as well as heat dissipation and reactions
  5. Under no circumstances shall either party be liable for any loss, damage or delay due to any cause beyond either party's reasonable control, including but not limited to acts of government, strikes, lockouts, labour disputes, fire, explosion, theft, weather damage, flood, earthquake, riot, civil commotion, war, mischief or act of God.
  6. In no event shall the Supplier have any liability for loss of profits, loss of business revenue, failure to realize expected savings, other commercial or other economic loss of any kind whatsoever or for any indirect, special or consequential damages.
  7. If there is any delay beyond the Supplier's reasonable control or a delay caused by the Owner, the penalty outlined in the general conditions shall not apply for the delay period.
- 1.29. Conflict Resolution
  1. Any disputes related to this contract shall be resolved utilizing an alternative dispute resolution by a mutually accepted arbitrator to be chosen by the Owner and the Supplier take out period within thirty (30) days after written notice by one of the parties demanding binding arbitration.
  2. Neither one of the parties may unreasonably withhold consent to the selection of an arbitrator, and the Owner and the Supplier will share the cost of the arbitrator equally.
  3. By mutual agreement, however, the Owner and the Supplier may postpone arbitration until both parties have completed some specified but limited discovery about the dispute. The parties may also agree to replace arbitration with some other form of binding alternate dispute resolution procedure.
- 1.30. Venue, Jurisdiction, and Jury Waiver
  1. The venue of any judicial proceedings shall be in the city of Toronto unless otherwise agreed by the Parties. Each Party irrevocably submits to the exclusive jurisdiction of the federal and provincial/territorial courts located in Toronto unless otherwise agreed by the

Parties. Each Party waives to the fullest extent permitted by law, trial by jury of all Disputes arising out of or relating to this agreement.

1.31. Attorneys' Fees

1. If legal action, including an alternative dispute resolution process, is necessary by either Party to enforce or interpret this agreement or resolve a Dispute arising hereunder, the prevailing Party shall be entitled to recover reasonable attorneys' fees and costs, including fees on any appeal.

1.32. Waiver

1. No waiver of the terms, provisions, conditions and covenants of this agreement shall be binding and effective unless the same shall be in writing signed by the Parties. A waiver of any breach of the terms, provisions, conditions and covenants of this agreement shall be for that one time only and shall not apply to any subsequent breach.

1.33. Energy Saving

1. The Supplier shall provide supporting document evidencing that the proposed solution (hydraulic, MRL, etc...) is more energy efficient than the alternative.

1.34. Words

1. No change or modification of the Contract shall be valid unless it is in writing and signed by the Supplier and the Owner.

1.35. Additional or Hidden Costs

1. The Owner through this Tender, hopes to identify and price all costs associated with the installation. Therefore, any additional or hidden costs that the elevator Supplier is aware of must be identified.
2. Include as part of your tender over-time hours for the following or for any other similar tasks needed to complete the installation:
  1. Testing of the fire recall, emergency power and service once the elevators are turned over;
  2. Loading and transporting of material to the machine room or floors if such work is disruptive to building common areas or space after building occupancy.
  3. Transferring of hall call riser after building occupancy;
  4. Rewiring of dispatcher after building occupancy; or
  5. Removal of two or more cars out of group service after building occupancy.

1.36. Workplace Safety and Insurance Board Coverage

1. The Supplier clearly understands and agrees that it is not, nor is anyone hired by it, covered by the Owner under the Workplace Safety and Insurance Act S.O. 1997, c16, Sch.A, as amended and the Supplier shall be responsible for and shall pay all dues and assessments payable under the Workplace Safety and Insurance Act, the Employment Insurance Act, S.C. 1996, c23 or any Act, whether provincial or federal, in respect of itself, its employees and operations, and shall furnish the Owner, if requested, with such satisfactory evidence that it has complied with the provisions of any such Acts. If the vendor fails to do so, the Owner shall have the right to withhold payment of such sum or sums of money due to that would be sufficient to cover its default and the Owner shall have the right to pay same.

2. The Owner is not the employer of the Supplier or its personnel under any circumstances whatsoever.
- 1.37. Non-Compliance
1. This agreement may be terminated without notice by the Owner upon non-performance of Contract terms; however, in doing so, the Owner does not waive its right to rely upon any obligations or commitments agreed to by the Supplier as part of this Contract. Specifically, the Supplier will be liable for the Owner's acquisition costs (including but not limited to administrative costs) exceeding the contract price required to obtain an alternative Supplier.
  2. Where there is a question of non-performance, payment in whole or in part may be withheld at the discretion of the Owner. This action shall not prevent the Owner from taking early payment discounts otherwise applicable.
- 1.38. Security System
1. Assist the security contractor access the elevator car operating station, car top and provide wiring and power to re-install security cameras in the elevators at no additional charge.
- 1.39. Security Card Access
1. Assist the security contractor access the elevator car operating panels and car top and provide wiring and power to install card access in the elevators at no additional charge.
  2. Provide all needed assistance and support to install card access systems in the elevators. Provide required boards or interfacing hardware to track users and identify which buttons were activated.
- 1.40. Hoistway Access by Others
1. The contractor shall assist the Owner and its representative by providing access to the elevator hoistway so that installation of the life support systems can be expedited at no additional cost to the Owner.
- 1.41. Performance
1. The purpose of this installation is to increase reliability and maintain the elevator performance. Notwithstanding any CCDC-2 requirements or other contractual terms and conditions to the contrary, the elevator installation shall not be considered complete unless:
    1. The elevators are performing in accordance with the specifications and performance table in 14100;
    2. The callback ratio is 0.25 call per elevator per month;
    3. Each individual elevator does not exceed two callbacks per Quarter; and
    4. Not more than one elevator is shutdown at a time.
  2. The Supplier shall demonstrate compliance with the conditions noted in Section 1.41.1, 90 days immediately prior to the date of claimed Substantial Performance. If the required performance was not achieved in the 90 days immediately prior to claimed Substantial Performance, then the contract shall be extended for an additional 120 days subsequent to that to demonstrate reliability.

3. If the Supplier can demonstrate that there were any extraordinary or extenuating circumstances which prevent it from meeting the specifications, the Owner and Consultant may, in their sole and absolute discretion, choose to waive their rights to rely upon the above terms and conditions.
- 1.42. Eco Friendly Alternative
  1. The City of Toronto is interested in the use of eco-friendly alternatives wherever possible. Conventional oils are expected to be used wherever the alternatives are not possible provided that sufficient justifications are provided.
- 1.43. Remote Elevator Monitoring System
  1. Where the elevator controller is provided, ensure that the elevator system can support remote elevator monitoring that meets the intent of the following specifications:
    1. Provide either a communications protocol that communicates to Solucore board and exchanges the information related to the operation, status and error logs from the elevator; or
    2. Provide 13 dry contacts and terminate on a terminal blocks located on top of the controller. Provide the following dry contacts: run, shutdown, up, down, maintenance, close limit, open limit, phone button, inspection, independent service, and power failure. provide a top call and bottom call inputs.
- 1.44. Singular or Plural
  1. Where words are used in the singular, the Supplier shall not assume that it refers to one item and it is incumbent on the Supplier to qualify that only the singular was assumed. If the Supplier does not provide the clarification, it shall be assumed that the price shall include the installation of equipment.
  2. Provide pricing to perform all the work in accordance with industry standards and as approved by the Consultant. Where the cost carried to perform singular work had been assumed, the Supplier shall clarify the cost carried herein the clarification document.
    1. Example of singular and plural wording includes but is not limited to:
      - (a) Replacing one hall risers where two risers needed (rear entrance);
      - (b) Replacing one car station when the elevator has two (main and auxiliary) stations;
      - (c) Replacing the front door locks in the elevator shaft but not replacing the rear ones;
      - (d) Providing a car buffer but not the counterweight buffer because the specification referenced a buffer and all buffers;
      - (e) Replacing one compensating chain when the site has two compensating chains;
      - (f) Replacing the front buttons but not the rear buttons;
      - (g) Replacing a door operator or an infrared detector but the elevator has two door operators (front and rear);
      - (h) Other examples would include position indicators, car directional arrows, car and counterweight governors, etc...

2. The Supplier shall not omit any work unless CLEARLY noted in the qualification document. The Consultant shall assume that singular and plural work will be performed.
  3. The Supplier shall omit the work when the Consultant specifically indicates that the work is not required. An example of such clarifications would include:
    - (a) Replace the front door operator only;
    - (b) Provide a singular riser only;
    - (c) Delete the auxiliary car station;
    - (d) Retain the counterweight governor;
    - (e) Etc...
- 1.45. Notice of Project
1. The Supplier must provide a Notice of Project to the Ministry of Labour (MOL) prior to starting the project as set out in section 6(1) of the Regulation for Construction Projects, O. Reg. 213/91.
  2. Provide a copy of the Notice of Project, sign and post it in a conspicuous place at the site for review by the Consultant and a Ministry of Labour inspector.
  3. Where applicable, ensure that each subcontractor on the project provides a completed approved registration form.
  4. A Supplier who submits a report under subsection 51 (1) of the Act (notice of death or injury) or gives a notice under section 52 or 53 of the Act (notice of accident, etc.) shall also provide, within 14 days after the occurrence, a professional engineer's written opinion stating the cause of the occurrence.
  5. Post in a conspicuous place at the project, and keep posted while work is done, a notice setting out:
    1. The Supplier's name, and if the Supplier carries on business in a different name, the business name.
    2. The address and telephone number of the Supplier's head office or principle place of business in the province or territory.
    3. The address and phone number of the nearest office of the Ministry.
    4. Within 48 hours of selection for a project, the name, trade and employer of each health & safety representative (H&S Rep) or joint health and safety committee member (JHSC).
  6. Appoint a supervisor for each project with 5 or more workers working at the same time.
  7. Establish written emergency procedures and ensure that they are followed in case of an emergency; Post them in a conspicuous place at the project; review them with JHSC or H&S Rep as applicable.
  8. Ensure that each worker has ready access to a telephone or other system of two-way communication system on the project in the event of an emergency.
  9. Keep records required by this regulation for at least one year after the project completion.

10. The Supplier shall keep the design of a horizontal life line system at the project while the system is in use.
  11. The Supplier shall keep the design drawings on the project while the hoisting and rigging system is being used.
  12. The Supplier shall give notice to the Ministry office located nearest the project, in person, by telephone, by fax or by electronic means before the first multi-tiered load hoisting operation is started at a project.
  13. The Supplier shall make available to an inspector upon request a copy of the certification by the professional engineer who would have verified and certified the results of a test on the structural components of a scaffold and the corresponding rated load of the scaffold.
  14. The Supplier shall keep at a project the design drawings and the written statement for a scaffold, while the scaffold is erected, for scaffolds designed by a professional engineer.
  15. The Supplier shall keep a copy of the design drawings and the required statement on a project while the suspended scaffold or suspended platform that is subject to the requirements of the section is on the Project.
  16. The Supplier shall,
    1. Ensure that written measures and procedures for complying with this section are established and implemented, so that workers are adequately protected from electrical shock and burn; and
    2. Make a copy of the written measures and procedures available to every employer on the project.
- 1.46. Errors and Omissions
1. While the Consultant has used considerable effort to ensure an accurate representation of information in this Request For Quote (RFQ), the information contained in the RFQ is supplied solely as a guideline for Suppliers. The information is not guaranteed nor warranted to be accurate by the Consultant, nor is it necessarily comprehensive or exhaustive. Nothing in the RFQ is intended to relieve the respondents from forming their own opinions and conclusions with respect to the matters addressed in the RFQ.
- 1.47. Equipment Identification
1. Each elevator in the building shall be assigned with a unique alphabetic, numeric, or alphanumeric identification. The identification assigned shall be a minimum of 50 mm (2 in.) in height and have a contrasting colour to its background. The following but not limited to, should be identified in the form of painting, engraving, or securely attached:
    1. Driving machine
    2. Motor
    3. Governor
    4. Controller
    5. Disconnecting means
    6. Crosshead (visible from landing)
    7. Car operating panel (min 13 mm / 0.5 in.)

8. On both door jambs of every elevator entrance at the designated level, alternate level, the level where means necessary for test i.e. access switches (top & bottom).
9. Buffers or pit channel (visible from the pit access door landing)
10. All other locations where testing, inspection is performed.

1. General

1.1. General Requirements

1. Conform to section 14 01 20.

1.2. Number of Elevators

1. Provide elevator(s) in accordance with Schedule A.

1.3. Device Type: Hydraulic

1. Provide hydraulic equipment for each site identified and where noted in Schedule B.

1.4. Arrangement

1. Provide elevator(s) arranged to operate in accordance with the Bank requirement noted in Schedule A.

1.5. Designations

1. The elevators are numbered in numerical order as required by the Architect.

1.6. Drive Method

1. Arrange all cars in standard cantilevered above ground arrangement.

1.7. Speed

1. The contract speed for all elevators should be 100 fpm.

1.8. Capacity

1. Provide for capacity of 954kg (2100 lbs) on all cars.

1.9. Openings and Stops

1. The elevators should be arranged to serve the floors outlined in Schedule B.

1.10. Dimensions

1. Provide equipment to suit the hoistway, overhead and pit dimensions as per the attached Drawings.

Hydraulic Elevator	Information Location
Hoistway Width per car	Schedule C
Hoistway Depth per car	Schedule C
Pit Depth	Schedule C
Cab height	Schedule C
Elevator Speed	100 fpm
Overhead (top landing to slab)	Schedule C

1.11. Door Type

1. Provide single slide, horizontal sliding car and hoistway doors.

1.12. Door Entrances

1. Provide 915mm (36") wide by 2133.6mm (84") high doors.

1.13. Related Work

1. All work by others shall conform to governing codes. Any other work required to complete the installation or satisfy the regulatory authorities and not specifically listed herein shall be the responsibility of the elevator Sub-contractor. To complete the elevator installation, the following items must be performed or installed by trades other than the elevator Sub-contractor:

1. Provide suitable machine room ventilation to maintain the machine room temperature between 10° Celsius and 30° Celsius.
  2. Provide a fused disconnect switch or circuit breaker for each elevator, with feeder branch wiring to each controller. The switches and size of wires to conform to the Canadian Electrical Code. The disconnect switches are to be mounted in a code approved location.
  3. Provide a 120 volts, AC, 15 amps fused, single-phase power supply with a fused disconnect switch for each elevator, with feeder wiring to each controller for car lights. Location to be in a code approved location.
  4. Provide a separate single-phase power supply of the same voltage as each elevator supply, with 15 amps fused disconnect switch.
  5. Provide suitable machine room lights, and convenience outlets in the machine room. The light switch is to be mounted in a code approved location.
  6. Provide machine room and building smoke detector wiring to the elevator controllers.
  7. Provide wiring and contacts to the elevator controllers for the operation of the special emergency service and emergency power as required by code.
  8. Only where applicable, the wiring for elevator security including camera, card readers, hands-free phone, lobby control panel and central elevator monitoring will be terminated in the machine room. The wiring from that hoistway location to the termination point is work by others. The termination point will be the lobby panel, security desk, monitoring station or remote hall station.
  9. Provide a separate 120 volts, AC, 15 amps fused, single phase power supply to each elevator monitoring and control system.
  10. Provide a signal from the emergency power generator to indicate that the power will be switched from emergency generated to utility generated power.
  11. Perform any cutting, patching and painting for the installation of the hall buttons, hall lanterns, position indicators and main floor monitor panel.
  12. The contractor to provide the hoistway divider steel beams (where applicable) and the machine room hoist beam.
  13. Provide suitable pit lights, and convenience outlets.
  14. Provide dedicated ground wiring.
  15. Where required, a safe pathway/catwalk needed with handrails as per the MOL requirements for building rooftops with a low parapet of less than 42".
- 1.14. Changes in Material and Work
1. Any change or substitution in the approved equipment must have prior written approval from the Owner and Construction Manager.
  2. Any changes in the approved work must have prior written approval from the Owner and Construction Manager.
- 1.15. Cutting, Patching and Other work
1. Any cutting, patching, painting or other restorative work required to accommodate the installation of the new equipment not specifically listed herein as work by others, shall be the responsibility of the Sub-contractor.

2. Prior to proceeding with any such work the Sub-contractor shall obtain approval from the Owner and Construction Manager.
- 1.16. Remote Conduit and Wiring
    1. Where provided, any remote conduit and wiring required to interconnect the elevator controllers and the lobby panel, elevator remote monitoring or an elevator management control system, or any other equipment provided under these specifications, and not specifically listed herein as being by others, shall be the responsibility of the Sub-contractor.
    2. Portions of this work may be sub-contracted with approval of the Owner and Construction Manager.
    3. The Sub-contractor is responsible for providing all wiring needed for remote wiring to the lobby panel or security desk.
2. Machine Room
    - 2.1. Motors
      1. Provide a self-contained unit consisting of the following items:
        1. Oil reservoir with tank cover capable of supporting 200 lbs and controller compartment with cover.
        2. An oil hydraulic pump.
        3. An electric motor.
        4. Oil control unit to comply with hydraulic valve specified.
        5. Pump: Positive displacement type pump specifically manufactured for oil-hydraulic elevator service
          - (a) Pump shall be designed for steady discharge with minimum pulsation to give smooth and quiet operation.
          - (b) Output of pump shall not vary more than 10 percent between no load and full load on the elevator car.
      2. The drive shall be by direct coupling with the pump and motor submerged in the oil reservoir. Drive type shall be determined based primarily on the load on the car, travel, and speed.
      3. The motor shall be specifically designed for a heavy duty oil-hydraulic elevator service. Duty rating shall comply with specified speeds and loads.
      4. Power controller shall contain electrical contactors, electro-mechanical switches and thermal overload relays. Mount components in a NEMA 1 enclosure.
      5. Logic control system shall be microprocessor based and protected from environmental extremes and excessive vibrations.
      6. Provide a solid state soft starting device to comply with specification below.
      7. Provide new hydraulic oil.
      8. Provide a system rated for over 80 starts an hour.

2.2. Hydraulic Valve

1. Provide a new EECO or Maxton valve. Provide a valve that includes pressure sensing device to allow the valve to operate at the same speed in both directions.
2. Install new schedule 40 piping to accommodate for the installation of the new valve.
3. Provide a bi-direction two speed valve.
4. A control section including control solenoids shall direct the main valve and control:
  1. Up and down starting.
  2. Acceleration.
  3. Transition from full speed to levelling speed.
  4. Up and down stops.
  5. Pressure relief.
  6. Manual lowering.
5. All of these functions shall be fully adjustable for maximum smoothness and to meet contract conditions.
6. Relief valve shall be externally adjustable and be capable of bypassing the total oil flow without increasing back pressure more than 10 percent above that required to barely open the valve.
7. Provide a valve with pressure compensation for constant down speed control. This modification of the down piston assembly delivers constant Down Speed Control between no load and full load conditions.
8. Provide a certified valve that can operate reliably between 90 psi minimum and 800 psi maximum.
9. Provide a certified valve that can operate reliably between a temperature range of 80<sup>0</sup> F (27<sup>0</sup> C) minimum, 150<sup>0</sup> F (65<sup>0</sup> C) maximum.

2.3. Controllers

1. Provide non-proprietary microprocessor controllers designed to give the required operation as herein specified.
2. Mount panels securely on substantial, self-supporting steel frames designed for floor or wall mounting.
3. Provide completely enclosed controllers with covers.
4. Install wiring on the controllers, whether control or field wiring, in a neat workman like manner.
5. Mark relays, contactors, fuses, printed circuit boards and other components clearly and permanently with designations as shown on the schematics.
6. Mount the designations for plug in components on the controller adjacent to the components.
7. Where required, provide an interface for a Central Monitoring System.
8. Provide non-proprietary diagnostics tools.

9. The control system shall provide comprehensive means of accessing the computer memory for elevator diagnostic purposes.
10. The controllers shall have permanent indicators for important elevator statuses as an integral part of the controller.
11. The controllers shall have the hardware to connect, to interrupt, to transfer power, and to protect the motor against overloads.
12. Provide means for the elevator system to restart and resume proper operation automatically in the event of a power failure.
13. The controllers shall be designed to accept as a minimum the re-programming of the following:
  1. Door Close Times
  2. Door Open Times
  3. Door Dwell Times
  4. Acceleration
  5. Deceleration
  6. Jerk Rates
  7. Floor Parking and Options
  8. Recall Levels
14. The controllers shall be provided with on-board diagnostics and status LEDS to aid in troubleshooting, adjusting and maintenance.
15. Permanent status LEDS shall be provided to indicate the following:
  1. safety circuit
  2. door locks
  3. independent service
  4. normal service
  5. inspection operation
  6. emergency power
  7. out of service
  8. drive failure
16. Provide on-board diagnostics to include an event monitor and fault log.
17. Provide a programmable elevator security system and the required interface to lock floors, hall calls and elevators.
  1. Allow for the security system to track users
  2. Provide all additional boards, relays, contacts and interfaces needed for such system
  3. Provide all labour needed to coordinate such system

- 2.4. Grounding
  - 1. Ground the control system and all field apparatus using colour coded bonding wire.
  - 2. The accidental grounding or a short circuit shall not defeat any safety device, and shall not allow the elevator to start or run.
- 2.5. Solid State Starters
  - 1. Provide solid state motor control starter with the following requirement:
    - 1. All digital control using a processor.
    - 2. Adjustable current limit starting Inside the Delta Electronic Motor.
    - 3. Overload Projection.
    - 4. Capable of interfacing with 6 or 12 lead wye delta motors.
    - 5. Detection capability of miswired motors.
    - 6. Onboard 16 character LCD display for parameterization and diagnostic troubleshooting.
    - 7. UL/CSA/CE certification.
    - 8. Minimum capacity of (80) Starts/hour.
- 2.6. MINI PI
  - 1. Assist the Owner in the initial design and general user interface of the panel of the MINI PI manufactured by CE Electronics.
  - 2. Provide training, hardware and software support to install the Mini PI as well as all related support needed to maintain it in the future.
  - 3. Provide and assist the Owner with the programming of the MINI PI including but not limited to providing a USB-KIT for the MINI PI.
  - 4. Ensure proper operation and function of all the position indicators.
  - 5. Provide the Owner with a copy of the software required to program these units as well as a copy of all the related images and graphics at the end of the job.
- 2.7. Victaulic Piping and Coupling
  - 1. Provide the shutoff valve, Victaulic couplings and joints in the machine room and pit.
  - 2. Provide the hydraulic pipes with Schedule 40 piping.
    - 1. Provide grooved piping suitable for hydraulic Victaulic fitting.
    - 2. Provide new pipes from the machine room to the pit.
    - 3. Ensure that all piping is above ground or is protected in PVC piping if buried.
- 2.8. Hydraulic pipeline identification, where required
  - 1. Provide marking to accessible piping located outside the elevator machine room or hoistway labelled "Elevator Hydraulic Line" in letters that are at least 0.75 inches high in a contrasting color.
  - 2. The marking shall be visible after installation and applied at intervals not greater than 9 feet.
  - 3. Provide means to prevent the marking from peeling or fading away.

4. Heat resisting paint stencilled on the piping is the preferred method.
- 2.9. Rupture Valve
1. Provide a rupture valve of the ball-seat valve design.
  2. Provide a rupture valve with a screw-type mounting method.
  3. Provide a rupture valve that prevents uncontrolled movement of the cylinder if a pipe or hose burst occurs.
  4. Provide a rupture valve that interrupts the flow of oil when the pressure difference in the valve exceeds a value that corresponds to the preloading pressure.
  5. Provide a pipe rupture valve which opened automatically when the pressure at the pipe is higher than that at the cylinder.
  6. Provide a valve that seals the opening passage leak-free.
  7. Provide a rupture valve with settable closing flow.
  8. Ensure that the design is of the leak-free closing type.
  9. Ensure that the design allows for proper connection to the cylinder head.
  10. Mount the rupture valve directly to the cylinder and without any isolation, gate valve or noise coupling in between.
  11. Provide a valve with minimal spatial requirement and a compact design.
  12. Attach the rupture valve directly to the cylinders.
3. Hoistway Equipment
- 3.1. Guide Rails
1. Provide #1 guide rails for the main rails.
  2. Install the guide rails using brackets affixed to the hoistway structure.
  3. The brackets should be spaced as follows:
    1. The main rail bracket spacing should accommodate the existing building floor height.
    2. Provide rail clips for fastening the rails to the brackets.
    3. The rail clips should prevent the horizontal movement of the rails.
    4. The rail clips should allow the vertical movements of the rail as the building settles.
- 3.2. Pit Equipment
1. Provide car buffers as required by code.
  2. Provide all required slowdown and limit switches.
  3. Provide all pit steel required to support the buffers.
- 3.3. Hall Door Entrances
1. Provide hall door entrances, headers, and sills for the width and height specified.
  2. Align and fasten the entrances, headers, and sills to the building structure.
  3. Provide fascia plates between the landings, on the top-landing header and on the bottom-landing sill.

4. Provide elevator identification on the entrances as required by code. The identification shall be a minimum of 75mm in height.
  5. Provide, on each hall entrance jamb, raised tactile metallic markings to designate the floor at the height required by code.
  6. Provide fire retainers on hall doors that can withstand 200lbs of impact on the door.
  7. Provide hall door entrances and jambs in specified finishes as noted in Schedule F.
- 3.4. Hall Doors and Hardware
1. Provide doors that matches the cab doors with respect to type and style.
  2. Provide each hall door with pick-up rollers for the car door clutches.
  3. Provide the hall door related equipment required for the installation and proper operation of the hall doors.
  4. Provide code approved hall door locks and interlocks.
  5. Provide eccentric rollers and hangers that are suitable for the door height and weight.
  6. Ensure that each door panel is properly labeled for hoistway fire rating.
  7. Provide durable heavy-duty doors with integral hangers and sound proofing where stainless-steel cladding is required.
  8. Ensure that the equipment and installation of the entrances and doors conforms to all code requirements and fire rating.
  9. Provide floor numbers on the interior walls and/or doors of the hoistway at intervals where a person in a stalled elevator upon opening the car door can determine the floor position.
  10. Provide emergency rescue escutcheon in brass steel finish on each landing to facilitate the rescuing of passengers.
  11. Provide heavy duty Smartork spirators at all landings and ensure that on the lowest landings where air supply can enter the building (main access or egress, parking, path system, etc...) and the top landings where air can escape a second set of door closer is provided (sill closer or gravity closer).
  12. Provide grouting sills at each landing and confirm in writing the floor finishes on each floor so that the sill is flush with the finished floor.
  13. Provide aluminum sills on all landings.
- 3.5. Buffers, Pit Steel and Switches
1. Provide buffers and buffer stand and a new pit steel base.
  2. Fix the pit steel firmly to the pit floor.
  3. Stroke:
    1. The stroke of the buffer spring, as marked on its marking plate
  4. Load Rating
    1. Ensure that the buffers for cars and counterweights are capable of supporting, without being compressed solid or to a fixed stop, a static load having a minimum of 2 times the total weight of:
      - (a) the car and its rated load for car buffers

- (b) the counterweight for counterweight buffers
    - 2. Buffers for cars and counterweights shall be compressed solid or to a fixed stop with a static load of three times the weight of:
      - (a) the car and its rated load for car buffers
      - (b) the counterweight for counterweight buffers
  - 5. Marking Plates
    - 1. Provide each spring buffer with a marking plate showing its load rating and stroke and the number of springs.
    - 2. Where the springs are removable, each spring shall be identified, and the assembly marking plate shall indicate this identification.
    - 3. Markings shall be made in a permanent and legible manner.
  - 6. Paint all the pit steel located underneath the car and counterweight buffer.
  - 7. Ensure that the pit steel is painted with black rust inhibiting painted.
- 3.6. Car Sling and Platform
- 1. Provide a cantilevered car slings of sufficient strength for the speed and capacity as specified.
  - 2. Provide car platforms of sufficient size and strength to accommodate the capacity as specified.
  - 3. Provide fabricated platform frame of formed or structural steel shapes, gusseted and rigidly welded with a wood sub floor. Underside of the platform shall be fireproofed.
  - 4. Mount the platform on isolation pads to prevent any vibration or noise being transmitted from the car sling to the platform.
  - 5. Statically balance the cars, at the halfway point in the hoistway, with the top roller guides removed so that the cars hang in the center between the rails.
  - 6. Provide dynamic balancing assembly with weights arranged on adjustable guides to appropriately balance each cab.
- 3.7. Car Roller Guides
- 1. Provide roller guide assemblies on the top and bottom of the elevators.
  - 2. Provide roller guide assemblies with adjustable float and spring tension.
  - 3. Provide roller guide assemblies with rollers being a minimum of 6" in diameter.
  - 4. Provide neoprene roller wheels.
  - 5. Provide rollers with adjustable stops and solid spacers to eliminate "knee action".
  - 6. Include a cover plate assembly over the rollers.
  - 7. Provide fully adjustable guides for all rails up to 3/4" width standard; which cannot be used on 8lb. rail.
- 3.8. Hall Stations
- 1. Provide a single riser hall stations. The hall stations are to conform to existing codes. The design of the hall stations to be approved by the Architect. The material of the hall stations to be brushed brass steel.

2. Ensure that the center of the button is located at 42" from the landing floor and that the fixture does not protrude more than ½".
  3. Provide hall stations in #4 finish stainless steel.
  4. Provide stainless steel hall stations with DUPAR/MAD Optic Series button with white LED illumination.
  5. Provide in each hall station two buttons (up and down) on the intermediate floors and one button on the terminal floor.
  6. Provide hall fixture at the lobby level to incorporate the special emergency service required under the code.
  7. Owner/Architect to approve the design and material of the hall stations.
- 3.9. Hall Position Indicators
1. Provide seven segment white LED digital position indicators at the lobby level (front and rear). Install the position indicators above the door entrance using stainless steel fixtures in brushed finish.
  2. Provide fixtures, which conform to barrier free access.
  3. Integrate a hall lantern and chime into the position indicator where possible, otherwise mount separately above door.
  4. Provide a car directional indicator in the position indicator which displays the direction of the elevator at all times and in the absence of one, the last known direction.
  5. Provide position indicators with characters at least 2.5" in height to be clearly visible from the landing.
  6. Ensure that the position indicator is visible in normal daylight and working properly.
- 3.10. Lobby Fixtures
1. Provide at the lobby level the following:
    1. A stainless steel panel in brushed finish.
    2. Where available, emergency power switch and LEDs.
    3. Emergency recall switch and LEDs.
    4. Emergency fire recall key in enclosed glass case.
    5. The lobby emergency panels to conform to all current codes.
    6. The final design and location of the lobby panels to be approved by the Owner.
- 3.11. New Jack (Cylinder and Plunger)
1. Installation
    1. Install the holeless jack unit.
      - (a) Set the jack unit assembly so that it is plumb and true.
      - (b) Set jack unit cylinder assembly plumb, centered accurately and shimmed to proper elevation, using centering lugs to prevent dislocation during filling.
  2. Jack specification
    1. Provide cylinder and plunger.

2. The cylinder shall be constructed of steel pipe of sufficient thickness and suitable for the operating pressure.
3. The top of the cylinder shall be equipped with a cylinder head with a drip ring to collect any oil seepage as well as an internal guide ring and self-adjusting packing.
4. Provide a low pressure return line to the tank to minimize the use of oil collection devices in the pit.
5. The plunger shall be constructed of seamless selected steel tubing or pipe of proper diameter machined true and smooth with a fine polished finish.
6. The plunger shall be provided with a stop ring electrically welded to it to prevent the plunger from leaving the cylinder.
7. Means shall be provided to bleed air from the jack unit.
8. Ensure that the plunger is free from knocking noise, vibrations or binding.
9. The plunger head shall be isolated from the platen to prevent electrolytic corrosion.
10. Where more oil is needed or bigger Victaulic pipe is required, include in your cost the replacement of such components.
11. The cylinder should be designed to minimize deflection and to operate without the use of followers.
3. Two Stage Hydraulic
  1. Where two stage hydraulic elevator is provided, ensure that the system is synchronized properly and effectively.
  2. Provide mechanical means to keep the jacks synchronized.
4. Roped Hydraulic
  1. Where needed, provide a roped hydraulic system to provide access to high floors.
  2. Where a three stage hydraulic elevator is proposed, provided roped hydraulic instead.
5. Ride quality
  1. The Contractor shall measure the existing ride quality. These measurements will be compared to the ride quality after the work is performed.
  2. In the event that the ride quality deteriorated by more than 1 mgs peak-peak with the 1999 ISO filter applied, the Contractor is required to correct the ride.
6. System pressure
  1. Do not reduce the jack size.
  2. Do not exceed the normal full load Relief and bypass pressures usually associated with this system.
  3. Provide all required engineering submission to the governing authority.
- 3.12. Electrical Ducts, Troughs and Wireways
  1. Provide hoistway trough designed to protect electrical wiring from dust, dirt, oil, and water.
  2. Provide trough designed to carry hoistway wiring, branch circuits, travelling cable wiring and other groups of conductors.

3. Provide troughs that are open on one side so wires and cables can be laid in along an entire hoistway run.
  4. Provide troughs that would require no pulling of wires or cables.
  5. Provide troughs with NEMA 1 rating (dust).
  6. Provide dual dimensions concentric knockouts for 1/2" and 3/4" conduits.
  7. Provide connectors that would allow for sections and fittings to be rigidly joined together.
  8. Provide vertical slots with 1/2" overlap that would allow for settling of the building. Paint the connector in contrasting colour (black or yellow) so that when the overlap is reduced it would become visibly apparent.
  9. Provide troughs furnished in ANSI 49 gray polyester powder finish inside and out over phosphatized surfaces.
  10. Provide a strain bars installed every 100 feet (30.5m) in vertical runs for wire support.
4. Elevator Cab
- 4.1. Elevator Cab
1. Provide car cabs with a height of 2438 mm (96").
  2. Provide car doors for the width and height specified.
  3. Provide that the transom, posts, headers, base and reveals are provided in #4 finish stainless steel.
  4. Provide car doors in brushed stainless steel finish.
  5. Provide all the necessary hardware for mounting the car doors.
  6. Ensure that each car door panel has a clutch/skate.
  7. Provide electrical and mechanical gate switches.
  8. Provide on top of each cab an exhaust fan with a minimum capacity of 450 cfm.
  9. Ensure that the fan is isolated from the cab to prevent any noise or vibration.
  10. Provide where required provisions and assist in the installation of security camera in the elevator cab.
  11. Provide pad hooks in all cars.
  12. Provide one set of protective pads covering all exposed wall surfaces, but leave access to the car buttons.
  13. Review material and design and ensure that it meets Barrier-Free requirements as stated in Appendix E or the CAN/CSA B44-2019; and
  14. Provide cab interior finishes as per Appendix G (Cab Design A, B or C).
- 4.2. Car Direction Indicators and Chimes
1. Provide car travelling lanterns to operate as per specification (sec.5.12).
  2. Install flush mounted lanterns. Do not provide bulky or surface mounted equipment that protrudes more than 1.0" from the face of the wall.
  3. Provide stainless steel finish to match hall buttons fixtures.
  4. Provide electronic chimes and LED/LCD directional displays.

5. Provide white LED colour digital displays.
  6. Provide displays that are visible under all lighting conditions and can be seen within 180 degrees of the hall direction.
  7. Owner to approve the design and material of the travelling directional lanterns.
- 4.3. Car Slings
1. Statically balance the cars, at the halfway point in the hoistway, with the top guides removed so that the cars hang in the center between the rails.
  2. Ensure that the weight of the car accurately reflects the weight on the crosshead data tag.
  3. Ensure that the sling is balanced and properly supported. Where roller guides are being damaged due to excess pressure, the Contractor shall be held liable for the design.
- 4.4. Top of Car Stations
1. Provide, on top of each car, an inspection station consisting of an emergency stop button, up, down and common inspection buttons, on-off inspection switch.
  2. Provide on top of each car a duplex electrical outlet and light with a guard and switch.
- 4.5. Infra-Red Door Detector
1. Provide infra-red door reversal devices.
  2. Provide new three dimensional (3D) infrared door detection system on every car door.
  3. If the door protective device detects a person or object in its path, at any point during the door closing operation, the doors shall re-open.
  4. The infrared shall be equipped with red/green indicators to highlight door movement.
  5. Provide a system with an eighteen foot range.
  6. The detection device and door operation should be adjusted so that the doors re-open without striking any object or person.
  7. Provide a three-dimensional electronic door detectors on all car doors with the following specifications:
    1. The infrared detector should provide complete door protection.
    2. Distance between beams not to exceed 1.50".
    3. Visible light immunity of 100,000 lux.
    4. Interleaved scan.
    5. Minimal number of sensors 80.
    6. Average response time of 90 ms.
    7. Nudging capable feature.
    8. Fault code.
    9. Audible noise emitted when beam interrupted.
    10. Sensitivity adjustment.
  8. Comply with Sections 5.3 and 5.4.

4.6. Hoistway Access

1. Provide hoistway access key switches to access the car top.
2. The access function to conform to all code requirements.
3. Provide one at the top and another at the bottom of the shaft.
4. Provide access keys to be located in the sight guard or door jamb.

4.7. Car Stations

1. Provide new main and auxiliary swing return Car Operating Panels (COP) in not less than 14Ga stainless steel and finishes to match the front of the cab.
2. Main and auxiliary panels to conform to barrier free access and current code requirements. Provide DUPAR US 91CC LED push buttons with car call registration feedback.
3. Panels to conform to barrier free access and current code requirements.
4. Provide concealed fastening locks.
5. Provide heavy duty hinges that can support the weight of the COP.
6. The building name and logo, car number, government number and the capacity to be engraved in the appropriate place on the return panel.
7. Owner to approve the design and material of the car stations.
8. Main and auxiliary Car stations to tentatively include the following features and layout:
  1. Hands-free emergency phone with one way video and messaging.
  2. Display and camera for the video and messaging system. (internet network with four (4) hour battery back up to be provided by the owner)
  3. CEE Electronics EMN57 Digital LCD car position indicator.
  4. Where provided, install the Pattison and /or Captivate Media Screen and provide the required support for the electrical power, connection and access for proper operation.
  5. Car call buttons marked to correspond to floors served. Provide car call registration feedback.
  6. Door open and door close buttons.
  7. Alarm button with amber illumination.
  8. Provide a hands-free telephone system with automatic dialler integrated into the car station to meet barrier-free access as well as these requirements:
    - (a) Provide a push button identified as "Phone" to initiate communication along with a speaker.
    - (b) Identify the button with a raised international symbol for telephones and Braille markings.
    - (c) Provide visual indication which is activated to acknowledge that the communication has been established. Extinguish the visual indication when the connection is terminated.
    - (d) Provide a display and buttons so that authorized/emergency personnel can communicate via messaging and obtain responses from a trapped passenger who cannot communicate verbally or is hearing impaired.
    - (e) Provide a camera to display video positioned to observe passengers at any location on the car floor.

- (f) Provide four (4) hour battery backup for the entire communication system.
  - (g) Arrange that the communication cannot be terminated from within the cab.
  - (h) Provide twin conductor shielded wiring from the cab to the elevator machine room.
  - (i) Terminate the wiring for all elevator in the machine room at a separate terminal block mounted on the side of a controller.
  - (j) Connect and program the phone to the lobby rescue station (auxiliary lobby telephone equipment) to meet the new code requirements.
  - (k) Provide equipment and wiring compatible with the building's telephone system.
  - (l) Use the lobby rescue station to connect to the elevators so that they can share one telephone line and someone calling into an elevator can select which elevator to call.
  - (m) Provide a line seizure device, including installation, to connect elevator phones (i.e. such as office fax line).
9. Provide a fire fighter switch as follows:
- (a) This key will be of a tubular, 7 pin, style 137 construction and shall have a bitting code of 6143521. The key will be coded "FEO-K1".
  - (b) A three-position ("OFF," "HOLD," and "ON," in that order) key-operated switch shall be labeled "FIRE OPERATION"; provided in an operating panel in each car; and shall be readily accessible.
  - (c) The label "FIRE OPERATION" lettering shall be a minimum of 5 mm (0.25 in.) high in red or a color contrasting with a red background. It shall become effective only when Phase I Emergency Recall Operation is in effect and the car has been returned to the recall level. The switch shall be rotated clockwise to go from "OFF" to "HOLD" to "ON." The "FIRE OPERATION" switch, the "CALL CANCEL" button, the "STOP" switch], the door open button(s), the door close button(s), the additional visual signal, and the operating instructions shall be grouped together at the top of a main car operating panel behind a locked cover.
  - (d) The firefighters' operation panel cover shall be openable by the same key that operates the "FIRE OPERATION" switch.
  - (e) Ensure that when the key is in the "FIRE OPERATION" switch, the cover shall not be capable of being closed. When closed, the cover shall be self-locking.
  - (f) Where rear doors are provided, buttons for both the front and rear doors shall be provided in the firefighters' operation panel. The door open and door close buttons for the rear entrance shall be labelled "OPEN REAR" and "CLOSE REAR."
  - (g) All buttons and switches shall be readily accessible, located not more than 1 800 mm (72 in.) above the floor and shall be arranged as required by Code.
  - (h) The front of the cover shall contain the words "FIREFIGHTERS' OPERATION" in red letters at least 10 mm (0.4 in.) high.
10. The following switches shall be enclosed in a service cabinet: light switch, two speed fan switch, floor passing tone disable switch, voice annunciator disable switch, inspection switch, independent service switch, USB for the PI, emergency light test switch, and emergency stop switch. Also include a GFI 110 AC Volts outlet in the service panel.
11. Provide an EPCO TCEL emergency cab light system which uses the cab lighting for emergency lighting.

12. The car number, government number, building name, no smoking sign and the capacity to be engraved in the appropriate place on the return panel.
  13. Provide a service panel for the security card reader in a separate compartment 8" wide by 8" height with keyed access door and a smokey lens 3.25" x 3.25". In addition provide a spare metal cover plate to fill in smokey lens if card readers are not used.
  14. Provide a bi-lingual male/female voice enunciator with preset and programmable floor designation:
    - (a) Provide a CE Electronics micro com style AMCUM-MMB Digitized Voice Annunciator which utilizes actual male and female voices in a system that is capable of up to 5 minutes of speech.
    - (b) Provide a system which complies with ADAAG 4.10.13 handicap code.
    - (c) The sound should be field selectable and the volume adjustable.
    - (d) The Digitized Voice Annunciator should advise at a minimum of the following:
      - (i) Direction.
      - (ii) Stay away from closing door.
      - (iii) Nudging functions.
      - (iv) Special emergency service.
      - (v) Out of service condition.
- 4.8. Traveling Cables
1. Provide elevator traveling cables. Cables to include a minimum of six (6) shielded pairs of 20 AWG and one (1) coaxial cable.
  2. Provide spare wires consisting of at least 10% of the total number of wires with a minimum of ten (10) spare wires. Do not include in your calculation two (2) coaxial cables, four (4) shielded pairs and three (3) 14 gauge wires.
  3. The traveling cables should form a continuous run from the controller to the elevator cab. Do not terminate the traveling cables at a junction box under the car or in the hoistway.
- 4.9. Wiring
1. Provide machine room, hoistway and car wiring as required for the installation and operation of the elevators.
  2. Provide that the installation of all wiring is in accordance with the Canadian Electrical Code.
  3. Provide wiring for security (where applicable), cab phone, and central monitoring from controllers to a hoistway wiring termination point.
- 4.10. Barrier Free Access
1. Provide barrier free access on all cars as defined in Appendix E of the CAN/CSA B44-13.
- 4.11. Floor Passing Tone
1. Provide a floor passing tone in the cab, which chimes as the elevator is passing a floor.
  2. The sound should be field selectable and the volume adjustable.
  3. The floor passing tone should have a disable function in the car station.

- 4.12. Crosshead Data Plate
  1. Provide new crosshead data plate with the proper weight, date, capacity, speed and date of the elevator manufacturing and modernization.
  2. Provide a tag 2.0" by 3.0" 0.12" thick aluminum with square corners, black background and silver copy.
  3. Attach the tag to the crosshead using 3M adhesive backing and ensure that it is mounted on a clean background to resist casual removal.
- 4.13. Door Operators
  1. Provide closed loop, heavy duty, solid-state door operator.
  2. Provide one ½ hp motor and heavy duty sprocket, chain, belt, and sheaves.
  3. Provide closed loop regulated speed performance.
  4. Provide onsite one hand-held keypad programming unit.
  5. Provide and store the adjustments on the handheld unit.
  6. Provide an operator with adjustable door obstruction reversal.
  7. Provide optical cams with LED indicators.
  8. Provide test switches for open, close, nudging and speed zone set up.
  9. Provide universal inputs for open, close, and nudging.
  10. Provide robust drive linkages to the car door.
  11. Provide a door operator with two pedestal bearing on the main drive shaft.
  12. Provide the car door rollers and track.
  13. Adjust the door closing force so that it does not exceed 30 lbs.
  14. Provide a door operator that would automatically calculate the door weight and speed to regulate the kinetic energy. Where infrared detectors are used, the closing door system shall conform to the following requirements:
    1. The kinetic energy computed for the average closing speed as determined in accordance with 2.13.4.2.2 shall not exceed 10 J (7.37 ft-lbf).
    2. The kinetic energy computed for the actual closing speed at any point in the code zone distance defined by 2.13.4.2.2 shall not exceed 23 J (17 ft-lbf).
  15. Provide a door restrictor.
- 4.14. Car Gate Switches
  1. Provide car gate switches (ensure that the switch is located on the slave arm side or non-locking side).
- 4.15. Car Top Solid State Reader Head
  1. Provide new solid state car top reader head.
  2. Provide new rust resistant hoistway tape with magnetic targets.
  3. Provide proper tensioning equipment to maintain the stability and strength of the hoistway tape.
  4. Provide consistent stopping accuracy within 1/8".

5. Permanently secure the magnet to the steel tape.
  6. Provide low friction guides to ride along the steel tape with no more than 1/8" tolerance.
- 4.16. Car Door Clutch
1. Provide a skate or clutch to suite.
- 4.17. Car Top Railing
1. Provide where needed, on top of the car, metal railing to protect the elevator mechanic from falling.
  2. Install the handrails on all cars at the commencement of the contract award.
  3. Provide a substantial metal guard rail on the sides of the car top.
  4. The guard shall consist of a top rail located approximately 42" above the car top and an intermediate rail located approximately 22" above the car top.
  5. A five (5) inch toeguard shall be provided at the base of the guard.
  6. The guard rails must be designed and installed to withstand a load of 550 N (125 lb.) applied perpendicular to the span in a horizontal at any point on the top rail and a vertical downward load of 1.5 kN per meter (100 lb. per foot) along the top rail.
  7. The horizontal and vertical loads need not be considered to act simultaneously.
  8. Submit as part of your submission, the car top railing as part of your government submission.
- 4.18. Car Door Equipment
1. Provide car doors with vandal resistant stainless steel doors.
  2. Provide all car door rollers.
  3. Provided reversable car door track.
  4. Provide worn or damaged astragals on the leading edge of the doors.
  5. Completely provide the car door panels with vandal resistant stainless steel ones.
- 4.19. Car Top Inspection Station
1. Provide on top of the car, an inspection station consisting of:
    1. An emergency stop button (red colour). The stop switch shall be permanently located on the car top and readily accessible to a person, while standing at the hoistway entrance normally used for access to the car top;
    2. Up and down continuous-pressure type inspection buttons (white colour). A separate device of the continuous-pressure type labeled "ENABLE" shall be provided adjacent to the inspection operating devices. The inspection operating devices shall become effective only when the "ENABLE" device is activated. The inspection operating devices, shall be permitted to be of the portable type provided that:
      - (a) the "ENABLE" device, and a stop switch, in addition to the stop switch required with the stationary inspection station are included in the portable unit; and the flexible cord is permanently attached so that the portable unit cannot be detached from the car top.

3. On-off inspection transfer switch (green switch). The transfer switch shall be located on the car top and shall be so designed as to prevent accidental transfer from the "INSPECTION" to "NORMAL" position;
    4. Duplex electrical outlet;
    5. Provide a secondary hand-held fluorescent trouble light; and
      - (a) Provide two 13 watt fluorescent "H" tube;
      - (b) Not less than eight foot CSA listed Cord; and
      - (c) Provide a handy clip for hanging or strong magnetic base for mounting.
    6. Primary car top lighting with a guard activated by an on/off switch.
  - 4.20. Car Restrictor
    1. Provide a mechanical door restrictor that requires no electrical solenoid or components which can stretch or fail.
    2. Provide a collapsible door restrictor or other moving parts to engage and disengage.
    3. Ensure that the car door remains locked when outside the door zone.
  - 4.21. Car Apron
    1. Passenger elevators currently operated in an apartment building, condominium apartment building or educational institution shall include at the entrance side with a smooth apron made of metal not less than 1.5 millimetres thick, or made of material of equivalent strength and stiffness, reinforced and braced to the car platform such that,
      1. it does not extend less than the full width of the widest hoistway door opening;
      2. it has a straight vertical face, extending below the floor surface of the car-platform, of not less than 1,200 millimetres, except that for an existing elevator this may be reduced where the hoistway pit is not deep enough to accommodate a larger vertical face;
      3. its lower portion is bent back at an angle not less than 60 degrees and not more than 75 degrees from the horizontal; and
      4. will be installed in addition to door restrictors.
  5. Elevator Control and Dispatching
    - 5.1. Door Operation
      1. Provide a heavy duty close loop door operator.
      2. The door operator will facilitate smooth operation under varying environmental influences such as, temperature, wind, friction, and component variation. The processor will monitor the door's actual position and velocity compared to its desired position and velocity.
      3. If variations are detected in the profile the command will be automatically corrected. The Closed Loop Door Operator control system shall not require machine room door control equipment.
      4. Door opening shall be automatic as the car arrives at a landing, and close at the expiration of the door open timer. Doors shall remain open for a time period as follows:
        1. A car call time shall predominate when a car call only is being answered.

2. The hall call time shall predominate when a hall call or both a hall call and car call are being answered.
  3. A short door time shall predominate after a door reversal from the door detector or the door open button.
  4. A short door time shall predominate on a hall call or car call after the beam of the door protective device has been broken.
- (a) The values for the door timers shall be independently field adjustable:

Car Groups	Maximum Door Opening	Maximum Door Closing	Maximum Car Call Door Dwell	Maximum Hall Call Door Dwell	Maximum Short Door Dwell Time
All	2.7 sec	3.5 sec.	3.0 sec.	5.0 sec.	3.0 sec.

5.2. Delayed Car Operation

1. If the elevator is delayed at a landing for a predetermined adjustable time while there are calls in the system, the car shall be removed from the group operation.

5.3. Door Failure Protection

1. If the elevator doors are prevented from closing for a predetermined adjustable time, the door protective device shall become inoperative, and audible signal shall sound, and the door shall close at a reduced speed. Normal door operation shall resume at the next stop.
2. Door Protective Device
3. Provide new two dimensional (2D) and three dimensional (3D) combination infrared door detection systems on every car door.
4. The door re-opening device shall:
  5. Detect cylindrical target(s) approaching the entrance opening of the landing-side doors, at any point during the door closing operation, the doors shall re-open;
  6. Detect approaching objects up to a speed of 1 m/s (3 ft/s);
  7. Detect objects moving towards the entrance between 9" (225mm) – 20" (500mm) from the landing side of the door;
  8. Provide sensor technology not affected by reflected ambient light;
  9. Ignore stationary objects within the three dimensional (3D) zone, whilst still detecting movement towards the door; and
  10. Differentiate movement from the side of the three dimensional (3D) zone and movement approaching the doors.
11. The infrared shall be equipped with red/green indicators to highlight door movement.
12. Provide a system with an eighteen foot range.
13. The detection device and door operation should be adjusted so that the doors re-open without striking any object or person.
14. Provide door detection means on all car doors with the following specifications:
15. The infrared detector should provide complete door protection.

16. Distance between beams not to exceed 1.50".
  17. Visible light immunity of 100,000 lux.
  18. Interleaved scan.
  19. Minimal number of sensors 80.
  20. Average response time of 90 ms.
  21. Nudging capable feature.
  22. Fault code.
  23. Audible noise emitted when beam interrupted.
  24. Sensitivity adjustment.
- 5.4. Advance Door Opening
1. Arrange the door circuit so that the doors start to open as the elevator is leveling into the floor, and are halfway open when the car stops level with the landing.
- 5.5. Performance Criteria
1. The control equipment shall be capable of operating within the specified performance criteria.
  2. Flight time shall be measured from the start of the door close cycle until the doors are 2/3 open at the next landing on a one floor run.

Car Groups	Maximum Flight Time	A95 Vertical Horizontal	Maximum Jerk	Maximum Acceleration	Levelling Accuracy	Speed Variation
All	12.0 sec.	6 mg	7.0 ft/sec <sup>3</sup>	3.5 ft/sec <sup>2</sup>	+/- 1/8"	+/- 2%

- 5.6. Noise Levels
1. Door operation noise level shall be taken during the door opening, door closing, and door reversal cycles.
  2. The cab noise level shall be taken during a full run, bottom to top, and return.
  3. The machine room noise level shall be taken with all cars operating.

Car Groups	Door Operation	Cab	Machine Room
All	62dBA	50dBA	80dBA

- 5.7. Independent Service
1. Provide a key switch in the car panel which, when actuated will take the car out of riser call operation and allow operation from the car buttons only. Door operation shall be activated by constant pressure on the door close button.
  2. Independent service operation shall de-activate the hall and in car lanterns.
  3. Independent service operation shall de-activate the door reversal device.

- 5.8. Inspection
  - 1. Provide a key switch in the main car panel which, when actuated will take the elevator out of service. An inspection-operating fixture on top of the elevator will allow the elevator to be controlled on inspection mode as per code.
- 5.9. Riding Lantern Operation
  - 1. Provide electronic hall chimes with LED light fixtures.
  - 2. Riding lanterns shall illuminate and produce an audible signal to indicate the direction of travel.
  - 3. The audible signal shall sound once for up and twice for down.
  - 4. The volume of the audible signal shall be field adjustable.
  - 5. The lantern shall remain illuminated until the door dwell time has expired.
  - 6. The hall lantern shall provide a five (5) second advance signal before the arrival of the elevator.
- 5.10. Levelling
  - 1. The control circuit shall cause the car to stop automatically at floor level regardless of load or direction of travel within 1/8" with respect to the hoistway sill.
  - 2. The control circuit shall correct for over travel, under travel and cable stretch return.
  - 3. Ensure that the elevator levelling will be maintained under all conditions including building settling otherwise include all required maintenance work to sustain it.
- 5.11. Automatic Emergency Recall Operation: initiation
  - 1. When special emergency service has been initiated, return the elevator to a designated floor, open the doors and maintain the doors opened.
  - 2. In the event that special emergency service is initiated by the actuation of a device at the designated floor, return the elevator to an alternative designated floor approved by the enforcing authority.
  - 3. Arrange the operation for this phase of special emergency service as follows:
    - 1. Reverse an elevator traveling away from the designated floor at the next available floor without opening its doors and cause it to proceed to the designated floor without stopping for car or hall calls.
    - 2. Close the doors of an elevator standing at a floor other than the designated floor under all operating modes, except on car-top maintenance, and cause it to proceed to the designated floor without stopping for car or hall calls.
    - 3. Give a visible and audible signal on the car.
    - 4. Render the emergency stop button, door protective device, door open, door close, and car and hall buttons inoperative.
    - 5. Provide a call cancellation button.
    - 6. Park at the designated floor with the doors open.
  - 4. Arrange that special emergency service is initiated by means of the three position special emergency service keyed switch marked "EMERGENCY RECALL" in red lettering, in either of the following ways:

1. Automatically by actuation of smoke detectors or fire alarm connected through the "AUTO" position of the switch.
  2. By turning the switch to the "ON" position.
- 5.12. Automatic Emergency Recall Operation: return to designated floor
1. After the initiation of special emergency services and after the return to lobby procedure described above has been completed, arrange the circuits so that the elevator runs on special emergency service when the key switch in the car is in the "On" position, using the same key as required for the return to lobby procedure above.
  2. Provide the following operation of the car under these conditions:
    1. Restrict the operation of the elevator to the person in the car.
    2. Prevent the elevator from responding to hall calls.
    3. Render inoperative door protective devices.
    4. Cause the car to respond to a registered car call provided that the doors have been closed by constant pressure on the close button if provided, or otherwise by constant pressure on a car call push button.
    5. Cause the doors to immediately re-open if the pressure on the button is released before the doors have fully closed.
    6. Upon completion of door closing, cause the car to run to the car call floor and stop without opening the doors.
    7. Arrange the circuits so that doors can be opened only by constant pressure on the "door open" button.
    8. Cause the doors to immediately re-close if the pressure on the button is released before the doors have fully opened.
    9. Once fully opened, cause the doors to remain open until closing is initiated as described above.
    10. Cause all car calls to be cancelled by momentarily turning off the keyed special emergency switch in the car.
- 5.13. Manual Emergency Recall Operation: Initiation
1. Arrange that special emergency service is initiated by means of the two position special emergency service keyed switch marked "EMERGENCY RECALL" in yellow lettering, in the following way:
    1. By turning the switch to the "ON" position.
- 5.14. Automatic Emergency Recall Operation: termination
1. Terminate special emergency service under the following conditions:
    1. All cars at the designated floor.
    2. All key switches associated with special emergency service in the "Off" position.
    3. Smoke or heat sensing devices associated with special emergency service either in the normal status or the three-position special emergency service keyed switch turned to the off position for cancellation of special emergency service.

4. The special emergency operation shall comply with all current code regulation in force.
- 5.15. Remote Monitoring System
  1. Provide for the controller to support remote elevator monitoring.
- 5.16. Ride Quality Improvement System
  1. Provide the following information before commencement of modernization:
    1. Documentation with current ride quality readings.
    2. Should the ride quality analyzer indicate that rails are out of alignment and that the ride quality is compromised, the contractor shall re-align the rails.

1. General

1.1 General Requirements

1. Conform to section 14 01 20.

1.2 Number of Elevators

1. Provide elevator(s) in accordance with Schedule A.

1.3 Device Type: Traction

1. Provide traction equipment for each site identified and where noted in Schedule B.

1.4 Arrangement

1. Provide elevator(s) arranged to operate in accordance with the Bank requirement noted in Schedule A.

1.5 Designations

1. The elevators are numbered in numerical order as required by the Architect.

1.6 Drive Method

1. Arrange all cars in standard cantilevered traction arrangement.

1.7 Speed

1. The contract speed for all elevators should be 0.5m/s (100 fpm).

1.8 Capacity

1. Provide for capacity of 954kg (2100 lbs) on all cars.

1.9 Openings and Stops

1. The elevators should be arranged to serve the floors outlined in Schedule B.

1.10 Dimensions

1. Provide equipment to suit the hoistway, overhead and pit dimensions as per the following table and related references.

Traction Elevator	Information Location
Hoistway Width per car	Schedule C
Hoistway Depth per car	Schedule C
Pit Depth	Schedule C
Cab height	Schedule C
Elevator Speed	100 fpm
Overhead (top landing to slab)	Schedule C

1.11 Door Type

1. Provide single slide, horizontal sliding car and hoistway doors.

1.12 Door Entrances

1. Provide 915mm (36") wide by 2133.6mm (84") high doors.

1.13 Related Work

1. All work by others shall conform to governing codes. Any other work required to complete the installation or satisfy the regulatory authorities and not specifically listed herein shall be the responsibility of the elevator Supplier. To complete the elevator installation, the following items must be performed or installed by trades other than the elevator Supplier:

1. Provide suitable machine room ventilation to maintain the machine room temperature between 10° Celsius and 30° Celsius.
2. Provide a fused disconnect switch or circuit breaker for each elevator, with feeder branch wiring to each controller. The switches and size of wires to conform to the Canadian Electrical Code. The disconnect switches are to be mounted in a code approved location.
3. Provide 120 volts, AC, 15 amps fused, single-phase power supply with a fused disconnect switch for each elevator, with feeder wiring to each controller for car lights. Location to be in a code approved location.
4. Provide a separate single-phase power supply of the same voltage as each elevator supply, with 15 amps fused disconnect switch.
5. Provide suitable machine room lights, and convenience outlets in the machine room. The light switch is to be mounted in a code approved location.
6. Provide machine room and building smoke detector wiring to the elevator controllers.
7. Provide wiring and contacts to the elevator controllers for the operation of the special emergency service and emergency power as required by code.
8. Only where applicable, the wiring for elevator security including camera, card readers, hands-free phone, lobby control panel and central elevator monitoring will be terminated in the machine room. The wiring from that hoistway location to the termination point is work by others. The termination point will be the lobby panel, security desk, monitoring station or remote hall station.
9. Provide a separate 120 volts, AC, 15 amps fused, single phase power supply to each elevator monitoring and control system.
10. Provide a signal from the emergency power generator to indicate that the power will be switched from emergency generated to utility generated power.
11. Perform any cutting, patching and painting for the installation of the hall buttons, hall lanterns, position indicators and main floor monitor panel.
12. The Supplier to provide the hoistway divider steel beams (where applicable) and the machine room hoist beam.
13. Provide suitable pit lights, and convenience outlets.
14. Provide dedicated ground wiring.
15. Where required, a safe pathway/catwalk needed with handrails as per the MOL requirements for building rooftops with a low parapet of less than 1066.8mm (42").

1.14 Changes in Material and Work

1. Any change or substitution in the approved equipment must have prior written approval from the Owner and Construction Manager.
2. Any changes in the approved work must have prior written approval from the Owner and Construction Manager.

- 1.15 Cutting, Patching and Other work
  1. Any cutting, patching, painting or other restorative work required to accommodate the installation of the new equipment not specifically listed herein as work by others, shall be the responsibility of the Supplier.
  2. Prior to proceeding with any such work the Supplier shall obtain approval from the Owner and Construction Manager.
- 1.16 Remote Conduit and Wiring
  1. Where provided, any remote conduit and wiring required to interconnect the elevator controllers and the lobby panel, elevator remote monitoring or an elevator management control system, or any other equipment provided under these specifications, and not specifically listed herein as being by others, shall be the responsibility of the Supplier.
  2. Portions of this work may be sub-contracted with approval of the Owner and Construction Manager.
  3. The Supplier is responsible for providing all wiring needed for remote wiring to the lobby panel or security desk.
2. Machine Room
  - 2.1 Motors
    1. Provide gearless machine consisting of an AC motor directly connected to a braking device and to a grooved traction sheave.
    2. Provide Machine beams to mount the deflector sheave where required.
    3. Provide CSA/UL certified permanent magnet synchronous active current motor;
    4. Provide a gearless machine to include:
      1. Traction sheave;
      2. Brake; and
      3. Encoder.
    5. Self-cooling motor that require no additional blowers or fans;
    6. NEMA classifications F insulation rating;
    7. Provide a motor with 44 poles, 90% efficiency rating and absolute shaft mounted encoder;
    8. Provide a heavy duty cast cover for the encoder;
    9. Sheave shaft load that can support double the load or better;
    10. Removable sheave that is capable of supporting a minimum of 10-year rope life;
    11. Sheave hardness between 220-260 Brinell hardness.
    12. Compact design for easy access to the machine room;
    13. Cast iron frame with ribbed design for cooling;
    14. Lubrication fittings for long bearing life and maintenance;
    15. Provide a maintainable thermal sensing device;
    16. Provide instant start-up without the need for pre-torque;

17. Provide a motor that consumes no power at rest;
18. Ensure a quiet and smooth operation;
19. Provide 45% counterweight balance; and
20. Provide sheave groove for a 12.7mm (½") rope diameter.

## 2.2 Machine Brake

1. Provide a dual action independent brake solenoid with manual brake release;
  1. Ensure that each brake shoe holds 125% of the elevator capacity;
  2. Ensure that the dual brake meets the intent of the ascending car protection; and
  3. Unintended car movement.

## 2.3 Auxiliary Braking Device

1. Provide auxiliary braking device that is activated on the elevator ropes to prevent unintended car movement or to prevent ascending car overspeed.
2. Provide devices that act independently of the normal stopping or holding braking device.
3. The auxiliary braking devices shall be capable of stopping the elevator in an upward or downward motion at the full rated speed and load.
4. Activate such brake to prevent ascending car overspeed from striking the hoistway overhead structure as a result of a failure in:
  1. The electric driving-machine motor, brake, coupling, shaft, or gearing;
  2. The control system; or
  3. Any other component upon which the speed of the car depends, except the suspension ropes and the drive sheave of the traction machine.
5. Activate such brake to prevent unintended upward car movement away from the landing with the hoistway door not in the locked position and the car door not in the closed position, as a result of failure in:
  1. The electric driving-machine motor, brake, coupling, shaft, or gearing;
  2. The control system; or
  3. Any other component upon which the speed of the car depends, except the suspension ropes and the drive sheave of the traction machine
6. Arrange for the device and components to be readily accessible for maintenance.
7. Restrict the deceleration effected by the auxiliary braking device to between 25% and 100% of gravity.

## 2.4 Governor and Governor Ropes

1. Provide car governor with the appropriate overspeed and slow-down switches.
2. Provide counterweight (CWT) governor with the appropriate overspeed and slow-down switches.
3. Provide governor rope.
4. Provide the required governor mounting channels.

5. Provide self-resetting governor that can be reset remotely.
6. Provide robust pit idler installed with channels to allow for rope stretching. Do not install pivoting arms.
7. Provide self-resetting governor that can be reset remotely.

2.5 Hoist Ropes

1. Provide hoist ropes of sufficient size and number for the speed and capacity as specified.
2. Provide all the required shackles and springs on the car and counterweight.
3. Provide hoist ropes capable of meeting the requirements of large gearless machine sheave hardness between 220-260 Brinell hardness.
4. Provide a minimum rope diameter of ½" with steel reinforced natural fiber core to provide reduced stretching and cross-section deformation.

2.6 Controllers

1. Provide non-proprietary microprocessor controllers designed to give the required operation as herein specified.
2. Mount panels securely on substantial, self-supporting steel frames designed for floor or wall mounting.
3. Provide completely enclosed controllers with covers.
4. Install wiring on the controllers, whether control or field wiring, in a neat workman like manner.
5. Mark relays, contactors, fuses, printed circuit boards and other components clearly and permanently with designations as shown on the schematics.
6. Mount the designations for plug in components on the controller adjacent to the components.
7. Where required, provide an interface for a Central Monitoring System.
8. Provide non-proprietary diagnostics tools.
9. The control system shall provide comprehensive means of accessing the computer memory for elevator diagnostic purposes.
10. The controllers shall have permanent indicators for important elevator statuses as an integral part of the controller.
11. The controllers shall have the hardware to connect, to interrupt, to transfer power, and to protect the motor against overloads.
12. Provide means for the elevator system to restart and resume proper operation automatically in the event of a power failure.
13. The controllers shall be designed to accept as a minimum the re-programming of the following:
  1. Door Close Times.
  2. Door Open Times.
  3. Door Dwell Times.

4. Acceleration.
5. Deceleration.
6. Jerk Rates.
7. Floor Parking and Options.
8. Recall Levels.
14. The controllers shall be provided with on-board diagnostics and status LEDS to aid in troubleshooting, adjusting and maintenance.
15. Permanent status LEDS shall be provided to indicate the following:
  1. Safety Circuit.
  2. Door Locks.
  3. Independent Service.
  4. Normal Service.
  5. Inspection Operation.
  6. Emergency Power.
  7. Out of Service.
  8. Drive Failure.
16. Provide on-board diagnostics to include an event monitor and fault log.
17. Provide a programmable elevator security system and the required interface to lock floors, hall calls and elevators.
  1. Allow for the security system to track users.
  2. Provide all additional boards, relays, contacts and interfaces needed for such system.
  3. Provide all labour needed to coordinate such system.
- 2.7 Emergency Battery Lowering
  1. Provide a new and independent auxiliary power supply.
  2. Provide proper NEMA rated enclosure independent of the controller.
  3. Provide all the wiring and connections to the controller from the power supply.
  4. Fasten the power supply to the new controller cabinet so that it is not easily removed.
  5. Disable the elevator should the auxiliary power supply fail or become disabled.
  6. Provide a device with the following capabilities:
    1. Automatic charger with battery centric circuits that prevents overcharging.
    2. LED status display with load and battery bar graphs.
    3. Automatic voltage regulation.
    4. Intelligent battery management.
    5. Load Meter.

6. Replace Battery Indicator.
  7. Self-testing.
  8. Sine-wave output.
  9. Site wiring fault indicator.
  10. User replaceable batteries.
  11. Wide input voltage range.
  12. Input voltage 120VAC.
  13. Output voltage 120VAC.
  14. LED status light for: "replace battery" and "overload indicators".
  15. Provide sufficient power to operate the elevator from the top landing to the lowest landing with intermediate stops.
  16. Provide sufficient power to the door operator, valve, emergency lighting, cab lighting, alarm buttons, door open button, safety circuits, down direction circuit and any other devices required for the proper operation of the elevator during power failure.
  17. Provide an additional auxiliary reserve power for no less than 10 minutes.
- 2.8 Auxiliary Disconnect Micro Switch
1. Provide auxiliary disconnect micro switch.
  2. The micro switch should enable the auxiliary power to engage if the disconnect arm is in the "on" position but the power is not available.
  3. The auxiliary switch should prevent the emergency power from engaging if the disconnect arm is in "off" position.
- 2.9 Solid State Motor Drives
1. Provide a closed loop solid-state negative feedback variable-voltage/variable-frequency (VVVF) drives to control the speed, acceleration, and deceleration.
  2. Provide a Matching VVVF Drive with the following features:
    1. Pulse Width Modulation: 16,000 sinusoidal, pulse width modulation for comparing a high frequency triangular carrier wave with a three-phase sinusoidal waveform.
    2. PC interface for drive setup;
    3. Battery backup mode which allows the drive to run on low-power emergency source;
    4. Immediate control assertion;
    5. IGBT power circuits: IGBT power devices in each phase to be switched on where the sine and triangle waves intersect;
    6. Extensive over-current, over-voltage, and over-temperature protection;
    7. Hardware current regulation; and
    8. Integrated, temperature-controlled cooling fan.
  3. Provide a regenerative drive with filters to reduce harmonics in the line.

- 2.10 Solid State Position Encoder
  - 1. Provide a new solid state car position encoder. Provide a position transducer device to transmit to the controller the exact car position with an accuracy of  $\pm 1/8"$  at any position in the hoistway.
  - 2. Provide absolute encoder capable of monitoring distance, speed, direction and absolute position of elevator.
  - 3. Provide absolute encoders feature a special pulse disc that consists of a series of tracks. Each track, executed as a binary bit, has its own series of clear and opaque lines that creates an on/off signal.
  - 4. Provide governor based disks or independently mounted device with wheels but do not provide slotted tapes with reader head.
  - 5. Provide consistent stopping accuracy within  $1/8"$ .
- 2.11 Feedback Devices
  - 1. Provide position transducer devices to transmit to the controllers the exact car position with an accuracy of  $\pm 1/8"$  at any position in the hoistway.
  - 2. Provide velocity transducer devices to transmit to the controllers the precise speed of the elevators to be compared to the velocity profiles. This shall control the velocity, acceleration and deceleration.
  - 3. The elevator brakes shall be provided with brake switches to monitor and provide feedback as to the status of the brakes.
- 2.12 Auxiliary Disconnects
  - 1. Provide auxiliary disconnecting means to remove power from the equipment when line of sight to the main disconnecting switches is obstructed.
- 2.13 Grounding
  - 1. Ground the control system and all field apparatus using colour coded bonding wire.
  - 2. The accidental grounding or a short circuit shall not defeat any safety device, and shall not allow the elevator to start or run.
- 3. Hoistway Equipment
  - 3.1 Guide Rails
    - 1. Provide 12# guide rails for the main rails.
    - 2. Provide minimum of 8# guide rails for the counterweight rails.
    - 3. Install the guide rails using brackets affixed to the hoistway structure.
    - 4. The brackets should be spaced as follows:
      - 1. The main rail bracket spacing should accommodate the existing building floor height.
      - 2. Maximum spacing of 4267.2mm (14'-0") for counterweight rails.
      - 3. Provide rail clips for fastening the rails to the brackets.
      - 4. The rail clips should prevent the horizontal movement of the rails.
      - 5. The rail clips should allow the vertical movements of the rail as the building settles.

- 3.2 Counterweights
  - 1. Provide counterweights that have an over balance of 45% of the car weight.
  - 2. Statically balance the counterweights at the halfway point in the hoistway after completing the cab finishes.
  - 3. Provide counterweight buffer extensions.
- 3.3 Counterweight Roller Guides
  - 1. Provide roller guide assemblies on the top and bottom of the counterweight frame.
  - 2. Provide roller guide assemblies with adjustable float and spring tension.
  - 3. Provide roller guide assemblies with rollers being a minimum of 88.9mm (3.5") in diameter.
  - 4. Provide neoprene roller wheels.
  - 5. Provide rollers with adjustable stops and solid spacers to eliminate "knee action".
  - 6. Include a cover plate assembly over the rollers.
  - 7. Provide fully adjustable guides for all rails up to 19.05mm (3/4") width standard; which can be used on 3.6gk (8lbs). rail.
- 3.4 Buffers, Pit Steel and Switches
  - 2. Provide buffers and buffer stand and a new pit steel base.
  - 3. Fix the pit steel firmly to the pit floor.
  - 4. Stroke:
    - 1. The stroke of the buffer spring, as marked on its marking plate
  - 5. Load Rating
    - 1. Ensure that the buffers for cars and counterweights are capable of supporting, without being compressed solid or to a fixed stop, a static load having a minimum of 2 times the total weight of:
      - (a) the car and its rated load for car buffers
      - (b) the counterweight for counterweight buffers
    - 2. Buffers for cars and counterweights shall be compressed solid or to a fixed stop with a static load of three times the weight of:
      - (a) the car and its rated load for car buffers
      - (b) the counterweight for counterweight buffers
  - 6. Marking Plates
    - 1. Provide each spring buffer with a marking plate showing its load rating and stroke and the number of springs.
    - 2. Where the springs are removable, each spring shall be identified, and the assembly marking plate shall indicate this identification.
    - 3. Markings shall be made in a permanent and legible manner.
  - 7. Paint all the pit steel located underneath the car and counterweight buffer.

8. Ensure that the pit steel is painted with black rust inhibiting paint.
- 3.5 Hall Door Entrances
1. Provide hall door entrances, headers, and sills for the width and height specified.
  2. Align and fasten the entrances, headers, and sills to the building structure.
  3. Provide fascia plates between the landings, on the top-landing header and on the bottom-landing sill.
  4. Provide elevator identification on the entrances as required by code. The identification shall be a minimum of 75mm in height.
  5. Provide, on each hall entrance jamb, raised tactile metallic markings to designate the floor at the height required by code.
  6. Provide fire retainers on hall doors that can withstand 90.7gk (200lbs) of impact on the door.
  7. Provide hall door entrances and jambs in specified finishes as noted in Schedule F.
- 3.6 Hall Doors and Hardware
1. Provide doors that matches the cab doors with respect to type and style.
  2. Provide each hall door with pick-up rollers for the car door clutches.
  3. Provide the hall door related equipment required for the installation and proper operation of the hall doors.
  4. Provide code approved hall door locks and interlocks.
  5. Provide eccentric rollers and hangers that are suitable for the door height and weight.
  6. Ensure that each door panel is properly labeled for hoistway fire rating.
  7. Provide durable heavy-duty doors with integral hangers and sound proofing where stainless-steel cladding is required.
  8. Ensure that the equipment and installation of the entrances and doors conforms to all code requirements and fire rating.
  9. Provide floor numbers on the interior walls and/or doors of the hoistway at intervals where a person in a stalled elevator upon opening the car door can determine the floor position.
  10. Provide emergency rescue escutcheon in brass steel finish on each landing to facilitate the rescuing of passengers.
  11. Provide heavy duty Smartork spirators at all landings and ensure that on the lowest landings where air supply can enter the building (main access or egress, parking, path system, etc...) and the top landings where air can escape a second set of door closer is provided (sill closer or gravity closer).
  12. Provide grouting sills at each landing and confirm in writing the floor finishes on each floor so that the sill is flush with the finished floor.
  13. Provide aluminum sills on all landings.
- 3.7 Car Sling and Platform
1. Provide car slings of sufficient strength for the speed and capacity as specified.

2. Provide car platforms of sufficient size and strength to accommodate the capacity as specified.
  3. Provide fabricated platform frame of formed or structural steel shapes, gusseted and rigidly welded with a wood sub floor. Underside of the platform shall be fireproofed.
  4. Mount the platform on isolation pads to prevent any vibration or noise being transmitted from the car sling to the platform.
  5. Statically balance the cars, at the halfway point in the hoistway, with the top roller guides removed so that the cars hang in the center between the rails.
  6. Provide dynamic balancing assembly with weights arranged on adjustable guides to appropriately balance each cab.
- 3.8 Car Roller Guides
1. Provide roller guide assemblies on the top and bottom of the elevators.
  2. Provide roller guide assemblies with adjustable float and spring tension.
  3. Provide ELSCO roller guide assemblies with rollers being a minimum of 76.2mm (3") in diameter.
  4. Provide neoprene roller wheels.
  5. Provide rollers with adjustable stops and solid spacers to eliminate "knee action".
  6. Include a cover plate assembly over the rollers.
  7. Provide fully adjustable guides for all rails up to 19.05mm (3/4") width standard; which cannot be used on 3.6gk (8lbs). rail.
- 3.9 Hall Stations
1. Provide a single riser hall stations. The hall stations are to conform to existing codes. The design of the hall stations to be approved by the Architect. The material of the hall stations to be brushed stainless steel.
  2. Ensure that the center of the button is located at 1066.8mm (42") from the landing floor and that the fixture does not protrude more than 12.7mm (1/2").
  3. Provide hall stations in #4 finish stainless steel.
  4. Provide stainless steel hall stations with DUPAR US91cc Optic Series button with Green for the up and Red for the down LED illumination.
  5. Provide in each hall station two buttons (up and down) on the intermediate floors and one button on the terminal floor.
  6. Provide hall fixture at the lobby level to incorporate the special emergency service required under the code.
  7. Owner/Architect to approve the design and material of the hall stations.
- 3.10 Hall Position indicators
1. Provide seven segment white LED digital position indicators at the lobby level (front and rear). Install the position indicators above the door entrance using stainless steel fixtures in brushed finish.
  2. Provide fixtures, which conform to barrier free access.

3. Integrate a hall lantern and chime into the position indicator where possible, otherwise mount separately above door.
4. Provide a car directional indicator in the position indicator which displays the direction of the elevator at all times and in the absence of one, the last known direction.
5. Provide position indicators with characters at least 63.5mm (2.5") in height to be clearly visible from the landing.
6. Ensure that the position indicator is visible in normal daylight and working properly.

3.11 Lobby Fixtures

1. Provide at the lobby level the following:
  1. A stainless steel panel in brushed finish.
  2. Where available, emergency power switch and LEDs.
  3. Emergency recall switch and LEDs.
  4. Emergency fire recall key in enclosed glass case.
  5. The lobby emergency panels to conform to all current codes.
  6. The final design and location of the lobby panels to be approved by the Owner.

3.12 Electrical Ducts, Troughs and Wireways

1. Provide hoistway trough designed to protect electrical wiring from dust, dirt, oil, and water.
2. Provide trough designed to carry hoistway wiring, branch circuits, travelling cable wiring and other groups of conductors.
3. Provide troughs that are open on one side so wires and cables can be laid in along an entire hoistway run.
4. Provide troughs that would require no pulling of wires or cables.
5. Provide troughs with NEMA 1 rating (dust).
6. Provide dual dimensions concentric knockouts for 12.7mm (½") and ¾" conduits.
7. Provide connectors that would allow for sections and fittings to be rigidly joined together.
8. Provide vertical slots with 12.7mm (½") overlap that would allow for settling of the building. Paint the connector in contrasting colour (black or yellow) so that when the overlap is reduced it would become visibly apparent.
9. Provide troughs furnished in American National Standards Institute (ANSI) 49 gray polyester powder finish inside and out over phosphatized surfaces.
10. Provide a strain bars installed every 100 feet (30.5m) in vertical runs for wire support.

4. Elevator Cab

4.1 Elevator Cab

9. Provide car cabs with a height of 2438 mm (96").
10. Provide car doors for the width and height specified.
11. Provide that the transom, posts, headers, base and reveals are provided in #4 finish stainless steel.

12. Provide car doors in brushed stainless steel finish.
  13. Provide all the necessary hardware for mounting the car doors.
  14. Ensure that each car door panel has a clutch/skate.
  15. Provide electrical and mechanical gate switches.
  16. Provide on top of each cab an exhaust fan with a minimum capacity of 450 cfm.
  17. Ensure that the fan is isolated from the cab to prevent any noise or vibration.
  18. Provide where required provisions and assist in the installation of security camera in the elevator cab.
  19. Provide pad hooks in all cars.
  20. Provide one set of protective pads covering all exposed wall surfaces, but leave access to the car buttons.
  21. Review material and design and ensure that it meets Barrier-Free requirements as stated in Appendix E of the CAN/CSA B44-2019; and
  22. Provide cab interior finishes as per Appendix G (Cab Design A, B or C).
- 4.2 Car Direction Indicators and Chimes
1. Provide car travelling lanterns to operate as per specification (sec.5.14 hall lantern operation).
  2. Install flush mounted lanterns. Do not provide bulky or surface mounted equipment that protrudes more than 25.4mm (1.0") from the face of the wall.
  3. Provide stainless steel finish to match hall buttons fixtures.
  4. Provide electronic chimes and LED/LCD directional displays.
  5. Provide white LED colour digital displays.
  6. Provide displays that are visible under all lighting conditions and can be seen within 180 degrees of the hall direction.
  7. Owner to approve the design and material of the travelling directional lanterns.
- 4.3 Car Slings
1. Statically balance the cars, at the halfway point in the hoistway, with the top guides removed so that the cars hang in the center between the rails.
  2. Ensure that the weight of the car accurately reflects the weight on the crosshead data tag.
  3. Ensure that the sling is balanced and properly supported. Where roller guides are being damaged due to excess pressure, the Supplier shall be held liable for the design.
- 4.4 Top of Car Stations
1. Provide, on top of each car, an inspection station consisting of an emergency stop button, up, down and common inspection buttons, on-off inspection switch.
  2. Provide on top of each car a duplex electrical outlet and light with a guard and switch.
- 4.5 Infra-Red Door Detector
1. Provide infra-red door reversal devices.

2. Provide new three dimensional (3D) infrared door detection system on every car door.
  3. If the door protective device detects a person or object in its path, at any point during the door closing operation, the doors shall re-open.
  4. The infrared shall be equipped with red/green indicators to highlight door movement.
  5. Provide a system with a 5486.4mm (18 foot) range.
  6. The detection device and door operation should be adjusted so that the doors re-open without striking any object or person.
  7. Provide a three-dimensional electronic door detectors on all car doors with the following specifications:
    1. The infrared detector should provide complete door protection.
    2. Distance between beams not to exceed 38.1mm (1.50").
    3. Visible light immunity of 100,000 lux.
    4. Interleaved scan.
    5. Minimal number of sensors 80.
    6. Average response time of 90 ms.
    7. Nudging capable feature.
    8. Fault code.
    9. Audible noise emitted when beam interrupted.
    10. Sensitivity adjustment.
  8. Comply with Sections 5.3 (door nudging operation) and 5.4 (door protective device).
- 4.6 Load Weighing Devices
1. Provide a load-weighing device to measure the load in the car.
  2. Provide means to sense changes in weight with tolerances no less than 22 kg (48.5 pounds).
  3. Provide feedback to the drive to prevent rollback.
  4. Provide load weighing sensors that mount to the elevator cables or below the platform or at the dead-end hitch (preferred).
  5. Provide hidden legend in the car operating panel to indicate if the elevator is overloaded or when maximum load has been reached.
- 4.7 Hoistway Access
1. Provide hoistway access key switches to access the car top.
  2. The access function to conform to all code requirements.
  3. Provide one at the top and another at the bottom of the shaft.
  4. Provide access keys to be located in the sight guard or door jamb.

██████████ Car Stations

1. Provide new main and auxiliary swing return Car Operating Panels (COP) in not less than 14Ga stainless steel and finishes to match the front of the cab.
2. Main and auxiliary panels to conform to barrier free access and current code requirements. Provide DUPAR US 91CC LED push buttons with car call registration feedback.
3. Panels to conform to barrier free access and current code requirements.
4. Provide concealed fastening locks.
5. Provide heavy duty hinges that can support the weight of the COP.
6. The building name and logo, car number, government number and the capacity to be engraved in the appropriate place on the return panel.
7. Owner to approve the design and material of the car stations.
8. Main and auxiliary Car stations to tentatively include the following features and layout:
  1. Hands-free emergency phone with one way video and messaging.
  2. Display and camera for the video and messaging system. (internet network with four (4) hour battery back up to be provided by the owner)
  3. CEE Electronics EMN57 Digital LCD car position indicator.
  4. Where provided, install the Pattison and /or Captivate Media Screen and provide the required support for the electrical power, connection and access for proper operation.
  5. Car call buttons marked to correspond to floors served. Provide car call registration feedback.
  6. Door open and door close buttons.
  7. Alarm button with amber illumination.
  8. Provide a hands-free telephone system with automatic dialler integrated into the car station to meet barrier-free access as well as these requirements:
    - (a) Provide a push button identified as "Phone" to initiate communication along with a speaker.
    - (b) Identify the button with a raised international symbol for telephones and Braille markings.
    - (c) Provide visual indication which is activated to acknowledge that the communication has been established. Extinguish the visual indication when the connection is terminated.
    - (d) Provide a display and buttons so that authorized/emergency personnel can communicate via messaging and obtain responses from a trapped passenger who cannot communicate verbally or is hearing impaired.
    - (e) Provide a camera to display video positioned to observe passengers at any location on the car floor.
    - (f) Provide four (4) hour battery backup for the entire communication system.
    - (g) Arrange that the communication cannot be terminated from within the cab.
    - (h) Provide twin conductor shielded wiring from the cab to the elevator machine room.
    - (i) Terminate the wiring for all elevator in the machine room at a separate terminal block mounted on the side of a controller.

- (j) Connect and program the phone to the lobby rescue station (auxiliary lobby telephone equipment) to meet the new code requirements.
  - (k) Provide equipment and wiring compatible with the building's telephone system.
  - (l) Use the lobby rescue station to connect to the elevators so that they can share one telephone line and someone calling into an elevator can select which elevator to call.
  - (m) Provide a line seizure device, including installation, to connect elevator phones (i.e. such as office fax line).
9. Provide a fire fighter switch as follows:
- (a) This key will be of a tubular, 7 pin, style 137 construction and shall have a bitting code of 6143521. The key will be coded "FEO-K1".
  - (b) A three-position ("OFF," "HOLD," and "ON," in that order) key-operated switch shall be labeled "FIRE OPERATION"; provided in an operating panel in each car; and shall be readily accessible.
  - (c) The label "FIRE OPERATION" lettering shall be a minimum of 5 mm (0.25 in.) high in red or a color contrasting with a red background. It shall become effective only when Phase I Emergency Recall Operation is in effect and the car has been returned to the recall level. The switch shall be rotated clockwise to go from "OFF" to "HOLD" to "ON." The "FIRE OPERATION" switch, the "CALL CANCEL" button, the "STOP" switch], the door open button(s), the door close button(s), the additional visual signal, and the operating instructions shall be grouped together at the top of a main car operating panel behind a locked cover.
  - (d) The firefighters' operation panel cover shall be openable by the same key that operates the "FIRE OPERATION" switch.
  - (e) Ensure that when the key is in the "FIRE OPERATION" switch, the cover shall not be capable of being closed. When closed, the cover shall be self-locking.
  - (f) Where rear doors are provided, buttons for both the front and rear doors shall be provided in the firefighters' operation panel. The door open and door close buttons for the rear entrance shall be labelled "OPEN REAR" and "CLOSE REAR."
  - (g) All buttons and switches shall be readily accessible, located not more than 1 800 mm (72 in.) above the floor and shall be arranged as required by Code.
  - (h) The front of the cover shall contain the words "FIREFIGHTERS' OPERATION" in red letters at least 10 mm (0.4 in.) high.
10. The following switches shall be enclosed in a service cabinet: light switch, two speed fan switch, floor passing tone disable switch, voice annunciator disable switch, inspection switch, independent service switch, USB for the PI, emergency light test switch, and emergency stop switch. Also include a GFI 110 AC Volts outlet in the service panel.
11. Provide an EPCO TCEL emergency cab light system which uses the cab lighting for emergency lighting.
12. The car number, government number, building name, no smoking sign and the capacity to be engraved in the appropriate place on the return panel.
13. Provide a service panel for the security card reader in a separate compartment 8" wide by 8" height with keyed access door and a smokey lens 3.25" x 3.25". In

addition provide a spare metal cover plate to fill in smokey lens if card readers are not used.

14. Provide a bi-lingual male/female voice enunciator with preset and programmable floor designation:
  - (a) Provide a CE Electronics micro com style AMCUM-MMB Digitized Voice Annunciator which utilizes actual male and female voices in a system that is capable of up to 5 minutes of speech.
  - (b) Provide a system which complies with ADAAG 4.10.13 handicap code.
  - (c) The sound should be field selectable and the volume adjustable.
  - (d) The Digitized Voice Annunciator should advise at a minimum of the following:
    - (i) Direction.
    - (ii) Stay away from closing door.
    - (iii) Nudging functions.
    - (iv) Special emergency service.
    - (v) Out of service condition.

#### 4.8 Traveling Cables

1. Provide elevator traveling cables. Cables to include a minimum of six (6) shielded pairs of 20 AWG and one (1) coaxial cable.
2. Provide spare wires consisting of at least 10% of the total number of wires with a minimum of ten (10) spare wires. Do not include in your calculation two (2) coaxial cables, four (4) shielded pairs and three (3) 14 gauge wires.
3. The traveling cables should form a continuous run from the controller to the elevator cab. Do not terminate the traveling cables at a junction box under the car or in the hoistway.

#### 4.9 Wiring

1. Provide machine room, hoistway and car wiring as required for the installation and operation of the elevators.
2. Provide that the installation of all wiring is in accordance with the Canadian Electrical Code.
3. Provide wiring for security (where applicable), cab phone, and central monitoring from controllers to a hoistway wiring termination point.

#### 4.10 Barrier Free Access

1. Provide barrier free access on all cars as defined in Appendix E of the CAN/CSA B44-19.

#### 4.11 Door Operators

1. Provide closed loop, heavy duty, solid-state door operator.
2. Provide one ½ hp motor and heavy duty sprocket, chain, belt, and sheaves.
3. Provide closed loop regulated speed performance.
4. Provide onsite one hand-held keypad programming unit.
5. Provide and store the adjustments on the handheld unit.

6. Provide an operator with adjustable door obstruction reversal.
  7. Provide optical cams with LED indicators.
  8. Provide test switches for open, close, nudging and speed zone set up.
  9. Provide universal inputs for open, close, and nudging.
  10. Provide robust drive linkages to the car door.
  11. Provide a door operator with two pedestal bearing on the main drive shaft.
  12. Replace the car door rollers and track.
  13. Adjust the door closing force so that it does not exceed 13.6gk (30lbs).
  14. Provide a door operator that would automatically calculate the door weight and speed to regulate the kinetic energy. Where infrared detectors are used, the closing door system shall conform to the following requirements:
    1. The kinetic energy computed for the average closing speed as determined in accordance with 2.13.4.2.2 shall not exceed 10 J (7.37 ft-lbf).
    2. The kinetic energy computed for the actual closing speed at any point in the code zone distance defined by 2.13.4.2.2 shall not exceed 23 J (17 ft-lbf).
  15. Provide a door restrictor.
- 4.12 Car Gate Switches
1. Provide car gate switches (ensure that the switch is located on the slave arm side or non-locking side).
- 4.13 Car Door Clutch
1. Provide a skate or clutch to suite.
- 4.14 Car Top Railing
1. Provide where needed, on top of the car, metal railing to protect the elevator mechanic from falling.
  2. Install the handrails on all cars at the commencement of the contract award.
  3. Provide a substantial metal guard rail on the sides of the car top.
  4. The guard shall consist of a top rail located approximately 1066.8mm (42") above the car top and an intermediate rail located approximately 558.8mm (22") above the car top.
  5. A 127mm (5") toeguard shall be provided at the base of the guard.
  6. The guard rails must be designed and installed to withstand a load of 550 N (125 lb.) applied perpendicular to the span in a horizontal at any point on the top rail and a vertical downward load of 1.5 kN per meter (100 lb. per foot) along the top rail.
  7. The horizontal and vertical loads need not be considered to act simultaneously.
  8. Submit as part of your submission, the car top railing as part of your government submission.
- 4.15 Car Restrictor
1. Provide a mechanical door restrictor that requires no electrical solenoid or components which can stretch or fail.

2. Provide a collapsible door restrictor or other moving parts to engage and disengage.
  3. Ensure that the car door remains locked when outside the door zone.
- 4.16 Car Safeties
1. Provide, on the bottom of each car Type A instantaneous guide clamp safeties with the following characteristics:
    1. Designed in compliance with all requirements of CAN/CSA B44 and ASME A17.1 code;
    2. Stopping force automatically exerted equally on both sides of each guide rail and readily adjustable thorough compression spring on each safety block;
    3. Full swivel of rail grips provides full and uniform contact on all rail faces when safety is actuated;
    4. Simple mounting under plank channels spaced for stile members of any size;
    5. All operating linkage is adjustable and located under the car for easy installation, inspection, and maintenance from elevator pit;
    6. Car safety switch operated by linkage under the counterweight and automatically resets;
    7. Arranged for mounting guide shoes of any type;
    8. Dust tight, watertight, and explosion proof switches to withstand rust and water damage.
5. Elevator Control and Dispatching
- 5.1 Door Operation
1. Provide a heavy duty close loop door operator.
  2. The door operator will facilitate smooth operation under varying environmental influences such as, temperature, wind, friction, and component variation. The processor will monitor the door's actual position and velocity compared to its desired position and velocity.
  3. If variations are detected in the profile the command will be automatically corrected. The Closed Loop Door Operator control system shall not require machine room door control equipment.
  4. Door opening shall be automatic as the car arrives at a landing, and close at the expiration of the door open timer. Doors shall remain open for a time period as follows:
    1. A car call time shall predominate when a car call only is being answered.
    2. The hall call time shall predominate when a hall call or both a hall call and car call are being answered.
    3. A short door time shall predominate after a door reversal from the door detector or the door open button.
    4. A short door time shall predominate on a hall call or car call after the beam of the door protective device has been broken.
  5. The values for the door timers shall be independently field adjustable:

Car Groups	Maximum Door Opening Time	Maximum Door Closing Time	Maximum Car Call Door Dwell Time	Maximum Hall Call Door Dwell Time	Maximum Short Door Dwell Time
Car 1	2.8 sec.	4.1 sec.	3.0 sec.	5.0 sec.	3.0 sec.

5.2 Delayed Car Operation

1. If the elevator is delayed at a landing for a predetermined adjustable time while there are calls in the system, the car shall be removed from the group operation.

5.3 Door Nudging Operation

1. If the elevator doors are prevented from closing for a predetermined adjustable time, the door protective device shall become inoperative, and audible signal shall sound, and the door shall close at a reduced speed. Normal door operation shall resume at the next stop.

5.4 Door Failure Protection

1. If the elevator doors are prevented from closing for a predetermined adjustable time, the door protective device shall become inoperative, and audible signal shall sound, and the door shall close at a reduced speed. Normal door operation shall resume at the next stop.
2. Door Protective Device
3. Provide new two dimensional (2D) and three dimensional (3D) combination infrared door detection systems on every car door.
4. The door re-opening device shall:
5. Detect cylindrical target(s) approaching the entrance opening of the landing-side doors, at any point during the door closing operation, the doors shall re-open;
6. Detect approaching objects up to a speed of 1 m/s (3 ft/s);
7. Detect objects moving towards the entrance between 9" (225mm) – 20" (500mm) from the landing side of the door;
8. Provide sensor technology not affected by reflected ambient light;
9. Ignore stationary objects within the three dimensional (3D) zone, whilst still detecting movement towards the door; and
10. Differentiate movement from the side of the three dimensional (3D) zone and movement approaching the doors.
11. The infrared shall be equipped with red/green indicators to highlight door movement.
12. Provide a system with an eighteen foot range.
13. The detection device and door operation should be adjusted so that the doors re-open without striking any object or person.
14. Provide door detection means on all car doors with the following specifications:
15. The infrared detector should provide complete door protection.
16. Distance between beams not to exceed 1.50".
17. Visible light immunity of 100,000 lux.

18. Interleaved scan.
19. Minimal number of sensors 80.
20. Average response time of 90 ms.
21. Nudging capable feature.
22. Fault code.
23. Audible noise emitted when beam interrupted.
24. Sensitivity adjustment.

5.5 Advance Door Opening

1. Arrange the door circuit so that the doors start to open as the elevator is leveling into the floor, and are halfway open when the car stops level with the landing.

5.6 Performance Criteria

1. The control equipment shall be capable of operating within the specified performance criteria.
2. Flight time shall be measured from the start of the door close cycle until the doors are 2/3 open at the next landing on a one floor run.

Car Groups	Maximum Flight Time	A95 Vertical Horizontal	Maximum Jerk	Maximum Acceleration	Levelling Accuracy	Speed Variation
Car 1	14.0 sec.	6 mg	7.0 ft/sec <sup>3</sup>	3.5 ft/sec <sup>2</sup>	+/- 1/8"	+/- 2%

5.7 Noise Levels

1. Door operation noise level shall be taken during the door opening, door closing, and door reversal cycles.
2. The cab noise level shall be taken during a full run, bottom to top, and return.
3. The machine room noise level shall be taken with all cars operating.

Car Groups	Door Operation	Cab	Machine Room
Car 1	62dBA	50dBA	80dBA

5.8 Independent Service

1. Provide a key switch in the car panel which, when actuated will take the car out of riser call operation and allow operation from the car buttons only. Door operation shall be activated by constant pressure on the door close button.
2. Independent service operation shall de-activate the hall and in car lanterns.
3. Independent service operation shall de-activate the door reversal device.

- 5.9 Inspection
  - 1. Provide a key switch in the main car panel which, when actuated will take the elevator out of service. An inspection-operating fixture on top of the elevator will allow the elevator to be controlled on inspection mode as per code.
- 5.10 Anti-Nuisance
  - 1. The anti-nuisance feature provided shall cancel all car calls when the number of car calls exceeds the measured load setting.
- 5.11 Load By-pass
  - 1. The elevator shall by-pass all hall calls in the direction of travel if loaded to a predetermined adjustable capacity. This shall be initially set at 60% of full load.
- 5.12 Load Weighing
  - 1. The load-weighing operation shall prevent the elevator from running if the load capacity is exceeded.
  - 2. The load-weighing signal shall be used to pre-torque the hoist motor prior to picking the brake to prevent rollback due to an unbalanced car.
- 5.13 Hall Lantern Operation
  - 1. Provide electronic hall chimes with LED light fixtures.
  - 2. Hall lanterns shall illuminate and produce an audible signal to indicate the direction of travel.
  - 3. The audible signal shall sound once for up and twice for down.
  - 4. The volume of the audible signal shall be field adjustable.
  - 5. The hall lantern shall remain illuminated until the door dwell time has expired.
  - 6. The lobby lantern shall only be illuminated on the assigned car.
  - 7. The hall lantern shall provide a five (5) second advance signal before the arrival of the elevator.
  - 8. The illumination shall be green for up and red for down and clearly visible in daylight.
- 5.14 Leveling
  - 1. The control circuit shall cause the car to stop automatically at floor level regardless of load or direction of travel within 1/8" with respect to the hoistway sill.
  - 2. The control circuit shall correct for over travel, under travel and cable stretch return.
  - 3. Ensure that the elevator levelling will be maintained under all conditions including building settling otherwise include all required maintenance work to sustain it.
- 5.15 Automatic Emergency Recall Operation: initiation
  - 1. Arrange that special emergency service is initiated by means of the three position special emergency service keyed switch marked "EMERGENCY RECALL" in red lettering, in either of the following ways:
    - 1. Automatically by actuation of smoke detectors or fire alarm connected through the "AUTO" position of the switch.
    - 2. By turning the switch to the "ON" position.

- 5.16 Automatic Emergency Recall Operation: return to designated floor
1. When special emergency service has been initiated, return the elevator to a designated floor, open the doors and maintain the doors opened.
  2. In the event that special emergency service is initiated by the actuation of a device at the designated floor, return the elevator to an alternative designated floor approved by the enforcing authority.
  3. Arrange the operation for this phase of special emergency service as follows:
    1. Reverse an elevator traveling away from the designated floor at the next available floor without opening its doors and cause it to proceed to the designated floor without stopping for car or hall calls.
    2. Close the doors of an elevator standing at a floor other than the designated floor under all operating modes, except on car-top maintenance, and cause it to proceed to the designated floor without stopping for car or hall calls.
    3. Give a visible and audible signal on the car.
    4. Render the emergency stop button, door protective device, door open, door close, and car and hall buttons inoperative.
    5. Provide a call cancellation button.
    6. Park at the designated floor with the doors open.
- 5.17 Automatic Emergency Recall Operation: car operation
1. After the initiation of special emergency services and after the return to lobby procedure described above has been completed, arrange the circuits so that the elevator runs on special emergency service when the key switch in the car is in the "On" position, using the same key as required for the return to lobby procedure above.
  2. Provide the following operation of the car under these conditions:
    1. Restrict the operation of the elevator to the person in the car.
    2. Prevent the elevator from responding to hall calls.
    3. Render inoperative door protective devices.
    4. Cause the car to respond to a registered car call provided that the doors have been closed by constant pressure on the close button if provided, or otherwise by constant pressure on a car call push button.
    5. Cause the doors to immediately re-open if the pressure on the button is released before the doors have fully closed.
    6. Upon completion of door closing, cause the car to run to the car call floor and stop without opening the doors.
    7. Arrange the circuits so that doors can be opened only by constant pressure on the "door open" button.
    8. Cause the doors to immediately re-close if the pressure on the button is released before the doors have fully opened.
    9. Once fully opened, cause the doors to remain open until closing is initiated as described above.

10. Cause all car calls to be cancelled by momentarily turning off the keyed special emergency switch in the car.
- 5.18 Automatic Emergency Recall Operation: termination
1. Terminate special emergency service under the following conditions:
    1. All cars at the designated floor.
    2. All key switches associated with special emergency service in the "Off" position.
    3. Smoke or heat sensing devices associated with special emergency service either in the normal status or the three-position special emergency service keyed switch turned to the off position for cancellation of special emergency service.
    4. The special emergency operation shall comply with all current code regulation in force.
- 5.19 Firefighter's Elevator
1. Provide that Car 1 can be a designated firefighter's elevator. The firefighter's elevator shall conform to all current codes.
- 5.20 Emergency Power - Provision
1. The elevator Supplier shall provide an affidavit confirming the proper operation of the fire recall signals and confirmation of provision for emergency generator operation.
  2. The elevator Supplier shall provide contacts on the controllers to receive signals from the normal and emergency power contacts.
  3. The transfer between the normal and the emergency power shall be automatic.
  4. The Supplier shall provide the means to limit the transformer inrush current when emergency power is activated.
  5. A signal light marked "ELEVATOR EMERGENCY POWER" shall be provided in the lobby at street level to indicate emergency power is in effect.
  6. The emergency power operation shall be as follows:
    1. Upon loss of normal power and receipt of emergency power the elevators shall automatically return, one at a time, to the lobby floor, or other designated floor.
    2. Any car that is unable to move on command within a preset time interval shall be bypassed and another car shall be selected.
    3. After all cars, that were able to respond to the return to lobby command, have returned to the lobby, a car(s) shall be automatically selected to provide normal elevator service.
    4. Failure of the selected car to move shall cause power to be transferred to another car.
    5. Provide an emergency power selection switch marked "ELEVATOR EMERGENCY POWER" in red lettering at the lobby at street level.
    6. The selector switch shall have a position marked "AUTO" to permit automatic power selection, and shall be locked in that position.
    7. The selector switch shall have positions corresponding to the elevator identification for manual selection of emergency power operation.

8. The emergency power operation shall comply with all current code regulation in force.

In addition to the cab interior section provided in the various section, the following design is applicable to the interior finishes. The Owner shall have the option to select any one of three cab options as provided herein:

**CAB DESIGN - A**

**1.1. Cab Renovation - A**

1. Provide new upgraded cabs as per the following:
2. Flooring
  1. Provide porcelain tile flooring with the following provisions:
    - (a) Provide tile with typical width of 300mm and length of 600mm;
    - (b) Provide a compound design flooring Provide a diagonal grid in the centre of the cab;
    - (c) Provide a minimum tile thickness of 12.5mm;
    - (d) Provide tile to match the finishes of the lobby
    - (e) Install tile on thinset mortar bed. Joints to be no more than 3mm wide.
    - (f) Custom grout colour to match lobby tile colour; and
    - (g) Submit samples for Architect and Owner approval.
3. Ceiling
  1. Provide new ceiling with a stainless steel centre surrounded by six inch (350mm) boarder on all sides.
  2. Provide ample lighting by installing six or more LED fixtures centered in the bordering stainless ceiling:
    - (a) Install all required hardware to make the LED perform as required with dimming switch.
    - (b) Provide high output LED lamps.
    - (c) 255 lumens with cool white;
    - (d) Provide lighting with high color rendition.
    - (e) Provide high lumen output of no less than 150 lux at any point in the elevator cab.
4. Rear Walls
  1. Provide three equally sized panels with a j-trim stainless steel panels.

2. Provide a clear mirror in the centre panel and two P-Lam panels both sides of the mirror.
3. Provide stainless steel reveals and kick-plates.
5. Side Walls
  1. Provide two equally sized horizontally mounted P-Lam surrounded by a protruding ¼" stainless steel trim from the handrail to the kick plate separated by brushed #4 stainless steel reveals.
  2. Provide a single piece clear glass mirror mounted above the handrail and claded by a stainless steel J-trim.
6. Handrails
  1. Provide dual 1½" diameter tubular stainless steel handrail located on all three sides of the cab wall meeting the latest barrier free requirement.
  2. Provide cornered or turned in handrails in the corner and front side of the cab.
7. Provide sample material, drawings and colour chips for the Architect and Owner to choose from.
8. The cab design shall consist of a mirror at the back of the cab, laminates at the side of the cab and stainless-steel reveals and drop ceilings.
9. Where conflicts are identified between regulatory compliance and architectural design, identify the conflict and bring to the attention of the Consultant;
10. Provide a light receptacle, low voltage LED lamp in each panel;
11. Provide six stainless panel drop ceiling. Ensure that each light is centered within the ceiling tile panel;
12. Provide hang on panel from your elegant line of cab interiors; and
13. Provide that each panel has stainless steel #4 finish j-trim (bonding).

**1.2. Cab Renovation - B**

1. Provide new upgraded cabs as per the following:
2. Flooring
  1. Provide vinyl tile flooring with the following provisions:
    - (a) Provide tile with typical width of 600mm and length of 600mm;
    - (b) Provide a compound design flooring Provide a diagonal grid in the centre of the cab;
    - (c) Provide marine rated subflooring that resists water and fluids;
    - (d) Submit samples for Architect and Owner approval.
3. Ceiling
  1. Provide new ceiling with a stainless steel panels.
  2. Provide ample lighting by installing six LED fixtures centered on each of the six panels:
    - (a) Provide high output LED lamps.
    - (b) 255 lumens with cool white;
    - (c) Provide lighting with high color rendition.
    - (d) Provide high lumen output of no less than 150 lux at any point in the elevator cab.
4. Rear Walls
  1. Provide three equally sized panels with stainless steel j-trim laminate panels.
  2. Provide stainless steel reveals and kick-plates.
5. Side Walls
  1. Provide two equally sized horizontally mounted P-Lam surrounded with stainless steel j-trim.
  2. Provide stainless steel reveals and kick-plates.

6. Handrails
  1. Provide dual 1½" diameter tubular stainless steel handrail located on all three sides of the cab wall meeting the latest barrier free requirement.
  2. Provide cornered or turned in handrails in the corner and front side of the cab.
7. Provide sample material, drawings and colour chips for the Architect and Owner to choose from.

**1.3. Cab Renovation - C**

1. Provide new upgraded cabs as per the following:
2. Flooring
  1. Provide porcelain tile flooring with the following provisions:
    - (a) Provide tile with typical width of 600mm and length of 600mm;
    - (b) Provide a compound design flooring Provide a diagonal grid in the centre of the cab;
    - (c) Provide marine rated subflooring that resists water and fluids;
    - (d) Submit samples for Architect and Owner approval.
3. Ceiling
  1. Provide new ceiling with a stainless steel panels.
  2. Provide ample lighting by installing six LED fixtures centered on each of the six panels:
    - (a) Provide high output LED lamps.
    - (b) 255 lumens with cool white;
    - (c) Provide lighting with high color rendition.
    - (d) Provide high lumen output of no less than 150 lux at any point in the elevator cab.
4. Rear Walls
  1. Provide three equally sized panels with a j-trim stainless steel panels from handrail to floor.

2. Provide a mirror finish (#8) stainless steel panel with anti-fingerprint coating surrounded by outer panels with a j-trim stainless steel located from handrail to ceiling.
  3. Provide stainless steel reveals and kick-plates.
5. Side Walls
  1. Provide two equally sized j-trim vandal resistant 5WL stainless steel panels.
6. Handrails
  1. Provide dual 1½" diameter tubular stainless steel handrail located on all three sides of the cab wall meeting the latest barrier free requirement.
  2. Provide cornered or turned in handrails in the corner and front side of the cab.
7. Provide sample material, drawings and colour chips for the Architect and Owner to choose from.

# Appendix B2

City of Toronto  
Part 2 - RFQ for Elevators

Technical Specifications and Requirements for  
Delivery

**This Agreement** entered into on the **[Note to Finalization before Execution: Insert Date of Execution]**

between

**CITY OF TORONTO**

**("City")**

and

● **[Note to Finalization before Execution: Insert Legal Name of Supplier]**

**("Supplier")**

**WHEREAS** the City prequalified general contractors to carry out Work for the City's Accessibility Upgrades Program through a separate Request for Supplier Qualification process, and intends to contract with some or all of those prequalified general contractors through a competitive tender process that will lead to accessibility upgrades of approximately 350 City buildings under the Accessibility Upgrades Program, including elevator installation at some locations;

**WHEREAS** the City wishes to pre-select a supplier for the supply, delivery and installation of elevators and necessary equipment for the City's Accessibility Upgrades Program ("Deliverables");

**WHEREAS** the City issued Request for Quotations No. **[Note to Finalization before Execution: insert RFQ No.]** dated **[Note to Finalization before Execution: insert RFQ date]** including Addendum No. **[Note to Finalization before Execution: insert any addenda numbers and their respective issuance dates]** respectively, (collectively the "RFQ") and in response to the RFQ, the Supplier submitted a response dated **[Note to Finalization before Execution: insert RFQ submission date]** ("RFQ Response"); and

**WHEREAS** the Supplier will be required to enter into direct contracts with General Contractors in order to provide Deliverables;

**WHEREAS** the City and Supplier now wish to enter into this Agreement to establish the terms and prices under which the Supplier will provide Deliverables;

**NOW THEREFORE** in consideration of the mutual covenants herein contained, the City and the Contractor agree as follows:

## **1. DEFINITIONS**

The definitions contained in the RFQ are incorporated into and form a part of this Agreement in addition to the following definitions:

**"Accessibility Upgrades Program"** means the City's accessibility upgrades program for approximately 350 City buildings, including the installation of new elevators in some buildings.

**"Contract Documents"** have the meaning in section 3 of the Agreement.

**"Deliverables"** has the meaning set out in the recitals and further defined in the RFQ.

**"Elevator Supply Contract"** means any contract between the Supplier and a General Contractor retained by the City for Work to be provided for the Accessibility Upgrades Program.

**"Equipment"** means the elevators and other necessary equipment to be supplied by the Supplier as part of the Deliverables.

**"General Contract"** means a contract that the Supplier enters into with a General Contractor for the purpose of providing Work/Services with respect to elevators for the Accessibility Upgrades Program.

**"General Contractor"** means a prequalified general contractor retained by the City for the Accessibility Upgrades Program.

**"Warranty Period"** has the meaning set out in Appendix D of the RFQ.

**"Work"** means the work being performed by General Contractors.

## **2. THE DELIVERABLES AND WORK**

- (1) The Supplier will do and fulfill everything indicated in the Contract Documents.
- (2) The Supplier agrees to provide the Deliverables under any Elevator Supply Contract under the terms and prices set out in the RFQ, RFQ Response, and this Agreement.
- (3) The Supplier acknowledges and agrees that the City does not guarantee the value or volumes of work and that this Agreement forms a standing offer to the Supplier that is subject to the City entering into an a General Contract.
- (4) In the event the Supplier enters into an Elevator Supply Contract, the Supplier shall provide warranty for and maintenance services to the elevators provided under said Elevator Supply Contract to the City, pursuant to the RFQ.

## **3. CONTRACT DOCUMENTS**

The Agreement is comprised of the following Contract Documents, which are incorporated by reference. The following is a list, in order of precedence of the Contract Documents. In

the event of any inconsistency between, or an omission or ambiguity with respect to any provisions contained in any of the following Contract Documents, the following documents shall apply and prevail in the following order of priority to the extent of such conflict, inconsistency, mission, ambiguity or incongruity:

- (a) any duly authorized amendments to the Agreement;
- (b) the Agreement;
- (c) addenda to the RFQ in the order of most recent date issued;
- (d) RFQ; and
- (e) RFQ Response.

Should any discrepancies appear or differences of opinion or misunderstanding arise as to the meaning of the Agreement or as to any omissions therefrom or statements therein in any respect, or as to the quality or dimensions or sufficiency of the Equipment, materials, services or work or any part thereof, or as to the due and proper execution of the Contract Documents, the same shall, subject to the terms of the Contract Documents, be determined by the City.

#### **4. RELATIONSHIP OF THE PARTIES**

The Supplier, in providing the Services for the Work to be performed by the General Contractor under the General Contract, shall and is deemed to be an independent contractor to the General Contractor and not the agent or employee of the City and nothing in the RFQ or Contract Documents shall be deemed or construed as creating any such relationship. Neither is there any intention to create a partnership, joint venture or joint enterprise between the Supplier and the City.

#### **5. GENERAL CONTRACTOR'S OBLIGATIONS**

- (1) The Supplier acknowledges that upon award of a General Contract by the City to a General Contractor, the General Contractor shall be responsible for:

- (a) procuring the Deliverables from the Supplier; and
- (b) making all payments for the Deliverables;

all as if the General Contractor had selected the Supplier for the Services.

- (2) The Elevator Supply Contract from the General Contractor shall be in accordance with the scope, terms and conditions of these RFQ Documents.
- (3) The Supplier acknowledges that General Contractors will be required to enter into General Contracts with the City in the form of agreement set out in Appendix I to the RFQ.

#### **6. PAYMENT TO SUPPLIER FOR DELIVERABLES**

- (1) The Supplier acknowledges the General Contractor will be responsible for paying the Supplier for all payments with respect to the supply of the Deliverables, and the General Contractor will be responsible for making all payments to the Supplier for the Deliverables in accordance with the terms of payment, as described herein, from, but

not necessarily limited to, money received by the General Contractor from the City in payment for the supply of the Deliverables under the General Contract.

- (2) The City shall pay the General Contractor for the supply of the Deliverables, subject to the holdback provisions of the *Construction Act, R.S.O. 1990*.
- (3) The selection of the Equipment and the Supplier by the City pursuant to this RFQ, or the approval of payment under the General Contract for the supply thereof, shall in no way constitute a waiver by the City of its rights to return or reject such Equipment and/or claim damages for: (a) non-compliance with the terms of the RFQ Documents, (b) breach of an expressed or implied warranty or guarantee, or (c) the enforcement of any contractual, legal, equitable or other rights which the City may have under the Contract Documents or General Contract.

## **7. REPRESENTATIONS AND WARRANTIES**

- (1) Without limiting or restricting in any way any other responsibilities and obligations of the Supplier under the Contract Documents, the Supplier represents, warrants and guarantees to the City and shall warrant to the General Contractor (and acknowledges that the City and the General Contractor is relying thereon) that any Deliverables resulting from or to be supplied or developed under the Elevator Supply Contract and all Equipment, and the supply thereof:
  - (a) shall be in strict accordance with all applicable Laws and the City's functional and technical requirements set out in the RFQ including, without limiting the generality of the foregoing, the specifications for the said Equipment, and will function or otherwise perform in accordance with such requirements;
  - (b) shall be free from defects in design, engineering, material, manufacture, workmanship or title;
  - (c) shall perform efficiently and without unwanted interruption during the Warranty Period;
  - (d) shall have any breakage, damage, defects or deterioration (other than those due to the negligence of the General Contractor or the City or to normal wear and tear) in the Equipment that occurs or is detected and is reported to the Supplier within the Warranty Period made good promptly by the Supplier at its expense including the expense of all necessary labour, supervision, travelling, replacement parts, transportation and otherwise; and
- (2) All representations, warranties and guarantees provided herein are in addition to any other representations, warranties and guarantees contained in the Supplier's RFQ Response, including manufacturer's warranties, and all such representations, warranties and guarantees shall be completely transferable by the General Contractor to, and completely enforceable by, the City.
- (3) No inspection, examination, test, acceptance or use of all or any part of the Equipment or services furnished hereunder nor the failure to inspect, examine or test the same nor acceptance thereof nor the expression of any approval by the General Contractor, or by the City pursuant to the General Contract or otherwise, shall constitute acceptance of any defect or shall affect the Supplier's obligation under these warranty provisions, or be deemed to relieve Supplier from any of its obligations under the Contract

Documents, including among others the obligation to supply the Equipment and services satisfying the warranties set forth herein. Such warranties shall survive inspection, test, acceptance and use.

- (4) The Supplier agrees that all representations, warranties and guarantees provided in the Agreement and which are to be incorporated into the Elevator Supply Contract, are fully assignable to and enforceable by the City (where not already expressly reserved to the City) at the City's sole option and further agrees that the City's right to a complete assignment of same shall be included in the Elevator Supply Contract, without any additional compensation payable by the City (including indirectly by the General Contractor) or further approval by the Supplier. The Supplier acknowledges that the City is relying on the representations, warranties and guarantees of the Supplier and, but for same, the City would not have selected the Equipment or Supplier. The Supplier's representations, warranties and guarantees herein shall run to the City, its successors, and assigns.

## **8. DEFECTIVE EQUIPMENT, SERVICES**

- (1) In the event of failure of the Equipment or any part or parts or supply thereof, during the Warranty Period, due to defects of design, materials, or workmanship or other breach of a representation or warranty provided herein, the affected Equipment, or part or parts or supply thereof, shall be replaced promptly upon notice by the General Contractor or the City. All replacement parts shall be furnished, delivered, and installed at the expense of the Supplier.
- (2) Upon receipt of any notice of defect from the General Contractor, the Supplier, at its own expense, shall immediately:
- (a) correct; or
  - (b) re-perform; or
  - (c) replace and fit with new parts; or
  - (d) repair and refit,
- or any combination of the foregoing, without cost or charge to the General Contractor or the City,
- (i) any error, defect, deficiency or malfunction in the Equipment, or any parts, materials or workmanship thereof or services related thereto supplied by the Supplier; or
  - (ii) non-conformance of the Equipment or the supply thereof with the warranty provisions set forth herein or other requirements of the Contract Documents,
- upon notification of the Supplier by the General Contractor or the City within Warranty Period.
- (3) Notwithstanding subsection (2) above, should the Equipment fail to meet the representations and warranties set forth herein in any material respect, such failure shall be deemed cause for the rejection and removal of the unit and for its replacement with an acceptable unit, and the City shall be entitled to require the General Contractor to do so at the sole option of the City, which shall be done at the sole expense of the General Contractor, and if appropriate, the Supplier.

- (4) The Supplier's obligation herein shall include, without limitation, all transportation costs for parts and/or Equipment both ways between the Supplier's factory or repair depot and the point of use. In the case of remedial work to be performed by Supplier hereunder, the Supplier shall provide all labour, supervision, equipment, tools and materials necessary to perform the remedial work and shall bear all expenses in connection therewith or incidental thereto. The Supplier shall perform, at its own cost, such tests as may be reasonably required to verify that corrected, repaired or replaced Equipment conforms to the warranties above.
- (5) Subject to subsection (3) above, if the Supplier chooses to effect a repair under subsection (2) it shall immediately fit a replacement part to enable the Equipment to continue in use until the original part has been repaired and refitted.
- (6) The City will provide the General Contractor reasonable access to such Equipment to assist the General Contractor or Supplier in having work carried out on installed Equipment or in removing or replacing installed Equipment or parts thereof.
- (7) Any Equipment or service or part thereof that is corrected, replaced or repaired in accordance with the warranty provisions herein shall carry and be subject to the same warranty terms as set forth herein, except that the Warranty Period shall start from the date on which the correction, re-performance, replacement or repair is completed and the Equipment is properly operational.
- (8) The Supplier acknowledges that the failure of the Equipment, or any part thereof, to operate and perform properly and in accordance with the warranties provided herein could result in disruption of the Project and substantial revenue loss to City. The Supplier agrees to use its best efforts to perform all warranty work hereunder as expeditiously as is reasonably possible and in a manner which minimizes Project disruption and revenue loss. The Supplier recognizes and agrees that City's operational requirements may require immediate repairs or reworking of defective goods, without notice to the Supplier and without affecting the City's warranty rights hereunder. In such event, the Supplier shall reimburse the City and shall be required to reimburse the General Contractor all costs, delays, or other damages which the City has incurred as a result of such failure. In the event of an emergency breakdown, the Supplier shall attend the location of the emergency breakdown within twenty-four (24) hours of the incident being reported, failing which the City shall have the right to undertake repairs as required and charge the Supplier the cost of the repairs. Subject to subsection (7) above, the Supplier's responsibility shall be discharged when the City is satisfied that the necessary correction, replacement or repair has been properly effected, subject to any warranty applicable thereto.
- (9) The Supplier shall be liable for all damage, loss or expense arising from any failure of the Equipment or delay or failure to perform warranty work hereunder or in restoring the Equipment to working order.
- (10) Nothing in this section shall be construed, in any way, to prejudice or limit the City's contractual rights under the Agreement or the General Contract or any equitable or common law rights available to it.

## 9. PERFORMANCE

In addition to any other provision concerning the performance and personnel of the Supplier:

(1) Under the Elevator Supply Contract:

(a) the Supplier shall make available appropriately skilled workers, consultants or subcontractors, as appropriate, and must be able to provide the necessary materials, tools, machinery and supplies to fulfill its obligations to supply the Equipment in accordance with the terms and conditions of the Contract Documents.

(b) Without limiting the foregoing, the Supplier shall be responsible for complying with the *Occupational Health and Safety Act* (OHSA) at all times during the supply of the Deliverables. The City shall in no way be considered the constructor with respect to any part of the supply of Equipment for the purposes of the OHSA.

(c) It shall be the Supplier's responsibility to co-ordinate, control and check the work of and the provision of the goods and services by its own forces and of all its subcontractors and to ascertain that all work is performed in accordance with all requirements of the Contract Documents. Without limiting the generality of any other provision herein, the Supplier shall be liable for all costs or damages arising from acts, errors or omissions, negligence or wilful misconduct of its subcontractors.

(2) The City shall not be construed to have any contractual relationship with any of the Supplier's employees or subcontractors or material suppliers or their employees or supplier.

(3) The City's general conditions for its General Contract are included in Appendix I to the RFQ and will form part of the General Contract. The Supplier agrees to be bound by the terms and conditions contained therein as they affect the supply of the Deliverables to the Work and the Supplier as a subcontractor to the General Contractor.

(4) Any Equipment, services, work, material or incidentals, not explicitly specified in the RFQ Documents but which are necessary to conform to generally accepted industry, safety or product standards, good construction practice, to produce a finished appearance, or required by the Ontario Building Code or other governing codes, or which may be fairly implied as "included", shall be done or supplied by the Supplier as if such Equipment, services, work, material or incidentals had been explicitly specified.

## 10. COMPLIANCE WITH LAWS

(1) The Supplier, at all times, shall comply with and conform to all statutes, laws, by-laws, regulations, requirements, codes, ordinances, notices, rulings, orders, directives, policies and controls of the municipal, provincial and federal governments and any other lawful authority and all court orders, judgments and declarations of a court of competent jurisdiction (collectively referred to as the "Laws"), applicable to the Equipment and the supply thereof, and the responsibilities and obligations of, the Supplier under the Contract Documents. The Supplier shall ensure that all persons performing the supply of the Deliverables to the Work hold all valid and current permits, licences (including municipal), consents and approvals required by Law with respect to such services to be provided and/or Equipment to be supplied by them.

- (2) The Supplier, at all times, shall cooperate with the General Contractor and the City, as Owner, in promptly furnishing any information that may be required by the Ministry of Labour and any other government regulatory authority with jurisdiction over any matter applicable to the supply of the Deliverables.

## **11. W.H.M.I.S.**

The Equipment shall be supplied in compliance with Canada's Workplace Hazardous Materials Information System (W.H.M.I.S.). Without exception, all Equipment and all parts and material comprising same shall be ASBESTOS-free and TAR-free.

## **12. PROHIBITED PRODUCTS**

- (1) The Supplier must provide the General Contractor with a list of designated substances that will be brought to the Work Site prior to commencing the supply of the Deliverables to the Work. The tender for the General Contract will require that the General Contractor maintain at the Project site, copies of all Materials Safety Data Sheets (MSDS) and an inventory of hazardous materials for each substance on the Project.
- (2) Hazardous products and materials containing any Class A1 carcinogen substance, as indicated in their appropriate Material Safety Data Sheets, shall not comprise any part of the Equipment, or the supply thereof, and are prohibited from City property and the Work Site.
- (3) The Supplier agrees to fully indemnify and save harmless the City, its employees and consultants and the General Contractor from any and all charges, fines, penalties and costs that may be incurred or paid by the City or the General Contractor, as the case may be, or any of their respective employees or if the City or the General Contractor or any of their respective employees shall be made a party to any charge under the *Occupational Health and Safety Act* in relation to any violation of such Act arising out of the supply of the Deliverables.

## **13. OWNERSHIP OF PROJECT DOCUMENTATION**

All information, data, plans, specifications, reports, estimates, summaries, photographs and all other documentation prepared by the Supplier specifically in the connection with the supply of the Deliverables, whether they are in draft or final format, shall be the property of the General Contractor, upon delivery of such documents to the General Contractor, which shall be completely and absolutely transferable to the City under the General Contract.

## **14. PATENT AND COPYRIGHTS**

- (1) Where the supply and incorporation of the Equipment, or any component thereof, to the Work and use of such Equipment, or any component thereof, requires the installation or use of any patented, trademarked, copyrighted or other protected intellectual property ("Intellectual Property"),
  - (a) belonging to the Supplier, the Supplier shall grant to the General Contractor an irrevocable and perpetual license to permit the General Contractor to use such Intellectual Property for the supply, installation and use of the Equipment and all components thereof, as contemplated in the Contract Documents, which licence

shall be completely assignable to the City upon acceptance of the Equipment by the City;

- (b) belonging to any other person, the Supplier shall acquire from and pay for the an irrevocable and perpetual license from the owner thereof entitling the General Contractor to use such third party Intellectual Property for the supply, installation and use of the Equipment and all components thereof, as contemplated in the Contract Documents, which licence shall further be completely assignable to the City, upon acceptance of the Equipment by the City.
- (2) The Equipment price shall include all payments made or to be made or required to be made for the use of any and all Intellectual Property, as provided in subsection (1) above.
- (3) The Supplier, at its sole expense, shall defend, indemnify and save harmless the City, and its employees, officers, consultants and agents, from all and every claim, action or proceeding for damages, costs (including legal fees on a substantial indemnity basis), charges, expenses, royalties, or fees for the alleged infringement or infringement of any patent, trademark, trade secret, copyright or other proprietary right occasioned by them in connection with the supply of the Deliverables by the Supplier or the installation or use of the Equipment by the General Contractor or the City, as contemplated in this Agreement, as well as for any alleged unfair competition resulting from similarity in design, trademark or appearance of goods or services furnished hereunder. The City may, at its option, be represented at any such proceeding.
- (4) If the Equipment or the supply of the Deliverables or the installation or use of the Equipment is held in any such claim, action or proceeding to constitute an infringement, the Supplier, at its expense and in compliance with the Specifications, shall forthwith either procure for the General Contractor or the City, as the case may be, the right to use and continue to use such material or Equipment; or replace same with substantially equal but non-infringing material and Equipment; or modify same to make them substantially equal but non-infringing; or remove same and refund the purchase price and transportation and installation costs and all other costs of the General Contractor or the City related to the removal and loss of use.

## **15. CONFIDENTIALITY**

All correspondence, documentation and information of any kind provided by City, or by any other person on the City's behalf including its consultant, contract administrator or General Contractor, to or which comes to the attention of the Supplier in connection with, or arising out of, or by reason of the RFQ or the supply of the Deliverables remains the property of the City; must be treated as confidential; and must not be used for any purpose other than as contemplated herein and shall not be reproduced, disclosed or disseminated, except as required by Law or as expressly permitted in advance by the City in writing. The RFQ is subject to the *Municipal Freedom of Information and Protection of Privacy Act*, R.S.O. 1990, c. M.56, as amended.

## **16. SPARE PARTS**

The Supplier shall maintain a complete inventory of spare parts commonly needed for the Equipment specified at a location within the Province of Ontario or, alternately, spare parts

must be made available to the General Contractor within 48-hours of any spare part order by the General Contractor during the Warranty Period and, after the Warranty Period, to the City, as soon as reasonably possible but no later than within 30 days. The Supplier represents and warrants that such spare parts inventory shall be maintained for the Equipment for a period of no less than ten (10) years or the life cycle for the Equipment quoted by the Supplier in its RFQ Response, whichever is greater.

## **17. LATE DELIVERY/LIQUIDATED DAMAGES**

- (1) The City accepts no responsibility for any claim made by the General Contractor against the Supplier on account of actual damages or additional costs incurred, or allegedly incurred, by the General Contractor on account of late delivery by the Supplier of any item of Equipment or the Deliverables. Any dispute between the Supplier and the General Contractor with respect to any such claim shall be settled between the Supplier and the General Contractor.
- (2) Failure to meet the completion schedule will subject the Supplier to damages, including liquidated damages, in accordance with the General Contract. The Liquidated Damages assessed by the City against the General Contractor for failure to complete the project within the Contract Time stipulated in the General Contract shall be determined by the City for each General Contract. The General Contractor shall have the right to assess this amount against the Supplier to the extent the Supplier is the reason for any portion of the delay in completion. This is without prejudice to any other remedy of the City or the General Contractor in contract or otherwise at law.

## **18. TRANSFER OF TITLE**

The title to Equipment, components, and materials to be furnished in accordance with the Contract Documents including replacements or substitutions shall pass to the General Contractor upon its acceptance of the Equipment. The passing of the title to the General Contractor (or the subsequent transfer of the Equipment to the City) shall not relieve Supplier from any other liabilities or obligations under the Elevator Supply Contract or the Agreement, which shall remain in full force and effect.

## **19. STORAGE OF EQUIPMENT**

The Supplier shall coordinate the storage of the Equipment at the Work Site with the General Contractor. The Supplier shall be responsible for providing the General Contractor with full instructions in writing of all precautions to be observed in connection with the storing and protection of the Equipment. A copy of all instructions shall be provided to the Contract Administrator. The General Contractor will be responsible for proper storage of the delivered and accepted Equipment, appurtenances and materials until it is installed and for their protection against weather, deterioration, loss, damage or theft.

## **20. COORDINATION WITH WORK BY OTHERS**

- (1) The Supplier shall cooperate and liaise with the General Contractor to make appropriate working arrangements to ensure the satisfactory execution and timely completion of the supply of the Deliverables and related services.

- (2) The City shall provide the General Contractor reasonable access to the Work site necessary to enable the Supplier to complete the supply and services herein.

## **21. UNPAID ACCOUNTS AND LIENS**

- (1) The Supplier shall be required to covenant to the General Contractor to pay all charges incurred by or on behalf of the Supplier for any services, work or materials which may be supplied, done or performed in respect of the supply of the Deliverables and the Supplier shall be required to forthwith discharge and obtain a release of any liens or encumbrances whatsoever arising therefrom at any time claimed or registered against or in respect of the supply of the Deliverables or any part thereof. In the event that the Supplier shall fail to cause any such liens or encumbrances forthwith to be discharged and released after being notified thereof, then, in addition to any other right or remedy of the General Contractor, the General Contractor may, but shall not be obliged to, discharge same by paying the amount claimed to be due and any other amounts necessary to obtain such a discharge and the amount so paid by the General Contractor and all costs and expenses, including reasonable legal fees on a substantial indemnity basis, incurred by the General Contractor in procuring the discharge and release of such lien or encumbrance, shall be payable by the Supplier forthwith.
- (2) The Supplier shall be required to indemnify the General Contractor from all claims arising out of unpaid accounts relating to the supply of the Deliverables including any claims of the City. The General Contractor shall have the right at any time to require satisfactory evidence that the work in respect of which any payment has been made or is to be made by the General Contractor to the Supplier is free and clear of liens, attachments, claims, and demands, charges or other encumbrances.
- (3) In the event that the Supplier shall fail to cause any liens or encumbrances any time claimed or registered against the lands of the Owner in respect of any improvement which the supply of the Deliverables may constitute under the *Construction Act*, R.S.O.1990 to be discharged and released forthwith after being notified thereof, then, in addition to any other right or remedy the City may have by contract, law, statute or in equity, the City may, but shall not be obliged to, discharge same by paying the amount claimed to be due and any other amounts necessary to obtain such a discharge and the amount so paid by the City and all costs and expenses, including reasonable legal fees on a substantial indemnity basis, incurred by the City in procuring the discharge and release of such lien or encumbrance, shall be payable to the City by the Supplier and the General Contractor forthwith. The City shall have the right at any time to require satisfactory evidence that the work in respect of which any payment has been made or is to be made by the City to the General Contractor is free and clear of liens, attachments, claims, and demands, charges or other encumbrances.

## **22. INDEMNIFICATION**

- (1) In consideration of the Supplier being pre-selected by the City for the supply of the Deliverables to the Work under the General Contract, the Supplier covenants and agrees at all times to defend, fully indemnify and save harmless the General Contractor, the City, their councillors, officers, directors, employees, agents and representatives, successors, and assigns (hereinafter called the "Indemnitees") from and against any and

all claims of any nature whatsoever and howsoever caused to, sustained or suffered by, or imposed upon or made or instituted against any of the Indemnitees or to which any of them may be liable by reason of or arising from or related to:

- (a) any act or omission, neglect, default or wilful misconduct on the part of the Supplier as well as any officer, employee, servant, subcontractor, consultant, invitee, agent or assign of the Supplier relating to the supply of the Deliverables; or
  - (b) attributable to or connected with the performance, non-performance or purported performance of the Supplier's obligations pursuant to the Elevator Supply Contract; or
  - (c) in consequence of or in any way arising out of any defect in the Equipment; or
  - (d) by reason of any default, breach, violation, misrepresentation, non-performance or non-compliance of or with any covenant, term, obligation, warranty (express or implied), condition or provision in or related to the Agreement or the Elevator Supply Contract by the Supplier, or
  - (e) any infringement or alleged infringement or other breach, actual or alleged of any Canadian, American or other patent, industrial design, trade secret, trademark, copyright, service mark, trade name, official mark, moral right or any other intellectual property right of any person conferred by contract, common law, statute or otherwise, for which the Supplier is responsible or which is occasioned by the Supplier in connection with the supply of the Deliverables or material to the Work and related services performed by it under the Agreement or the Elevator Supply Contract, or anyone else for whom at law it is responsible; or
  - (f) breach of any confidentiality obligations under the Elevator Supply Contract, except to the extent that the same are directly caused by the negligence or deliberate wrong-doing of the General Contractor.
- (2) In the event any claim is asserted in respect to which any of the Indemnitees is entitled to indemnification under this section, without prejudice to any other right or remedy it may have, the General Contractor shall be entitled to deduct or withhold a reasonable sum on account of such claim, including legal costs, from monies owed or payable by the General Contractor to the Supplier under the Elevator Supply Contract, pending the final determination or settlement of such Claim.
- (3) Upon assuming the defence of any claim covered under this section the Supplier shall keep the party or parties entitled to indemnification herein reasonably informed of the status of the matter, and the Supplier shall make no admission of liability or fault on any GC Indemnatee's part without prior written consent the party or parties entitled to indemnification herein.
- (4) The rights to indemnity provided for in this section shall be deemed to be in addition to and not in lieu of any insurance to be provided by the Supplier and any rights with respect to insurance in favour of the General Contractor. The rights to indemnity provided herein shall survive the expiration or any termination of the Elevator Supply Contract.
- (5) The Supplier acknowledges and agrees that the City, at its option, shall have the right to an assignment of the General Contractor's rights of indemnification herein related to the supply of the Deliverables and may directly enforce such rights against the Supplier.

**23. INSURANCE**

- (1) The Supplier shall comply with all insurance requirements, and all WSIB prior to the execution of this Agreement. The Supplier shall bear all costs, expenses, losses and damages of its own and those of the General Contractor and the City, which may arise as a result of the Supplier failing to or delaying in promptly complying with this condition.
  
- (2) The Supplier agrees to purchase and maintain in force, at its own expense and for the duration of the Agreement, the following policies of insurance, which policies shall be in a form and with an insurer acceptable to the City. A certificate evidencing these policies signed by the insurer or an authorized agent of the insurer must be delivered to the City prior to the commencement of services:
  - (a) Commercial General Liability provided that the policy:
    - (i) is in the amount of not less than Five Million Dollars (\$5,000,000.00), per occurrence;
    - (ii) adds the City of Toronto as an additional insured;
    - (iii) includes Non-Owned Automobile Liability, Employer's Liability and/or Contingent Employer's Liability, and any other provision relevant to the services;
    - (iv) includes a clause which will provide the City with thirty (30) days' prior written notice of cancellation (15 days if cancellation is due to non-payment of premium).
  - (b) Automobile Liability insurance with a minimum limit of Two Million Dollars (\$2,000,000) for all owned or leased licensed motorized vehicles used in the performance of services.
  
- (3) It is understood and agreed that the coverage and limits of liability noted above are not to be construed as the limit of liability of the vendor in the performance of services. It is also agreed that the above insurance policies may be subject to reasonable deductible amounts, which deductible amounts shall be borne by the vendor. At the expiry of the policies of insurance, original signed Certificates evidencing renewal will be provided to the City without notice or demand.
  
- (4) The Supplier is responsible for any loss or damage whatsoever to any of its materials, goods, equipment or supplies and will maintain appropriate all-risk coverage as any prudent owner of such materials, goods, supplies and equipment. The Supplier shall have no claim against the City or the City's insurers for any damage or loss to its property and shall require its property insurers to waive any right of subrogation against the City.

## **24. CONTRACT CANCELLATION**

- (1) The City may cancel the Agreement between the City and the Supplier for any reason, prior to the execution of the Elevator Supply Contract, without any financial obligation to the Supplier. Should for any reason the City not enter into a General Contract which includes the supply of the Deliverables, then the City will notify the Supplier in writing and the Supplier for this Project will be cancelled without any financial obligation to the Supplier.
- (2) In the event of any cancellation, the Supplier shall immediately stop all work related to the Supply Contract, and shall immediately cause any and all suppliers and subcontractors to do the same.
- (3) In the event of any cancellation the City shall not incur any liability to the Supplier apart from payment to the General Contractor, which the General Contractor shall pay over to the Supplier, of the reasonable costs directly incurred by the Supplier for Equipment, work or services that have been satisfactorily delivered or performed by the Supplier prior to the notice of cancellation. Such reasonable costs incurred shall be supported by audit, if necessary, carried out by auditors acceptable to the City, prior to payment of same. Neither the City nor General Contractor shall be liable to the Supplier for loss of anticipated profit on the cancelled portion or portions of the General Contract or the supply of the Deliverables. Neither the City nor General Contractor shall be liable to the Supplier for consequential, economic or indirect losses or damages arising as a result of such cancellation.
- (4) The Supplier shall not be paid for any Equipment supplied or services or work done after receipt of the notice of cancellation or for any costs incurred by the Supplier or its suppliers or subcontractors which such persons could reasonably have avoided or mitigated. The Supplier shall not unreasonably anticipate the requirements of a Purchase Order for the Equipment.

## **25. CHANGES IN THE WORK**

The City may, without invalidating the Agreement or General Contract, direct the General Contractor to make changes to the work which may include changes to the supply of the Deliverables by the Supplier. When a change causes an increase or decrease in the Work related to the supply of the Deliverables, the Deliverables price shall be increased or decreased by the application of RFQ Response prices to the quantum of such increase or decrease, or in the absence of applicable RFQ Response prices, by an amount to be agreed upon between the City and the General Contractor and correspondingly between the General Contractor and the Supplier, under their respective contracts. All such changes shall be in writing. The General Contractor shall, without invalidating the Elevator Supply Contract, have the right to make a corresponding change in the Elevator Supply Contract.

## **26. NON-WAIVER**

No condoning, excusing or overlooking by the General Contractor under the Elevator Supply Contract, or the City under this Agreement, of any default, breach or non-observance by the Supplier at any time or times in respect of any provision herein contained shall operate as a waiver of the General Contractor's or the City's right, as the

case may be, hereunder in respect of any continuing or subsequent default, breach or non-observance, or so as to defeat or affect in any way the rights of the General Contractor or City herein in respect of any such continuing or subsequent default or breach. No waiver shall be inferred from or implied by anything done or omitted by the General Contractor or the City, save only by express waiver in writing. The doing of anything by the General Contractor required by the Elevator Supply Contract to be done by the Supplier shall not relieve the Supplier of its continuing obligation to do that thing. No delay or omission by the City in exercising any right or remedy shall operate as a waiver of them or of any other right or remedy, and no single or partial exercise of a right or remedy shall preclude any other or further exercise of them or the exercise of any other right or remedy.

## **27. SUCCESSORS AND ASSIGNS**

- (1) All terms, covenants, conditions and provisions provided herein relating to the Elevator Supply Contract shall be binding upon and shall enure to the benefit of the Supplier and their respective permitted assigns, successors and legal representatives.
- (2) The Supplier shall not assign, subcontract, transfer or encumber in any manner or part of the Elevator Supply Contract or any interest therein without the prior written consent of the General Contractor, which consent shall not be unreasonably withheld. Any attempt to assign, transfer or encumber any of the duties or obligations of Supplier without such consent is void.
- (3) Any delay in the commencement of the supply of the Deliverables or in the performance of any related services or the Supplier's obligations under the Elevator Supply Contract related to or arising from the General Contractor's consideration of the Supplier's request for an assignment, transfer or encumbrance in any manner or part of the Elevator Supply Contract or any interest therein or a subcontractor change and the costs of same shall be solely borne by the Supplier.
- (4) No assignment or subcontracting by the Supplier shall, in any circumstances, relieve the Supplier from any responsibility for the full performance of all of its responsibilities and obligations and undertaking of its liabilities under the Elevator Supply Contract and this Agreement. Notwithstanding the approval of any subcontractors by the General Contractor, the Supplier shall be fully responsible for every subcontractor's performance, activities, work, acts or omissions as if the Supplier were performing the subcontracted portion of the supply of the Deliverables with its own resources.
- (5) The General Contractor(s) shall be responsible to the City for the performance of all of its subcontractors, including the Supplier. The City shall require any and all such subcontractors to sign agreements with the General Contractor that bind the subcontractors to abide by the terms and conditions hereof. Upon the request of the City, the General Contractor shall furnish the City with copies of such agreements.

## **28. NON-EXCLUSIVE REMEDIES**

The rights and remedies of the City provided in the Contract Documents shall not be exclusive and are in addition to any other rights and remedies provided by contract, law or in equity, including the right of specific performance and offset.

**29. FURTHER ASSURANCES**

The Supplier shall draw, execute and deliver at its own expense, all such instruments and documents, and do all such acts and things as the General Contractor or City may from time to time reasonably consider necessary or advisable for the purpose of carrying out the intent and provisions of the Contract Documents.

**30. GOVERNING LAW**

The Contract Documents shall be governed by, subject to and construed in accordance with the laws of the Province of Ontario and the laws of Canada, as applicable to the matters herein. Any action or other legal proceeding arising under or with respect to the Contract Documents (including any motion or other interlocutory proceeding) shall be brought in a Court or a tribunal, whichever may be applicable, sitting in Toronto, Ontario. The Supplier and the City each irrevocably submit to the exclusive jurisdiction of the courts of the Province of Ontario in accordance with the foregoing.

**31. SEVERANCE WHERE PROVISION ILLEGAL, ETC.**

If any provision or provisions of the Contract Documents or parts thereof or the application thereof to any person or circumstances shall be found is/are found to be invalid, unenforceable or void by any court or tribunal of competent jurisdiction, such provision or provisions or parts thereof shall be deemed severable and all other provision or provisions or parts of the Contract Documents shall be deemed to be separate and independent therefrom and continue in full force and effect unless and until similarly found void and/or unenforceable. The remaining terms and provisions of the Contract Documents and its application to any person or circumstances shall not be affected thereby, but this provision shall apply only insofar as the effect of that severance is not to change the fundamental nature of the obligations assumed respectively by each of the parties thereto.

**32. ENTIRE AGREEMENT**

This Agreement embodies and constitutes the sole and entire agreement between the parties hereto. There are no terms, obligations, covenants or conditions between the parties hereto, other than as contained herein. No alteration, amendment or modification hereof shall be valid unless executed by an instrument in writing by the parties. Neither this Agreement, nor any term hereof, can be changed, modified or abandoned, in whole or in part, except by such instrument in writing, and no subsequent oral agreement shall have any validity whatsoever.

**33. COUNTERPART AND ELECTRONIC SIGNATURE**

This Agreement may be executed in counterpart and may be executed by electronic signature that is received by the City in a file format acceptable to the City. Such electronic signature shall be deemed to be an original signature for the purpose of this Agreement with the same legal effect as an original signature.

**[signatures on next page]**

The parties hereto have executed this Agreement by the hands of their duly authorized representatives.

Appendix B – Technical Specifications 08 71 13 Low Energy Auto Operators

~~Appendix C – Fair Wage Policy~~ **NOT INCLUDED**

~~Appendix D – Master Service Agreement between the City and General Contractors~~ **NOT INCLUDED**

1. **Background**

.1 **Accessibility for Ontarians with Disabilities Act and City's Commitment**

The Accessibility for Ontarians with Disabilities Act, 2005 (AODA) is provincial legislation designed to achieve accessibility for Ontarians with disabilities with respect to goods, services, facilities, accommodation, employment, buildings, structures and premises by January 1, 2025.

In August 2009, City Council adopted and endorsed a 'Statement of Commitment to Creating an Accessible City'. In June 2018, City Council adopted the City of Toronto Corporate Accessibility Policy, which states that the City will ensure accessibility at all its facilities and public spaces.

Refer to Appendix A for the City Corporate Accessibility Policy.

.2 **Corporate Real Estate Management Capital Accessibility Upgrades Program**

The Corporate Real Estate Management (CREM) Division is implementing an accessibility upgrades program for over 350 City buildings under its management with the intent to complete most of it by the end of 2024.

These buildings will be upgraded to meet the requirements of the latest version of the Toronto Accessibility Design Guidelines (TADG) wherever feasible.

In order to complete the accessibility upgrades at these buildings, CREM is establishing a roster of general contractors under a separate procurement call. The work assignments will be carried out pursuant to a second stage competition process consisting of a tender for a group of five (5) to twenty (20) construction projects, bundled generally by a geographic area.

Depending on the project, the work will consist of major and / or minor renovations to the exterior and interior spaces of existing buildings. The majority of buildings, spaces and sites are currently occupied and operational with a short list of vacancies.

In some cases where a building is planned for other repair, rehabilitation, or renovation work, all scopes will be combined together with the accessibility upgrades in the same tender package for a general contractor.

**The need for new automatic door openers at these buildings was identified as part of the accessibility upgrades. The City of Toronto estimates between 4,000 – 5,000 low voltage door operators will be required to complete the upgrades.**

The City of Toronto will direct general contractors selected to deliver accessibility upgrades to procure automatic door openers, push buttons and associated services defined in this RFQ from the Successful Supplier at the unit pricing negotiated by the City.

2. **Scope of Work and Associated Deliverables**

Please refer to Appendix B of Part 3 – Technical Specifications and Requirements for Deliverables. The Specifications detail the Scope of Work requirements in detail by type of equipment. The information provided in this section is a summary of requirements only – refer to the Appendices listed for the full requirements of this Request for Quotation.

- .1 The scope of this RFQ is for the provision of unit pricing for the Supply, Delivery and Installation of Automatic Door Openers and Push Buttons for the City of Toronto's Accessibility Upgrades Capital Program to Various Locations, as and when required from the date of award. General contractors selected to deliver accessibility upgrades will procure Automatic Door Openers, Push Buttons and all associated services from the Successful Supplier at the unit pricing negotiated by the City under this RFQ.
- .2 The selected Supplier will be required to execute a Contract with the City for the provision of unit pricing for the Deliverables. Subsequently, the selected Supplier will be required to enter into contracts to supply, deliver and install automatic door openers, push buttons and necessary equipment with general contractors chosen by the City to deliver accessibility upgrades to City buildings. Master Service Agreement between the City and general contractors is included in Appendix D to this Part 3 - Technical Specifications and Requirements for Deliverables. **Suppliers should review the terms and conditions set out in Part 2 (FORM OF AGREEMENT) to understand the Contract being entered into with the City.**

**3. Performance Security – Not Applicable**

**4. Work Hours**

The work on the accessibility upgrades will be executed according to a strategy devised by general contractors to ensure continuity of operation of the existing facilities, and to also minimize disruption to occupants. After hours and weekend work will be required for a majority of the projects to minimize the disruption to the facility and occupants. Detailed specifications and requirements will be provided in each Tender.

**5. Insurance Requirements**

- .1 The Supplier shall comply with all insurance requirements, and all WSIB prior to the execution of the Contract. The Supplier shall bear all costs, expenses, losses and damages of its own and those of the General Contractor and the City, which may arise as a result of the Supplier failing to or delaying in promptly complying with this condition.
- .2 The Supplier agrees to purchase and maintain in force, at its own expense and for the duration of the Contract and as required in any contract with a general contractor, pursuant to this RFQ, the following policies of insurance, which policies shall be in a form and with an insurer acceptable to the City. A certificate evidencing these policies signed by the insurer or an authorized agent of the insurer must be delivered to the City prior to the commencement of services:
  - a) Commercial General Liability provided that the policy:
    - (i) is in the amount of not less than Two Million Dollars (\$2,000,000.00), per occurrence;

- (ii) adds the City of Toronto as an additional insured;
- (iii) includes a clause which will provide the City with thirty (30) days' prior written notice of cancellation (15 days if cancellation is due to non-payment of premium).
- b) Automobile Liability insurance with a minimum limit of Two Million Dollars (\$2,000,000) for all owned or leased licensed motorized vehicles used in the performance of services.

It is understood and agreed that the coverage and limits of liability noted above are not to be construed as the limit of liability of the vendor in the performance of services. It is also agreed that the above insurance policies may be subject to reasonable deductible amounts, which deductible amounts shall be borne by the vendor. At the expiry of the policies of insurance, original signed Certificates evidencing renewal will be provided to the City without notice or demand.

The successful vendor is responsible for any loss or damage whatsoever to any of its materials, goods, equipment or supplies and will maintain appropriate all-risk coverage as any prudent owner of such materials, goods, supplies and equipment. The successful vendor shall have no claim against the City or the City's insurers for any damage or loss to its property and shall require its property insurers to waive any right of subrogation against the City.

## **6. Delivery**

- .1 The Supplier must deliver the specified Deliverables as per their Quotation without substitution or deviation.
- .2 The Supplier shall provide staff who are qualified to undertake the installation services required under the terms of this RFQ. The Supplier's staff must be certified to maintain, repair, install and set-up the types of equipment and associated parts in Part 5 – Pricing Form.
- .3 Late Delivery, partial shipments or shipment of unauthorized Product may result in the Contract being cancelled.
- .4 The Supplier shall restore all property temporarily removed, damaged, or destroyed during the supply, delivery, and installation of Deliverables to the reasonable satisfaction of the City or to its previous state and at no cost to the City. The Supplier, before final payment, shall remove all surplus materials and any debris of every nature resulting from its operation and put the site(s) in a neat, orderly condition; thoroughly clean. If the Supplier fails to clean up at the completion of the supply, delivery, and installation of the Products, then the City may do so and charge the Supplier for the costs thereof, or deduct said costs from any monies still owing to the Supplier through the general contractor.
- .5 The Supplier shall furnish all labour, materials, services, supplies, tools, equipment, apparatus, transportation, facilities and incidentals required and perform all operations necessary to accomplish the complete installation of the Deliverables.

- .6 A hard copy packing slip must accompany the products delivered and include at a minimum, the purchase order number, the requisitioner's name and address, a description of the items delivered complete with serial numbers, part numbers, and quantity shipped.

**7. Substitutions of Deliverables**

- .1 Suppliers must not substitute contract approved product(s), commodity(s) or service(s) without prior written approval from City of Toronto through the approval by the Consultant, on either City of Toronto letter head or City of Toronto originating email. This will be enforced via subsequent tender documents. Any approved substitution must meet or exceed the approved good, approved commodity or approved service to be substituted, at no additional cost to the City of Toronto. Supplier will reimburse all substitution evaluation costs, including labour and testing costs, to City of Toronto PMMD Standards and Specifications Unit.

**8. Warranty**

- .1 Please refer to Part 3 - Technical Specifications and Requirements for Deliverables - Appendix B, Section 1.10

**9. Usage Reports**

- .1 If requested, the Supplier shall demonstrate the ability to provide an electronic Usage Report in MS Excel 2013 or higher version, of invoice details by providing the following report criteria:

Dollar value and usage information by,

- a) Cost Centre
  - b) Location
  - c) Invoice Number
  - d) By quantity
  - e) By automatic door opener type
  - f) By delivery date
  - g) Usage
  - h) Cumulative Total by month or as requested by the City
- .2 The Supplier shall be required to submit to the City of Toronto, "Usage Reports" on a monthly basis, or as requested, within 30 days after the end of each month and 15 days after the Term expiry date based on Part 5 – Pricing Form and the above report criteria. The Supplier shall also provide a cumulative report at the end of the Contract term based on the aforementioned criteria.
  - .3 The City may further request a detailed Usage Report at any time during the Term to verify releases on the Contract. The Supplier will provide the information within five (5) Business Days of request. Usage Reports shall be provided by the Supplier at no cost to the City.
  - .4 **If requested**, a sample Usage Report detailing the criteria noted above should be included by the Supplier. If a sample Usage Report is not included with Bid submission, the Supplier will provide the report within five (5) Business Days of

request at no cost to the City. Failure to provide the sample report within the specified period may result in the Supplier being declared Non-Compliant.

**10. Product and Service Specifications**

- .1 The Supplier shall be able to provide the Deliverables within the Greater Toronto Area (GTA) as defined in Appendix B of Part 3 – Technical Specifications and Requirements for Deliverables.
- .2 The Supplier shall provide emergency repair Services as and when required during
- .3 All work must be performed to the Ministry of Labour requirements and to manufacturer's specification.
- .4 All specifications are minimum requirements that must be met or exceeded. Bids containing one or more items that do not meet or exceed the minimum specifications will be declared Non-Compliant.
- .5 Suppliers must fully complete the Specifications Form in Part 4 – Submission Items by entering “yes”, meaning the Deliverables being quoted meet or exceed the minimum specifications, or “no”.
- .6 Suppliers that do not fully complete the Specification Forms will be declared Non-Compliant.
- .7 **Optional Maintenance Service.** The City may require that the successful bidder performs service once a year on the automatic swing door units for the period of the warranty (2 years) in its entirety (to the total of 2 services over 2 years). Warranty begins once Substantial Completion is provided for the building where the equipment is installed.

Any defective item in relation to the opening that may affect the performance of the auto operator units or its warranty is to be reported immediately to the City of Toronto facilities maintenance department. This may include but is not limited to: Hinges, pivots, seals, thresholds, locks, panic bars, security devices or any site condition not listed here.

A checklist including the following inspection points is to be submitted to City of Toronto facilities maintenance department upon completion of each service:

- TIGHTEN TOP DOOR TRACK, SLIDE BLOCK & PIN
- CU TIGHTEN DOOR ARMS, LUBE ROD ENDS
- TIGHTEN ROD ARM BOLTS
- CHECK OPERATOR MOUNT BOLTS
- OPERATOR LOVE JOY COUPLER (WEAR, TIGHTNESS)
- MOTOR LOVE JOY COUPLER (WEAR, TIGHTNESS)
- EXAMINE LOVE JOY SPIDER
- TEST & ADJUST MOTION DETECTORS
- TIGHTEN MOTOR BOLTS
- EXAMINE MOTOR BRUSHES
- OPERATOR RUBBER GROMMETS

- EXAMINE & ADJUST DOOR LIMITER
- TEST OPERATION (OPENING, CLOSING, BACK & LATCH)
- INSPECT & TEST (ACTIVE & SAFETY CARPETS, SCANS OR PUSH SWITCHES)
- INSPECT & LUBE TOP DOOR PIVOT
- INSPECT & LUBE BOTTOM DOOR PIVOT
- ADJUST DOOR PIVOTS IF NECESSARY
- INSPECT & LUBE HINGES
- INSPECT FINGERGUARD
- INSPECT DOOR WEATHER-STRIPPING (TOP, BOTTOM, & SIDES)
- INSPECT DOOR HANDLES & PUSH BARS
- CHECK DOOR LOCK

(5) **RIGHT TO REJECT DEBTORS AND SET OFF POLICY**

## SECTION 08 71 13 – LOW ENERGY AUTOMATIC DOOR OPERATORS

### PART 1 GENERAL

#### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. This section includes the following types of automatic door operators:
  - 1. Low-energy door operators for swinging doors.
- B. Related Sections:
  - 1. Division 8 Sections for "Aluminum-Framed Entrances and Storefronts" for entrances furnished and installed separately in Division 8 Section.
  - 2. Division 8 Section "Door Hardware" for hardware to the extent not specified in this section.
  - 3. Division 8 Section "Glazing" for materials and installation requirements of glazing for automatic entrances.
  - 4. Division 26 and 28 Sections for electrical connections including conduit and wiring for automatic entrance operators and access-control devices.

#### 1.3 REFERENCES

- A. References: Comply with the version year adopted by the Authority Having Jurisdiction.
  - 1. ANSI A117.1 - Accessible and Usable Buildings and Facilities.
  - 2. OBC – Ontario Building Code.
  - 3. CUL – Approved for use in Canada.
  - 4. NFPA 80 - Fire Doors and Windows.
  - 5. NFPA 101 - Life Safety Code.
- B. American National Standards Institute (ANSI) / Builders Hardware Manufacturers Association (BHMA).
  - 1. ANSI/BHMA A156.19 Standards for Power Assist and Low Energy Power Operated Doors.
- C. Underwriters Laboratories (UL).
  - 1. UL10C – Positive Pressure Fire Tests of Door Assemblies.
  - 2. UL 325 - Standard for Safety for Door, Drapery, Gate, Louver, and Window Operators and Systems.

#### 1.4 DEFINITIONS

- A. Activation device: Device that, when actuated, sends an electrical signal to the door operator to initiate the door operation.
- B. Monitored Safety Devices: A tested system that works in conjunction with the automatic door control that detects the presence of a person or an object within a zone where contact could occur and provides a signal to stop the movement of the door.
- C. AAADM: American Association of Automatic Door Manufacturers.
- D. Operating ambient Temperature Range: minus 30 C to 50 degrees C.
- E. For automatic door terminology, refer to ANSI/BHMA A 156.19 for definitions of terms.

## 1.5 PERFORMANCE REQUIREMENTS

- A. General: Provide automatic doors that have been designed and fabricated to comply with specified performance requirements, as demonstrated by testing manufacturers corresponding systems.
- B. Compliance:
  - 1. OBC Ontario Building Code – Most Current Edition
  - 2. ANSI/BHMA A 156.19 American National Standard for Power Operated Doors Pedestrian Doors.
  - 3. UL 325 Listed
  - 4. NFPA 101 Life Safety Code
  - 5. CUL Approved for use in Canada
  - 6. UL Listed Fire Door Operator with Automatic Closer
- C. Automatic Door equipment accommodates medium to heavy pedestrian traffic.
- D. Opening Force Requirements:
  - 1. Power-Operated swinging doors shall open with a manual force not to exceed 30 lbf (133N) to set the door in motion and 15 lbf to fully open the door with force applied at 1" (25mm) from the latched edge of the door. The required force to prevent a stopped door from opening or closing shall not exceed 15 lbf (67N) measured 1" (25mm) from the latch edge of the door at any point during the opening or closing.
- E. Closing Time:
  - 1. Door operators shall be field adjustable to close 90 degrees to 10 degrees in 3 seconds or longer per ANSI/BHMA A 156.19 standard.
  - 2. Door shall be field adjusted to close from 10 degrees to fully closed position in not less than 1.5 seconds.

## 1.6 SUBMITTALS

- A. Comply with Division 01 – Submittal Procedures.
- B. Product Data: Manufacturer's product data sheets including installation details, material descriptions, dimensions of individual components and profiles fabrication, operational descriptions and finishes.
- C. Shop Drawings: For automatic entrances. Include plans, elevations, sections, details, hardware mounting heights, additional accessories and attachments to other work.
- D. Samples: color samples of exposed finish as required.
- E. Manufacturers Field Reports: Submit manufacturer's field reports from AAADM certified technician of inspection and approval of doors for compliance with ANSI/BHMA A 156.19 after completion of installation.
- F. Operating and Maintenance Manuals: Provide manufacturers operating, owners and maintenance manuals for each item specified as required in Division 01, Closeout Submittals.

## 1.7 QUALITY ASSURANCE

- A. Manufacturer Qualifications: 10 years minimum of documented experience in manufacturing door equipment similar to that indicated within this specification with a proven record of successful service performance.
- B. Installer Qualifications: Installers, trained by the primary product manufacturers, with a minimum 5 years documented experience installing and maintenance of units similar in material, design, and extent to that indicated in this specification and whose work has resulted in construction with a record of successful in-service performance. Manufacturer's authorized representative who is trained and approved for installation and maintenance of units by AAADM required for this Project

- C. Source Limitations for Automatic Operators: Obtain each type of automatic door operator and supplementary components specified in this section from a single source / single manufacturer where possible.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- E. Power-Operated Door Standard: ANSI/BHMA A 156.19 Current year.
- F. Emergency-Exit Door Requirements: Comply with requirements of authorities having jurisdiction for automatic entrances serving as a required means of egress.

## 1.8 PROJECT CONDITIONS

- A. Field Measurements: Verify actual dimensions of openings to receive automatic entrances by field measurements before fabrication.

## 1.9 COORDINATION

- A. Coordinate door operators with doors, frames, and related work to ensure proper size, thickness, hand, function, and finish. Coordinate hardware for automatic entrances with hardware required for rest of project.
- B. Electrical System Roughing-in: Coordinate layout and installation of automatic power door operator with connections to power supplies and access-control system.

## 1.10 WARRANTY

- A. Automatic Door Operators to be free of defects in material and workmanship for a period of 2 years from the date of substantial completion. This includes the installation of said products.
- B. Safety Sensors to be free of defects in material and workmanship for a period of 2 years from the date of substantial completion.
- C. Activation Devices (Push Buttons (all types) / Wave Buttons / Wireless Buttons / Safety Sensors / Motion Sensors) shall be free of defects in material and workmanship for a period of 2 years from the date of substantial completion.
- D. During the warranty period all warranty work shall be performed during evening hours.

## PART 2 - PRODUCTS

### 2.1 MANUFACTURER

- A. Requests for substitution and product approval in compliance with the specification must be submitted in writing and in accordance with the procedures outlined in Division 1. Approval of requests is at the discretion of the architect, owner, and their designated consultants.
- B. Pre- Approved models are listed below: others may acceptable to the owner. To present a substitution proceed with substitution procedures as outlined in division 1. All substitutions must meet all the criteria of this specification to be considered.
- C. PRE-APPROVED MODELS
- D. Auto operators

(1) Dorma light duty interior use - ED100, Dorma heavy duty exterior and high traffic use ED250

(2) Besam light duty interior use - SW100, Besam heavy duty exterior and high traffic use SW200i

(3) Omega light duty interior use – OA-100, Omega heavy duty exterior and high traffic use OA-100HD

E. Activation Devices

(1) Camden

(2) BEA

(3) WIKK

F. Emergency Call Kits

(1) Camden CX-WEC10K2

G. Push to Lock Kits

(1) Camden Aura CX-WC13XSM or CX-WC13XFM

H. Safety Sensors

(1) Optex - OA-EDGE with LED Indicator

## 2.2 AUTOMATIC SWING DOOR OPERATOR

A. An Integrated, self-learning automatic swing door operator with an advanced CPU, a multistage gearbox with real time adaptive software and available user interface.

1. Automatic Door Configuration:

- a. Configuration: Single swing door or pair of doors swinging.
- b. Traffic Pattern: One Way
- c. Mounting: Surface applied

B. Control Features

1. Power-hold Close
2. Built in Lock Delay
3. On-Off-Hold Open switch control to control door function, (Automatic-Hold Open- Exit Only)
4. On-Off Power Switch
5. Fire Alarm Integration
6. Field Adjustable Handing
7. Push and Go
8. Power Assist Opening Activation
9. Intergraded Connections for Monitored Safety Sensors and other accessories.
10. Integrated access control
11. Wind Load and Stack Pressure microprocessor monitored with power boost to ensure secure opening and closing in changing conditions.

C. Door Control Features:

1. Door Weight Max: Light Duty Operators for interior use 220lbs
2. Door Weight Max: Heavy Duty Operators for exterior & high traffic use 600lbs

D. Header Size: **not to exceed** 4 5/16" Height x 6" Depth

## 2.3 ACTIVATION DEVICES

1. Push Plate( Standard Application) : Hard wired, 4 ½" x 4 ½" square or 6" round stainless steel push plate engraved with "Push to Open" with a handicap logo and complete with mounting box ( surface or flush mount – site determined) made by the same manufacturer. Mounting boxes on the exterior shall be complete with weathertight seals.
2. Wireless Push Plate (Site Related Alternate Device) : Radio controlled, 900 MHZ wireless or kinetic, 4 ½" x 4 ½" square or 6" round stainless steel push plate engraved with "Push to Open" with a handicap logo and complete with mounting box ( surface or flush mount – site determined) made by the same manufacturer. Mounting boxes on the exterior shall be complete with weathertight seals.
3. Touchless Wave Plate (Owner Optional Device): 4 ½" x 4 ½" square with LED lit activation sensor. Microwave or infrared technology has an adjustable range of 1"-28" and complete with mounting box ( surface or flush mount – site determined) made by the same manufacturer. Mounting boxes on the exterior shall be complete with weathertight seals.
4. All Openings requiring the use of access control devices (card readers, intercoms) shall be equipped with an advanced logic relay CX-33 from Camden Controls.

## E.

### **OBC UNIVERSAL & BARRIER FREE WASHROOM REQUIRMENTS**

1. All universal and barrier free washrooms are to be equipped with an emergency call kit as outlined in OBC. This kit shall contain the following items:
  - 1) "PRESS FOR ASSISTANCE" Maintained mushroom button & assistance requested LED Annunciator with adjustable sounder
  - 2) Single gang LED Dome light with adjustable sounder
  - 3) White Panel sign 6" x 10 5/8" with red letters on a white background stating "IN THE EVENT OF AN EMERGENCY PUSH EMERGENCY BUTTON AND AUDIBLE AND VISUAL SIGNAL WILL ACTIVATE"
2. All universal and barrier free washrooms are to be equipped with a Push to Lock kit. This kit shall contain the following items:
  - 1) Hard wired, 4 ½" x 4 ½" square stainless-steel push plate engraved with "Push to Open" with a handicap logo and complete with mounting box (surface or flush mount – site determined) made by the same manufacturer.
  - 2) Hard wired, 4 ½" x 4 ½" square stainless steel push plate engraved with "Push to Open" with a handicap logo and complete with AURA LED switchable mounting box ( surface or flush mount – site determined) made by the same manufacturer.
  - 3) Hard wired, 4 ½" x 4 ½" square stainless-steel push plate engraved with "Push to Lock" and complete with AURA LED switchable mounting box (surface or flush mount – site determined) made by the same manufacturer.
  - 4) 1 x Door Contact
  - 5) 1x CX33 Logic Relay

## 2.4 SAFETY DEVICES

- A. Provide door controls in accordance with ANSI/BHMA standards A 156.19 and complying with cited BHMA standard for condition of exposure and for long-term, maintenance-free operation under normal traffic load. When presence sensors are used, they shall be monitored in accordance with ANSI/BHMA A 156.10. Coordinate controls with door operation and door operators.
- B. Door Mounted Presence Sensor:
  1. Adaptive Door Mounted Sensor System (When required – to be determined by the architect:

- a. Adaptive Door Mounted Safety Systems (ADMSS): Door mounted presence sensor, where the sensor shall be mounted on both the swing (pull) side and the approach (push) side of the door. No header mounted sensor is required.
  - 1) The sensor shall provide a full detection pattern that covers the entire swing path of the door and provides detection in the fully open and full close position. While the door is in motion, the pattern shall be capable of providing door panels from 24" to 48"
  - 2) The sensor will provide secondary activation as required for "knowing act" doorways.
  - 3) Sensors to be field installed and adjusted in accordance with applicable safety standards.
- b. System will reactivate a closing door, stop/stall an opening door, keep a closed door closed and keep an open-door open if a person is within the detection zone of the sensors.
- c. System shall be equipped with an external LED display that allows installer to easily determine detection area and make fine adjustments.
- d. Sensor automatically learns distance to floor and automatically adjusts based upon application requirements.
- e. Sensor shall cover entire door width minus 1" and be equipped with the correct quantity of sensors required to properly cover the entire area of detection.

## 2.5 ELECTRICAL

- A. Provide 115-120 volt, 60 cycle, single phase, maximum 15 ampere service for 1-2 operators, 30 ampere service for 3-4 operators, and as follows:
  1. Coordinate with Division 26 for provision of service to each operator from junction box for multiple operators.
  2. Provide electrical conduit and wiring from specified controls to operators as outlined on manufacturer's drawings.

## 2.6 FINISHES

- B. Anodized Finish:
- C. Operators shall be finished in the most appropriate finish listed below to match the opening and the existing building finishes.
  1. Clear Anodized Finish:
  2. Dark Bronze or Black Anodized Finish:

## EXECUTION

### PART 3 - EXECUTION

#### 3.1 EXAMINATION

- A. Examine doors and frames with Installer present, for compliance with requirements for installation tolerances, wall and floor construction and other conditions affecting performance of automatic entrances.
- B. Examine roughing in for electrical source power to verify actual locations of wiring connections.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.2 INSTALLATION

- A. General: Do not install damaged components. Fit frame joints to produce hairline joints free of burrs and distortion. Rigidly secure non-movement joints.

- B. Entrances: Install automatic entrances plumb and true in alignment with established lines and grades without warp or rack of framing members and doors. Anchor securely in place.
  - 1. Install surface-mounted hardware using concealed fasteners to greatest extent possible.
  - 2. Set headers, carrier assemblies, tracks, operating brackets, and guides level and true to location with anchorage for permanent support.
- C. Door Operators: Connect door operators to electrical power distribution system as specified in Division 26 Sections.
- D. Sealants: Comply with requirements specified in Division 07 Section "Joint Sealants" to provide seal between the operator housing and wall surface. Installation.
- E. Signage: Apply signage on both sides of each door and each sidelight as required by ANSI/BHMA A 156.19

### 3.3 FIELD QUALITY CONTROL

- A. Manufacturer's representative shall provide technical assistance and guidance for installation of automatic doors.
  - 1. Factory trained and AAADM certified representative shall test and inspect each automatic door to determine compliance of the installed system to ANSI/BHMA A 156.19

### 3.4 ADJUSTING

- A. Adjust door operators and controls for smooth and safe operation.

### 3.5 CLEANING AND PROTECTION

- A. Clean adjacent surfaces soiled by automatic operator installation promptly after installation .

### 3.6 DEMONSTRATION

- A. Engage a factory authorized representative to train Owner's maintenance personnel to adjust, operate, and maintain safe operation of automatic entrances.

END OF SECTION 087113

## Standard Packages

### Package #1A

Door Description: Single door with card access and latch retraction panic bars (Exterior)

Quantity	Item Description
1	Heavy Duty Model Operator
2	4 ½" x 4 ½" Push Button – C/W Barrier free logo & "Push to Open"
1	4 ½" x 4 ½" Surface Mount Box (Interior)
1	4 ½" x 4 ½" Surface Mount Box Weatherized (Exterior)
1	CX-33 Logic Relay
1	Latch Retraction Panic Bars <b>TO BE PROVIDED BY HARDWARE SUPPLIER</b>

### Package #1B

Door Description: Pair of doors with card access and latch retraction panic bars (Exterior)

Quantity	Item Description
2	Heavy Duty Model Operator
2	4 ½" x 4 ½" Push Button – C/W Barrier free logo & "Push to Open"
1	4 ½" x 4 ½" Surface Mount Box (Interior)
1	4 ½" x 4 ½" Surface Mount Box Weatherized (Exterior)
1	CX-33 Logic Relay
2	Latch Retraction Panic Bars <b>TO BE PROVIDED BY HARDWARE SUPPLIER</b>

### Package #1C

Door Description: Pair of doors with card access and latch retraction panic bars (Exterior)

Quantity	Item Description
1	Heavy Duty Model Operator
2	4 ½" x 4 ½" Push Button – C/W Barrier free logo & "Push to Open"
1	4 ½" x 4 ½" Surface Mount Box (Interior)
1	4 ½" x 4 ½" Surface Mount Box Weatherized (Exterior)
1	CX-33 Logic Relay
1	Latch Retraction Panic Bars <b>TO BE PROVIDED BY HARDWARE SUPPLIER</b>

## Package #2A

Door Description: Single door with Push / Pull Application (Exterior)

Quantity	Item Description
1	Heavy Duty Model Operator
2	4 ½" x 4 ½" Push Button – C/W Barrier free logo & "Push to Open"
1	4 ½" x 4 ½" Surface Mount Box (Interior)
1	4 ½" x 4 ½" Surface Mount Box Weatherized (Exterior)
1	Key Switch to turn off at night CM2210 x 7224
1	Mortise Cylinder for Key Switch

## Package #2B

Door Description: Pair of doors with Push / Pull Application (Exterior)

Quantity	Item Description
2	Heavy Duty Model Operator
2	4 ½" x 4 ½" Push Button – C/W Barrier free logo & "Push to Open"
1	4 ½" x 4 ½" Surface Mount Box (Interior)
1	4 ½" x 4 ½" Surface Mount Box Weatherized (Exterior)
1	Key Switch to turn off at night CM2210 x 7224
1	Mortise Cylinder for Key Switch

## Package #2C

Door Description: Pair of doors with Push / Pull Application (Exterior)

Quantity	Item Description
1	Heavy Duty Model Operator
2	4 ½" x 4 ½" Push Button – C/W Barrier free logo & "Push to Open"
1	4 ½" x 4 ½" Surface Mount Box (Interior)
1	4 ½" x 4 ½" Surface Mount Box Weatherized (Exterior)
1	Key Switch to turn off at night CM2210 x 7224
1	Mortise Cylinder for Key Switch

## Package #3

Door Description: Single door with card access (interior)

Quantity	Item Description
1	Standard Duty Model Operator
2	4 ½" x 4 ½" Push Button – C/W Barrier free logo & "Push to Open"
2	4 ½" x 4 ½" Surface Mount Box (Interior)
1	CX33 Logic Relay
1	Electric Strike <b>TO BE PROVIDED BY HARDWARE SUPPLIER</b>

## Package #3B

Door Description: Pair of doors with card access (interior)

Quantity	Item Description
2	Standard Duty Model Operator
2	4 ½" x 4 ½" Push Button – C/W Barrier free logo & "Push to Open"
2	4 ½" x 4 ½" Surface Mount Box (Interior)
1	CX33 Logic Relay
1	Electric Strike <b>TO BE PROVIDED BY HARDWARE SUPPLIER</b>

## Package #3C

Door Description: Pair of doors with card access and latch retraction panic bars (Interior)

Quantity	Item Description
2	Standard Duty Model Operator
2	4 ½" x 4 ½" Push Button – C/W Barrier free logo & "Push to Open"
2	4 ½" x 4 ½" Surface Mount Box (Interior)
1	CX-33 Logic Relay
2	Latch Retraction Panic Bars <b>TO BE PROVIDED BY HARDWARE SUPPLIER</b>

## Package #3D

Door Description: Pair of doors with card access and latch retraction panic bars (Interior)

Quantity	Item Description
1	Standard Duty Model Operator
2	4 ½" x 4 ½" Push Button – C/W Barrier free logo & "Push to Open"
2	4 ½" x 4 ½" Surface Mount Box (Interior)
1	CX-33 Logic Relay
1	Latch Retraction Panic Bars <b>TO BE PROVIDED BY HARDWARE SUPPLIER</b>

## Package #4

Door Description: Single door push/pull washroom multistall (Interior)

Quantity	Item Description
1	Standard Duty Model Operator
2	4 ½" x 4 ½" Push Button – C/W Barrier free logo & "Push to Open"
2	4 ½" x 4 ½" Surface Mount Box (Interior)

## Package #5

Door Description: Single door barrier free washroom or universal washroom (Interior)

Quantity	Item Description
1	Standard Duty Model Operator
1	Push to Lock Kit – CX-WC13XSM
1	Emergency Call Kit – CX-WEC10K2
1	Electric Strike - <b>TO BE PROVIDED BY HARDWARE SUPPLIER</b>

## ACCESSORY ITEMS 1

QTY	Item Description
2	4 ½" x 4 ½" Wave Buttons with LED Indicator Stainless Steel Finish, with wave logo and "wave to open" – in lieu of standard buttons
2	4 ½" x 4 ½" Wireless Button Kit, includes transmitter & receiver, Stainless Steel Button with barrier free logo & "Push to Open" – in lieu of standard buttons
2	6" Round Button with surface mount box, stainless steel button with barrier free logo & "Push to Open" – in lieu of standard Buttons
2	6" x 6" Square Button with surface mount box, stainless steel button with barrier free logo & "Push to Open" – in lieu of standard Buttons

## ACCESSORY ITEMS 2

QTY	Item Description
2	Motion sensor activation – example: BEA Eagle
2	Safety Sensors Push and pull side ( see specifications) – Example: Optex OA-Edge-2 with LED indicator.
1	CX-33 Logic Relay
1	L021 lock out relay
1	Le21 lock out relay
1	24V Transformer

# Appendix C2

Part 2 of City of Toronto RFQ  
for  
Automatic Door Opener (ADO's)

Technical Specifications and Requirements for  
Deliverables

**This Agreement** entered into on the **[Note to Finalization before Execution: Insert Date of Execution]**

between

**CITY OF TORONTO**

**(“City”)**

and

● **[Note to Finalization before Execution: Insert Legal Name of Supplier]**

**(“Supplier”)**

**WHEREAS** the City prequalified general contractors to carry out Work for the City's Accessibility Upgrades Program through a separate Request for Supplier Qualification process, and intends to contract with some or all of those prequalified general contractors through a competitive tender process that will lead to accessibility upgrades of approximately 350 City buildings under the Accessibility Upgrades Program, including installation of automatic door openers and other equipment at some locations;

**WHEREAS** the City wishes to pre-select a supplier for the supply, delivery and installation of automatic door openers and necessary equipment for the City's Accessibility Upgrades Program ("Deliverables");

**WHEREAS** the City issued Request for Quotations No. **[Note to Finalization before Execution: insert RFQ No.]** dated **[Note to Finalization before Execution: insert RFQ date]** including Addendum No. **[Note to Finalization before Execution: insert any addenda numbers and their respective issuance dates]** respectively, (collectively the "RFQ") and in response to the RFQ, the Supplier submitted a response dated **[Note to Finalization before Execution: insert RFQ submission date]** ("RFQ Response"); and

**WHEREAS** the Supplier will be required to enter into direct contracts with General Contractors in order to provide Deliverables;

**WHEREAS** the City and Supplier now wish to enter into this Agreement to establish the terms and prices under which the Supplier will provide Deliverables;

**NOW THEREFORE** in consideration of the mutual covenants herein contained, the City and the Contractor agree as follows:

## **1. DEFINITIONS**

The definitions contained in the RFQ are incorporated into and form a part of this Agreement in addition to the following definitions:

**"Accessibility Upgrades Program"** means the City's accessibility upgrades program for approximately 350 City buildings, including the installation of new Equipment in some buildings.

**"Automatic Door Opener Supply Contract"** means any contract between the Supplier and a General Contractor retained by the City for Work to be provided for the Accessibility Upgrades Program.

**"Contract Documents"** have the meaning in section 3 of the Agreement.

**"Deliverables"** has the meaning set out in the recitals and further defined in the RFQ.

**"Equipment"** means the automatic door openers and other necessary equipment to be supplied by the Supplier as part of the Deliverables.

**"General Contract"** means a contract that the Supplier enters into with a General Contractor for the purpose of providing Work/Services with respect to Equipment for the Accessibility Upgrades Program.

**"General Contractor"** means a prequalified general contractor retained by the City for the Accessibility Upgrades Program.

**"Warranty Period"** has the meaning set out in Appendix B of the RFQ.

**"Work"** means the work being performed by General Contractors.

## **2. THE DELIVERABLES AND WORK**

- (1) The Supplier will do and fulfill everything indicated in the Contract Documents.
- (2) The Supplier agrees to provide the Deliverables under any Automatic Door Opener Supply Contract under the terms and prices set out in the RFQ, RFQ Response, and this Agreement.
- (3) The Supplier acknowledges and agrees that the City does not guarantee the value or volumes of work and that this Agreement forms a standing offer to the Supplier that is subject to the City entering into an a General Contract.
- (4) In the event the Supplier enters into an Automatic Door Opener Supply Contract, the Supplier shall provide warranty for and maintenance services to the Equipment provided under said Automatic Door Opener Supply Contract to the City, pursuant to the RFQ.

## **3. CONTRACT DOCUMENTS**

The Agreement is comprised of the following Contract Documents, which are incorporated by reference. The following is a list, in order of precedence of the Contract Documents. In

the event of any inconsistency between, or an omission or ambiguity with respect to any provisions contained in any of the following Contract Documents, the following documents shall apply and prevail in the following order of priority to the extent of such conflict, inconsistency, mission, ambiguity or incongruity:

- (a) any duly authorized amendments to the Agreement;
- (b) the Agreement;
- (c) addenda to the RFQ in the order of most recent date issued;
- (d) RFQ; and
- (e) RFQ Response.

Should any discrepancies appear or differences of opinion or misunderstanding arise as to the meaning of the Agreement or as to any omissions therefrom or statements therein in any respect, or as to the quality or dimensions or sufficiency of the Equipment, materials, services or work or any part thereof, or as to the due and proper execution of the Contract Documents, the same shall, subject to the terms of the Contract Documents, be determined by the City.

#### **4. RELATIONSHIP OF THE PARTIES**

The Supplier, in providing the Services for the Work to be performed by the General Contractor under the General Contract, shall and is deemed to be an independent contractor to the General Contractor and not the agent or employee of the City and nothing in the RFQ or Contract Documents shall be deemed or construed as creating any such relationship. Neither is there any intention to create a partnership, joint venture or joint enterprise between the Supplier and the City.

#### **5. GENERAL CONTRACTOR'S OBLIGATIONS**

- (1) The Supplier acknowledges that upon award of a General Contract by the City to a General Contractor, the General Contractor shall be responsible for:

- (a) procuring the Deliverables from the Supplier; and
- (b) making all payments for the Deliverables;

all as if the General Contractor had selected the Supplier for the Services.

- (2) The Automatic Door Opener Supply Contract from the General Contractor shall be in accordance with the scope, terms and conditions of these RFQ Documents.
- (3) The Supplier acknowledges that General Contractors will be required to enter into General Contracts with the City in the form of agreement set out in Appendix D to the RFQ.

#### **6. PAYMENT TO SUPPLIER FOR DELIVERABLES**

- (1) The Supplier acknowledges the General Contractor will be responsible for paying the Supplier for all payments with respect to the supply of the Deliverables, and the General Contractor will be responsible for making all payments to the Supplier for the Deliverables in accordance with the terms of payment, as described herein, from, but

not necessarily limited to, money received by the General Contractor from the City in payment for the supply of the Deliverables under the General Contract.

- (2) The City shall pay the General Contractor for the supply of the Deliverables, subject to the holdback provisions of the *Construction Act, R.S.O. 1990*.
- (3) The selection of the Equipment and the Supplier by the City pursuant to this RFQ, or the approval of payment under the General Contract for the supply thereof, shall in no way constitute a waiver by the City of its rights to return or reject such Equipment and/or claim damages for: (a) non-compliance with the terms of the RFQ Documents, (b) breach of an expressed or implied warranty or guarantee, or (c) the enforcement of any contractual, legal, equitable or other rights which the City may have under the Contract Documents or General Contract.

## **7. REPRESENTATIONS AND WARRANTIES**

- (1) Without limiting or restricting in any way any other responsibilities and obligations of the Supplier under the Contract Documents, the Supplier represents, warrants and guarantees to the City and shall warrant to the General Contractor (and acknowledges that the City and the General Contractor is relying thereon) that any Deliverables resulting from or to be supplied or developed under the Automatic Door Opener Supply Contract and all Equipment, and the supply thereof:
  - (a) shall be in strict accordance with all applicable Laws and the City's functional and technical requirements set out in the RFQ including, without limiting the generality of the foregoing, the specifications for the said Equipment, and will function or otherwise perform in accordance with such requirements;
  - (b) shall be free from defects in design, engineering, material, manufacture, workmanship or title;
  - (c) shall perform efficiently and without unwanted interruption during the Warranty Period; and
  - (d) shall have any breakage, damage, defects or deterioration (other than those due to the negligence of the General Contractor or the City or to normal wear and tear) in the Equipment that occurs or is detected and is reported to the Supplier within the Warranty Period made good promptly by the Supplier at its expense including the expense of all necessary labour, supervision, travelling, replacement parts, transportation and otherwise.
- (2) All representations, warranties and guarantees provided herein are in addition to any other representations, warranties and guarantees contained in the Supplier's RFQ Response, including manufacturer's warranties, and all such representations, warranties and guarantees shall be completely transferable by the General Contractor to, and completely enforceable by, the City.
- (3) No inspection, examination, test, acceptance or use of all or any part of the Equipment or services furnished hereunder nor the failure to inspect, examine or test the same nor acceptance thereof nor the expression of any approval by the General Contractor, or by the City pursuant to the General Contract or otherwise, shall constitute acceptance of any defect or shall affect the Supplier's obligation under these warranty provisions, or

be deemed to relieve Supplier from any of its obligations under the Contract Documents, including among others the obligation to supply the Equipment and services satisfying the warranties set forth herein. Such warranties shall survive inspection, test, acceptance and use.

- (4) The Supplier agrees that all representations, warranties and guarantees provided in the Agreement and which are to be incorporated into the Automatic Door Opener Supply Contract, are fully assignable to and enforceable by the City (where not already expressly reserved to the City) at the City's sole option and further agrees that the City's right to a complete assignment of same shall be included in the Automatic Door Opener Supply Contract, without any additional compensation payable by the City (including indirectly by the General Contractor) or further approval by the Supplier. The Supplier acknowledges that the City is relying on the representations, warranties and guarantees of the Supplier and, but for same, the City would not have selected the Equipment or Supplier. The Supplier's representations, warranties and guarantees herein shall run to the City, its successors, and assigns.

## **8. DEFECTIVE EQUIPMENT, SERVICES**

- (1) In the event of failure of the Equipment or any part or parts or supply thereof, during the Warranty Period, due to defects of design, materials, or workmanship or other breach of a representation or warranty provided herein, the affected Equipment, or part or parts or supply thereof, shall be replaced promptly upon notice by the General Contractor or the City. All replacement parts shall be furnished, delivered, and installed at the expense of the Supplier.
- (2) Upon receipt of any notice of defect from the General Contractor, the Supplier, at its own expense, shall immediately:
- (a) correct; or
  - (b) re-perform; or
  - (c) replace and fit with new parts; or
  - (d) repair and refit,
- or any combination of the foregoing, without cost or charge to the General Contractor or the City,
- (i) any error, defect, deficiency or malfunction in the Equipment, or any parts, materials or workmanship thereof or services related thereto supplied by the Supplier; or
  - (ii) non-conformance of the Equipment or the supply thereof with the warranty provisions set forth herein or other requirements of the Contract Documents,
- upon notification of the Supplier by the General Contractor or the City within Warranty Period.
- (3) Notwithstanding subsection (2) above, should the Equipment fail to meet the representations and warranties set forth herein in any material respect, such failure shall be deemed cause for the rejection and removal of the unit and for its replacement with an acceptable unit, and the City shall be entitled to require the General Contractor

to do so at the sole option of the City, which shall be done at the sole expense of the General Contractor, and if appropriate, the Supplier.

- (4) The Supplier's obligation herein shall include, without limitation, all transportation costs for parts and/or Equipment both ways between the Supplier's factory or repair depot and the point of use. In the case of remedial work to be performed by Supplier hereunder, the Supplier shall provide all labour, supervision, equipment, tools and materials necessary to perform the remedial work and shall bear all expenses in connection therewith or incidental thereto. The Supplier shall perform, at its own cost, such tests as may be reasonably required to verify that corrected, repaired or replaced Equipment conforms to the warranties above.
- (5) Subject to subsection (3) above, if the Supplier chooses to effect a repair under subsection (2) it shall immediately fit a replacement part to enable the Equipment to continue in use until the original part has been repaired and refitted.
- (6) The City will provide the General Contractor reasonable access to such Equipment to assist the General Contractor or Supplier in having work carried out on installed Equipment or in removing or replacing installed Equipment or parts thereof.
- (7) Any Equipment or service or part thereof that is corrected, replaced or repaired in accordance with the warranty provisions herein shall carry and be subject to the same warranty terms as set forth herein, except that the Warranty Period shall start from the date on which the correction, re-performance, replacement or repair is completed and the Equipment is properly operational.
- (8) The Supplier acknowledges that the failure of the Equipment, or any part thereof, to operate and perform properly and in accordance with the warranties provided herein could result in disruption of the Project and substantial revenue loss to City. The Supplier agrees to use its best efforts to perform all warranty work hereunder as expeditiously as is reasonably possible and in a manner which minimizes Project disruption and revenue loss. The Supplier recognizes and agrees that City's operational requirements may require immediate repairs or reworking of defective goods, without notice to the Supplier and without affecting the City's warranty rights hereunder. In such event, the Supplier shall reimburse the City and shall be required to reimburse the General Contractor all costs, delays, or other damages which the City has incurred as a result of such failure. In the event of an emergency breakdown, the Supplier shall attend the location of the emergency breakdown within twenty-four (24) hours of the incident being reported, failing which the City shall have the right to undertake repairs as required and charge the Supplier the cost of the repairs. Subject to subsection (7) above, the Supplier's responsibility shall be discharged when the City is satisfied that the necessary correction, replacement or repair has been properly effected, subject to any warranty applicable thereto.
- (9) The Supplier shall be liable for all damage, loss or expense arising from any failure of the Equipment or delay or failure to perform warranty work hereunder or in restoring the Equipment to working order.
- (10) Nothing in this section shall be construed, in any way, to prejudice or limit the City's contractual rights under the Agreement or the General Contract or any equitable or common law rights available to it.

## 9. PERFORMANCE

In addition to any other provision concerning the performance and personnel of the Supplier:

- (1) Under the Automatic Door Opener Supply Contract:
  - (a) the Supplier shall make available appropriately skilled workers, consultants or subcontractors, as appropriate, and must be able to provide the necessary materials, tools, machinery and supplies to fulfill its obligations to supply the Equipment in accordance with the terms and conditions of the Contract Documents.
  - (b) Without limiting the foregoing, the Supplier shall be responsible for complying with the *Occupational Health and Safety Act* (OHSA) at all times during the supply of the Deliverables. The City shall in no way be considered the constructor with respect to any part of the supply of Equipment for the purposes of the OHSA.
  - (c) It shall be the Supplier's responsibility to co-ordinate, control and check the work of and the provision of the goods and services by its own forces and of all its subcontractors and to ascertain that all work is performed in accordance with all requirements of the Contract Documents. Without limiting the generality of any other provision herein, the Supplier shall be liable for all costs or damages arising from acts, errors or omissions, negligence or wilful misconduct of its subcontractors.
- (2) The City shall not be construed to have any contractual relationship with any of the Supplier's employees or subcontractors or material suppliers or their employees or supplier.
- (3) The City's general conditions for its General Contract are included in Appendix D to the RFQ and will form part of the General Contract. The Supplier agrees to be bound by the terms and conditions contained therein as they affect the supply of the Deliverables to the Work and the Supplier as a subcontractor to the General Contractor.
- (4) Any Equipment, services, work, material or incidentals, not explicitly specified in the RFQ Documents but which are necessary to conform to generally accepted industry, safety or product standards, good construction practice, to produce a finished appearance, or required by the Ontario Building Code or other governing codes, or which may be fairly implied as "included", shall be done or supplied by the Supplier as if such Equipment, services, work, material or incidentals had been explicitly specified.

## 10. COMPLIANCE WITH LAWS

- (1) The Supplier, at all times, shall comply with and conform to all statutes, laws, by-laws, regulations, requirements, codes, ordinances, notices, rulings, orders, directives, policies and controls of the municipal, provincial and federal governments and any other lawful authority and all court orders, judgments and declarations of a court of competent jurisdiction (collectively referred to as the "Laws"), applicable to the Equipment and the supply thereof, and the responsibilities and obligations of, the Supplier under the Contract Documents. The Supplier shall ensure that all persons performing the supply of the Deliverables to the Work hold all valid and current permits, licences (including municipal), consents and approvals required by Law with respect to such services to be provided and/or Equipment to be supplied by them.

- (2) The Supplier, at all times, shall cooperate with the General Contractor and the City, as Owner, in promptly furnishing any information that may be required by the Ministry of Labour and any other government regulatory authority with jurisdiction over any matter applicable to the supply of the Deliverables.

#### **11. W.H.M.I.S.**

The Equipment shall be supplied in compliance with Canada's Workplace Hazardous Materials Information System (W.H.M.I.S.). Without exception, all Equipment and all parts and material comprising same shall be ASBESTOS-free and TAR-free.

#### **12. PROHIBITED PRODUCTS**

- (1) The Supplier must provide the General Contractor with a list of designated substances that will be brought to the Work Site prior to commencing the supply of the Deliverables to the Work. The tender for the General Contract will require that the General Contractor maintain at the Project site, copies of all Materials Safety Data Sheets (MSDS) and an inventory of hazardous materials for each substance on the Project.
- (2) Hazardous products and materials containing any Class A1 carcinogen substance, as indicated in their appropriate Material Safety Data Sheets, shall not comprise any part of the Equipment, or the supply thereof, and are prohibited from City property and the Work Site.
- (3) The Supplier agrees to fully indemnify and save harmless the City, its employees and consultants and the General Contractor from any and all charges, fines, penalties and costs that may be incurred or paid by the City or the General Contractor, as the case may be, or any of their respective employees or if the City or the General Contractor or any of their respective employees shall be made a party to any charge under the *Occupational Health and Safety Act* in relation to any violation of such Act arising out of the supply of the Deliverables.

#### **13. OWNERSHIP OF PROJECT DOCUMENTATION**

All information, data, plans, specifications, reports, estimates, summaries, photographs and all other documentation prepared by the Supplier specifically in the connection with the supply of the Deliverables, whether they are in draft or final format, shall be the property of the General Contractor, upon delivery of such documents to the General Contractor, which shall be completely and absolutely transferable to the City under the General Contract.

#### **14. PATENT AND COPYRIGHTS**

- (1) Where the supply and incorporation of the Equipment, or any component thereof, to the Work and use of such Equipment, or any component thereof, requires the installation or use of any patented, trademarked, copyrighted or other protected intellectual property ("Intellectual Property"),
  - (a) belonging to the Supplier, the Supplier shall grant to the General Contractor an irrevocable and perpetual license to permit the General Contractor to use such Intellectual Property for the supply, installation and use of the Equipment and all components thereof, as contemplated in the Contract Documents, which licence

shall be completely assignable to the City upon acceptance of the Equipment by the City;

- (b) belonging to any other person, the Supplier shall acquire from and pay for the an irrevocable and perpetual license from the owner thereof entitling the General Contractor to use such third party Intellectual Property for the supply, installation and use of the Equipment and all components thereof, as contemplated in the Contract Documents, which licence shall further be completely assignable to the City, upon acceptance of the Equipment by the City.
- (2) The Equipment price shall include all payments made or to be made or required to be made for the use of any and all Intellectual Property, as provided in subsection (1) above.
- (3) The Supplier, at its sole expense, shall defend, indemnify and save harmless the City, and its employees, officers, consultants and agents, from all and every claim, action or proceeding for damages, costs (including legal fees on a substantial indemnity basis), charges, expenses, royalties, or fees for the alleged infringement or infringement of any patent, trademark, trade secret, copyright or other proprietary right occasioned by them in connection with the supply of the Deliverables by the Supplier or the installation or use of the Equipment by the General Contractor or the City, as contemplated in this Agreement, as well as for any alleged unfair competition resulting from similarity in design, trademark or appearance of goods or services furnished hereunder. The City may, at its option, be represented at any such proceeding.
- (4) If the Equipment or the supply of the Deliverables or the installation or use of the Equipment is held in any such claim, action or proceeding to constitute an infringement, the Supplier, at its expense and in compliance with the Specifications, shall forthwith either procure for the General Contractor or the City, as the case may be, the right to use and continue to use such material or Equipment; or replace same with substantially equal but non-infringing material and Equipment; or modify same to make them substantially equal but non-infringing; or remove same and refund the purchase price and transportation and installation costs and all other costs of the General Contractor or the City related to the removal and loss of use.

## 15. CONFIDENTIALITY

All correspondence, documentation and information of any kind provided by City, or by any other person on the City's behalf including its consultant, contract administrator or General Contractor, to or which comes to the attention of the Supplier in connection with, or arising out of, or by reason of the RFQ or the supply of the Deliverables remains the property of the City; must be treated as confidential; and must not be used for any purpose other than as contemplated herein and shall not be reproduced, disclosed or disseminated, except as required by Law or as expressly permitted in advance by the City in writing. The RFQ is subject to the *Municipal Freedom of Information and Protection of Privacy Act*, R.S.O. 1990, c. M.56, as amended.

## 16. SPARE PARTS

The Supplier shall maintain a complete inventory of spare parts commonly needed for the Equipment specified at a location within the Province of Ontario or, alternately, spare parts

must be made available to the General Contractor within 48-hours of any spare part order by the General Contractor during the Warranty Period and, after the Warranty Period, to the City, as soon as reasonably possible but no later than within 30 days. The Supplier represents and warrants that such spare parts inventory shall be maintained for the Equipment for a period of no less than ten (10) years or the life cycle for the Equipment quoted by the Supplier in its RFQ Response, whichever is greater.

## **17. LATE DELIVERY/LIQUIDATED DAMAGES**

- (1) The City accepts no responsibility for any claim made by the General Contractor against the Supplier on account of actual damages or additional costs incurred, or allegedly incurred, by the General Contractor on account of late delivery by the Supplier of any item of Equipment or the Deliverables. Any dispute between the Supplier and the General Contractor with respect to any such claim shall be settled between the Supplier and the General Contractor.
- (2) Failure to meet the completion schedule will subject the Supplier to damages, including liquidated damages, in accordance with the General Contract. The liquidated damages assessed by the City against the General Contractor for failure to complete the project within the Contract Time stipulated in the General Contract shall be determined by the City for each General Contract. The General Contractor shall have the right to assess this amount against the Supplier to the extent the Supplier is the reason for any portion of the delay in completion. This is without prejudice to any other remedy of the City or the General Contractor in contract or otherwise at law.

## **18. TRANSFER OF TITLE**

The title to Equipment, components, and materials to be furnished in accordance with the Contract Documents including replacements or substitutions shall pass to the General Contractor upon its acceptance of the Equipment. The passing of the title to the General Contractor (or the subsequent transfer of the Equipment to the City) shall not relieve Supplier from any other liabilities or obligations under the Automatic Door Opener Supply Contract or the Agreement, which shall remain in full force and effect.

## **19. STORAGE OF EQUIPMENT**

The Supplier shall coordinate the storage of the Equipment at the Work Site with the General Contractor. The Supplier shall be responsible for providing the General Contractor with full instructions in writing of all precautions to be observed in connection with the storing and protection of the Equipment. A copy of all instructions shall be provided to the Contract Administrator. The General Contractor will be responsible for proper storage of the delivered and accepted Equipment, appurtenances and materials until it is installed and for their protection against weather, deterioration, loss, damage or theft.

## **20. COORDINATION WITH WORK BY OTHERS**

- (1) The Supplier shall cooperate and liaise with the General Contractor to make appropriate working arrangements to ensure the satisfactory execution and timely completion of the supply of the Deliverables and related services.

- (2) The City shall provide the General Contractor reasonable access to the Work site necessary to enable the Supplier to complete the supply and services herein.

## **21. UNPAID ACCOUNTS AND LIENS**

- (1) The Supplier shall be required to covenant to the General Contractor to pay all charges incurred by or on behalf of the Supplier for any services, work or materials which may be supplied, done or performed in respect of the supply of the Deliverables and the Supplier shall be required to forthwith discharge and obtain a release of any liens or encumbrances whatsoever arising therefrom at any time claimed or registered against or in respect of the supply of the Deliverables or any part thereof. In the event that the Supplier shall fail to cause any such liens or encumbrances forthwith to be discharged and released after being notified thereof, then, in addition to any other right or remedy of the General Contractor, the General Contractor may, but shall not be obliged to, discharge same by paying the amount claimed to be due and any other amounts necessary to obtain such a discharge and the amount so paid by the General Contractor and all costs and expenses, including reasonable legal fees on a substantial indemnity basis, incurred by the General Contractor in procuring the discharge and release of such lien or encumbrance, shall be payable by the Supplier forthwith.
- (2) The Supplier shall be required to indemnify the General Contractor from all claims arising out of unpaid accounts relating to the supply of the Deliverables including any claims of the City. The General Contractor shall have the right at any time to require satisfactory evidence that the work in respect of which any payment has been made or is to be made by the General Contractor to the Supplier is free and clear of liens, attachments, claims, and demands, charges or other encumbrances.
- (3) In the event that the Supplier shall fail to cause any liens or encumbrances any time claimed or registered against the lands of the Owner in respect of any improvement which the supply of the Deliverables may constitute under the *Construction Act*, R.S.O.1990 to be discharged and released forthwith after being notified thereof, then, in addition to any other right or remedy the City may have by contract, law, statute or in equity, the City may, but shall not be obliged to, discharge same by paying the amount claimed to be due and any other amounts necessary to obtain such a discharge and the amount so paid by the City and all costs and expenses, including reasonable legal fees on a substantial indemnity basis, incurred by the City in procuring the discharge and release of such lien or encumbrance, shall be payable to the City by the Supplier and the General Contractor forthwith. The City shall have the right at any time to require satisfactory evidence that the work in respect of which any payment has been made or is to be made by the City to the General Contractor is free and clear of liens, attachments, claims, and demands, charges or other encumbrances.

## **22. INDEMNIFICATION**

- (1) In consideration of the Supplier being pre-selected by the City for the supply of the Deliverables to the Work under the General Contract, the Supplier covenants and agrees at all times to defend, fully indemnify and save harmless the General Contractor, the City, their councillors, officers, directors, employees, agents and representatives, successors, and assigns (hereinafter called the "Indemnitees") from and against any and

all claims of any nature whatsoever and howsoever caused to, sustained or suffered by, or imposed upon or made or instituted against any of the Indemnitees or to which any of them may be liable by reason of or arising from or related to:

- (a) any act or omission, neglect, default or wilful misconduct on the part of the Supplier as well as any officer, employee, servant, subcontractor, consultant, invitee, agent or assign of the Supplier relating to the supply of the Deliverables; or
  - (b) attributable to or connected with the performance, non-performance or purported performance of the Supplier's obligations pursuant to the Automatic Door Opener Supply Contract; or
  - (c) in consequence of or in any way arising out of any defect in the Equipment; or
  - (d) by reason of any default, breach, violation, misrepresentation, non-performance or non-compliance of or with any covenant, term, obligation, warranty (express or implied), condition or provision in or related to the Agreement or the Automatic Door Opener Supply Contract by the Supplier, or
  - (e) any infringement or alleged infringement or other breach, actual or alleged of any Canadian, American or other patent, industrial design, trade secret, trademark, copyright, service mark, trade name, official mark, moral right or any other intellectual property right of any person conferred by contract, common law, statute or otherwise, for which the Supplier is responsible or which is occasioned by the Supplier in connection with the supply of the Deliverables or material to the Work and related services performed by it under the Agreement or the Automatic Door Opener Supply Contract, or anyone else for whom at law it is responsible; or
  - (f) breach of any confidentiality obligations under the Automatic Door Opener Supply Contract, except to the extent that the same are directly caused by the negligence or deliberate wrong-doing of the General Contractor.
- (2) In the event any claim is asserted in respect to which any of the Indemnitees is entitled to indemnification under this section, without prejudice to any other right or remedy it may have, the General Contractor shall be entitled to deduct or withhold a reasonable sum on account of such claim, including legal costs, from monies owed or payable by the General Contractor to the Supplier under the Automatic Door Opener Supply Contract, pending the final determination or settlement of such Claim.
- (3) Upon assuming the defence of any claim covered under this section the Supplier shall keep the party or parties entitled to indemnification herein reasonably informed of the status of the matter, and the Supplier shall make no admission of liability or fault on any GC Indemnitee's part without prior written consent the party or parties entitled to indemnification herein.
- (4) The rights to indemnity provided for in this section shall be deemed to be in addition to and not in lieu of any insurance to be provided by the Supplier and any rights with respect to insurance in favour of the General Contractor. The rights to indemnity provided herein shall survive the expiration or any termination of the Automatic Door Opener Supply Contract.

- (5) The Supplier acknowledges and agrees that the City, at its option, shall have the right to an assignment of the General Contractor's rights of indemnification herein related to the supply of the Deliverables and may directly enforce such rights against the Supplier.

## **23. INSURANCE**

- (1) The Supplier shall comply with all insurance requirements, and all WSIB prior to the execution of this Agreement. The Supplier shall bear all costs, expenses, losses and damages of its own and those of the General Contractor and the City, which may arise as a result of the Supplier failing to or delaying in promptly complying with this condition.

- (2) The Supplier agrees to purchase and maintain in force, at its own expense and for the duration of the Agreement, the following policies of insurance, which policies shall be in a form and with an insurer acceptable to the City. A certificate evidencing these policies signed by the insurer or an authorized agent of the insurer must be delivered to the City prior to the commencement of services:

- (a) Commercial General Liability provided that the policy:

- (i) is in the amount of not less than Five Million Dollars (\$5,000,000.00), per occurrence;
- (ii) adds the City of Toronto as an additional insured;
- (iii) includes Non-Owned Automobile Liability, Employer's Liability and/or Contingent Employer's Liability, and any other provision relevant to the services;
- (iv) includes a clause which will provide the City with thirty (30) days' prior written notice of cancellation (15 days if cancellation is due to non-payment of premium).

- (b) Automobile Liability insurance with a minimum limit of Two Million Dollars (\$2,000,000) for all owned or leased licensed motorized vehicles used in the performance of services.

- (3) It is understood and agreed that the coverage and limits of liability noted above are not to be construed as the limit of liability of the vendor in the performance of services. It is also agreed that the above insurance policies may be subject to reasonable deductible amounts, which deductible amounts shall be borne by the vendor. At the expiry of the policies of insurance, original signed Certificates evidencing renewal will be provided to the City without notice or demand.

- (4) The Supplier is responsible for any loss or damage whatsoever to any of its materials, goods, equipment or supplies and will maintain appropriate all-risk coverage as any prudent owner of such materials, goods, supplies and equipment. The Supplier shall

have no claim against the City or the City's insurers for any damage or loss to its property and shall require its property insurers to waive any right of subrogation against the City.

## **24. CONTRACT CANCELLATION**

- (1) The City may cancel the Agreement between the City and the Supplier for any reason, prior to the execution of the Automatic Door Opener Supply Contract, without any financial obligation to the Supplier. Should for any reason the City not enter into a General Contract which includes the supply of the Deliverables, then the City will notify the Supplier in writing and the Supplier for this Project will be cancelled without any financial obligation to the Supplier.
- (2) In the event of any cancellation, the Supplier shall immediately stop all work related to the Supply Contract, and shall immediately cause any and all suppliers and subcontractors to do the same.
- (3) In the event of any cancellation the City shall not incur any liability to the Supplier apart from payment to the General Contractor, which the General Contractor shall pay over to the Supplier, of the reasonable costs directly incurred by the Supplier for Equipment, work or services that have been satisfactorily delivered or performed by the Supplier prior to the notice of cancellation. Such reasonable costs incurred shall be supported by audit, if necessary, carried out by auditors acceptable to the City, prior to payment of same. Neither the City nor General Contractor shall be liable to the Supplier for loss of anticipated profit on the cancelled portion or portions of the General Contract or the supply of the Deliverables. Neither the City nor General Contractor shall be liable to the Supplier for consequential, economic or indirect losses or damages arising as a result of such cancellation.
- (4) The Supplier shall not be paid for any Equipment supplied or services or work done after receipt of the notice of cancellation or for any costs incurred by the Supplier or its suppliers or subcontractors which such persons could reasonably have avoided or mitigated. The Supplier shall not unreasonably anticipate the requirements of a Purchase Order for the Equipment.

## **25. CHANGES IN THE WORK**

The City may, without invalidating the Agreement or General Contract, direct the General Contractor to make changes to the work which may include changes to the supply of the Deliverables by the Supplier. When a change causes an increase or decrease in the Work related to the supply of the Deliverables, the Deliverables price shall be increased or decreased by the application of RFQ Response prices to the quantum of such increase or decrease, or in the absence of applicable RFQ Response prices, by an amount to be agreed upon between the City and the General Contractor and correspondingly between the General Contractor and the Supplier, under their respective contracts. All such changes shall be in writing. The General Contractor shall, without invalidating the Automatic Door Opener Supply Contract, have the right to make a corresponding change in the Automatic Door Opener Supply Contract.

**26. NON-WAIVER**

No condoning, excusing or overlooking by the General Contractor under the Automatic Door Opener Supply Contract, or the City under this Agreement, of any default, breach or non-observance by the Supplier at any time or times in respect of any provision herein contained shall operate as a waiver of the General Contractor's or the City's right, as the case may be, hereunder in respect of any continuing or subsequent default, breach or non-observance, or so as to defeat or affect in any way the rights of the General Contractor or City herein in respect of any such continuing or subsequent default or breach. No waiver shall be inferred from or implied by anything done or omitted by the General Contractor or the City, save only by express waiver in writing. The doing of anything by the General Contractor required by the Automatic Door Opener Supply Contract to be done by the Supplier shall not relieve the Supplier of its continuing obligation to do that thing. No delay or omission by the City in exercising any right or remedy shall operate as a waiver of them or of any other right or remedy, and no single or partial exercise of a right or remedy shall preclude any other or further exercise of them or the exercise of any other right or remedy.

**27. SUCCESSORS AND ASSIGNS**

- (1) All terms, covenants, conditions and provisions provided herein relating to the Automatic Door Opener Supply Contract shall be binding upon and shall enure to the benefit of the Supplier and their respective permitted assigns, successors and legal representatives.
- (2) The Supplier shall not assign, subcontract, transfer or encumber in any manner or part of the Automatic Door Opener Supply Contract or any interest therein without the prior written consent of the General Contractor, which consent shall not be unreasonably withheld. Any attempt to assign, transfer or encumber any of the duties or obligations of Supplier without such consent is void.
- (3) Any delay in the commencement of the supply of the Deliverables or in the performance of any related services or the Supplier's obligations under the Automatic Door Opener Supply Contract related to or arising from the General Contractor's consideration of the Supplier's request for an assignment, transfer or encumbrance in any manner or part of the Automatic Door Opener Supply Contract or any interest therein or a subcontractor change and the costs of same shall be solely borne by the Supplier.
- (4) No assignment or subcontracting by the Supplier shall, in any circumstances, relieve the Supplier from any responsibility for the full performance of all of its responsibilities and obligations and undertaking of its liabilities under the Automatic Door Opener Supply Contract and this Agreement. Notwithstanding the approval of any subcontractors by the General Contractor, the Supplier shall be fully responsible for every subcontractor's performance, activities, work, acts or omissions as if the Supplier were performing the subcontracted portion of the supply of the Deliverables with its own resources.
- (5) The General Contractor(s) shall be responsible to the City for the performance of all of its subcontractors, including the Supplier. The City shall require any and all such subcontractors to sign agreements with the General Contractor that bind the subcontractors to abide by the terms and conditions hereof. Upon the request of the City, the General Contractor shall furnish the City with copies of such agreements.

**28. NON-EXCLUSIVE REMEDIES**

The rights and remedies of the City provided in the Contract Documents shall not be exclusive and are in addition to any other rights and remedies provided by contract, law or in equity, including the right of specific performance and offset.

**29. FURTHER ASSURANCES**

The Supplier shall draw, execute and deliver at its own expense, all such instruments and documents, and do all such acts and things as the General Contractor or City may from time to time reasonably consider necessary or advisable for the purpose of carrying out the intent and provisions of the Contract Documents.

**30. GOVERNING LAW**

The Contract Documents shall be governed by, subject to and construed in accordance with the laws of the Province of Ontario and the laws of Canada, as applicable to the matters herein. Any action or other legal proceeding arising under or with respect to the Contract Documents (including any motion or other interlocutory proceeding) shall be brought in a Court or a tribunal, whichever may be applicable, sitting in Toronto, Ontario. The Supplier and the City each irrevocably submit to the exclusive jurisdiction of the courts of the Province of Ontario in accordance with the foregoing.

**31. SEVERANCE WHERE PROVISION ILLEGAL, ETC.**

If any provision or provisions of the Contract Documents or parts thereof or the application thereof to any person or circumstances shall be found is/are found to be invalid, unenforceable or void by any court or tribunal of competent jurisdiction, such provision or provisions or parts thereof shall be deemed severable and all other provision or provisions or parts of the Contract Documents shall be deemed to be separate and independent therefrom and continue in full force and effect unless and until similarly found void and/or unenforceable. The remaining terms and provisions of the Contract Documents and its application to any person or circumstances shall not be affected thereby, but this provision shall apply only insofar as the effect of that severance is not to change the fundamental nature of the obligations assumed respectively by each of the parties thereto.

**32. ENTIRE AGREEMENT**

This Agreement embodies and constitutes the sole and entire agreement between the parties hereto. There are no terms, obligations, covenants or conditions between the parties hereto, other than as contained herein. No alteration, amendment or modification hereof shall be valid unless executed by an instrument in writing by the parties. Neither this Agreement, nor any term hereof, can be changed, modified or abandoned, in whole or in part, except by such instrument in writing, and no subsequent oral agreement shall have any validity whatsoever.

### **33. COUNTERPART AND ELECTRONIC SIGNATURE**

This Agreement may be executed in counterpart and may be executed by electronic signature that is received by the City in a file format acceptable to the City. Such electronic signature shall be deemed to be an original signature for the purpose of this Agreement with the same legal effect as an original signature.

**[signatures on next page]**

The parties hereto have executed this Agreement by the hands of their duly authorized representatives.

**Re: Acoustical Review (Group 05)**  
**City of Toronto Accessibility Upgrades**  
**HGC Project Number 02002945**

---

Dear Mr. Haddad,

As requested, HGC Engineering has completed a review of the Issued for Permit drawing packages for the Group 05 buildings associated with the City of Toronto Accessibility Upgrades project.

### **Background for Acoustic Requirements**

The City of Toronto's Accessibility Design Guidelines, initially published in 2004 with draft modifications issued in October of 2016, presents in Section 3.3.1. concepts to be considered for acoustics. Those concepts do not replace good practices for acoustics and noise and vibration control in office and institutional buildings but, rather, they indicate where special attention should be paid in the design for persons with limited hearing or vision. Some of these individuals rely on acoustic cues for navigating spaces and thus it is desirable to provide reasonably low ambient sound levels, modest reverberation times, a lack of confusing sound reflections, and hard floor finishes that provide acoustic feedback along the principal accessible routes.

As the design of these accessibility upgrades progresses, it is also important to ensure that the upgrades do not introduce acoustic issues for the existing spaces and uses. Thus, the transmission of speech or annoying mechanical sound into acoustically sensitive office spaces and meeting rooms needs to be considered. This implies:

- Selecting demising constructions with adequate sound transmission class (STC) values based on the activities and sensitivities in the adjoining spaces (as detailed on G1002).
- Paying attention to details that avoid compromising the STC of a demising construction such as the addition of a baffle above ceiling tiles and adequate seals at the roof deck (as detailed on D1501 and D1502), cross talk silencers where ducts

- penetrate drywall or block partitions (detailed on D3501), and the appropriate selection and sealing of doors.
- Selecting mechanical equipment with attention given to the sound energy produced, adequately vibration isolating the equipment, and installing noise control hardware (silencers, etc.) where appropriate.
- Ensuring that plumbing piping is resiliently shielded where it passes through floor slabs and walls (as detailed on D3601) and is not in direct contact with drywall panels.

The acoustics within open office spaces is influenced by the selection of ceiling tiles to assist in achieving reasonable speech privacy, as is the provision of properly adjusted sound masking systems. The acoustical design for larger meeting rooms is critical to ensure good speech intelligibility.

### Group 05 Review

The accessibility upgrades for the Group 05 buildings tend to focus on improving the physical access at doors, stairs, and hardware, improvements in wayfinding, and in many cases the addition of accessible washrooms and/or upgrades to other washrooms. The new Paramedics Station at 160 Rivalda Road, is adding a new meeting room and a new training room. Two of the buildings in this group, the Police No. 33 Division at 50 Upjohn Road and Paramedics Station at 160 Rivalda Road are having elevators added.

The new washrooms have been provided with adequate STC walls in areas where new walls have been provided adjacent to sensitive spaces. Any new washroom exhaust fans have acceptable noise ratings (<2.5 sones). The new meeting and training rooms have been provided with adequate STC walls and appropriate acoustic ceiling tiles.

The new elevators and associated mechanical equipment are in relatively noise insensitive areas of the buildings.

Where applicable, appropriate floor finishes have been provided on stairs and on access routes.

The Typical Details Booklet that covers this group presented details (as noted above) that properly address the acoustics for the buildings.

Table 1 provides the list of buildings and the major upgrades involved.

Table 1. Buildings in Group 05 and Key Upgrades Impacting Acoustics.			
Number	Use/Address	Washroom	Other/Comments
1	FIRE HALL NO. 121 10 WILLIAM CARSON CRESCENT	No new washrooms.	No mechanical upgrades.
10	FINCH YARD - BLDG A 1026 FINCH AVE W	New first-floor universal washroom and upgrades to men's changeroom and washroom, barrier-free washroom, and kitchen.	Acceptable new STC 45 walls specified where appropriate for washrooms. New exhaust fans for the first-floor universal washroom and janitorial room have acceptable sound power ratings (<2.5 sones).
30	DAVID DUNCAN HOUSE - RESTAURANT 125 MOATFIELD DR	New ground-floor universal washroom.	Acceptable new STC 45 walls specified for new washroom. No new fans.
48	CITY CLERK'S RECORD CENTER 14 DYAS RD.	Upgrades to barrier- free washroom.	No new fans.
59	FIRE HALL NO.123 143 BOND AVENUE	New universal washroom opening to apparatus bay.	Acceptable new STC 45 walls specified for washrooms. New exhaust fan for universal washroom has an acceptable sound power rating (<2.5 sones).
83	BUILDING 160 DUNCAN MILL RD.	Upgrades to first floor barrier-free washrooms and changerooms.	No new walls or fans.
86	NEW PARAMEDICS STATION 160 RIVALDA RD	Extensive renovations to basement, first floor (warehouse), and upper floor. New basement changerooms and barrier-free washrooms. New universal washroom on first floor. New meeting and training rooms on upper level.	Two new split system (indoor/outdoor) air- conditioning systems serving the Meeting room 136 and Training Room 129, with maximum rated sound levels for the indoor Mitsubishi units of 37 dBA. Three new energy recovery units added to serve change room in basement, and meeting room and training room on upper level. New hydraulic elevator to serve basement, first and upper floors, opening on to warehouse and noise-insensitive corridors, with new rooftop air-conditioning unit and rooftop exhaust fan to service elevator shaft. Walls with acceptable STC 45 rating selected for new partitions on basement and upper floors with appropriate acoustic ceiling tiles

			in the meeting and training rooms to control reverberation.
107	UPJOHN BUILDING 2 DYAS RD.	Upgrades to first floor universal washrooms, and men's and women's washrooms and changerooms.	No new walls or fans.
149	FIRE HALL NO. 122 2545 BAYVIEW AVENUE	No new washrooms.	No Mechanical upgrades.
151	FIRE HALL NO. 116 255 ESTHER SHINER BLVD.	Upgrades to first floor men's and women's washrooms and.	No new walls or mechanical upgrades.
175	POLICE EMERGENCY TASK FORCE 300 LESMILL RD.	New ground-floor universal washroom.	Acceptable new STC 45 walls specified for new washroom. No new fans.
249	POLICE NO. 33 DIVISION 50 UPJOHN RD	One new barrier-free washroom on the first floor, modifications to two barrier-free washrooms on the first floor, and modifications to one barrier-free and one universal washroom on the third floor.	Where modified, new walls have adequate STC 45 rating. No new exhaust fans. New hydraulic elevator to serve first and third floor, opening on noise-insensitive corridors, with new rooftop air-conditioning unit and exhaust fan to service elevator shaft.
346	SHELTER 360 LESMILL RD.	Upgrades to first floor barrier-free washroom and barrier-free changeroom.	No new walls or fans.

All in all, it is concluded that the Issued for Permit drawing packages for the Group 05 buildings properly consider acoustics.

We trust this information is sufficient for your current needs. We look forward to reviewing the drawings for the future groups as they become available. In the meantime, please do not hesitate to call should you have any questions or concerns.

Yours truly,  
**Howe Gastmeier Chapnik Limited**

## SECTION-1: INTRODUCTION

This design guide is to provide consulting engineers, architects and designers working for the City of Toronto (CoT) with a document for the design of commercial facilities (owned, controlled, or leased buildings) communications distribution and structured cabling systems that accurately reflects the City of Toronto (CoT) and industry standards in effect as of this publication. This document shall be referenced to develop project specification and tender documents, specifically extra costs, and Bell standard pricing.

Therefore, it is obligatory for consulting engineers, architects, and designers of telecommunications systems of City of Toronto (CoT) to follow and practice the most updated revision to reflect the methods, materials and standards that have been used for providing telecommunications services to the existing facilities. The updated document also reflects changes in industry practice as of this publication.

In general, it is the responsibility of the building communications distribution designer to coordinate with the other designers on a project (architect, structural, electrical, mechanical, etc.) to ensure that other systems are both compatible with and complementary to the communications cabling system. The City of Toronto (CoT) design philosophy is that it is critical to coordinate between disciplines during the design phase of a project, rather than attempting to make adjustments in the field during construction.

Communications distribution systems designed for the City of Toronto (CoT) commercial facilities are expected to support and integrate voice, data and video communications with common media (fiber optic and unshielded twisted pair copper cable).

## DOCUMENT INTENT AND LIFE CYCLE

The purpose of this standard is to define the general guidelines and standards for the design, specification, installation, testing, troubleshooting, documentation and handing over of the commercial facilities (owned, controlled, or leased) communications distribution and structured cabling systems. This standard follows published industry standards and best practices applicable to the commercial buildings of City of Toronto (CoT). The life cycle of this document version is from January to December every year from 2023. Always consult City of Toronto (CoT) Network Services (IT) Division for the latest version of this standard guide.

This document addresses commercial buildings communications distribution and structured cabling system design as it relates to:

- Design guide, topology and methodology
- Communications Media – fibreoptics and copper unshielded twisted pair (UTP)
- Pathway System – cable trays, conduits, etc.
- Products

- Execution (installation)
- Testing and Commissioning
- Handing over (final acceptance)

This document should serve as a guide for making standards compliant project specification which, in due course, will be reflected in a master tender specification document. In addition to specifications for a telecommunications project, plan drawings and schematic diagrams will also need to be produced by the designer. The drawings should conform to the guidelines contained in this document. This document is to be used in conjunction with the latest edition of BICSI TDMM.

Though every attempt is made to cover unforeseen issues, every building and project has its own issues, therefore IT - Network Services and Telecommunication Services should be included right at beginning of the project and the communications specifications must be reviewed and approved by these groups within the City of Toronto (CoT).

## TYPES OF CONSTRUCTION

Throughout this document, reference will be made to three types of construction as defined below: new, overbuild and basic construction. These definitions are applicable to the purposes of this document only. A new commercial building communications distribution and structured cabling system as well as the addition to and/or modification of existing cabling system is included in these construction projects. Tradeoffs between design standards and practicality will many times be dependent upon the type of construction. Different design approaches may be warranted for differing types of construction.

### A- NEW CONSTRUCTION

New construction is defined as construction that results in a new (or new portion of an existing) commercial buildings communications distribution and structured cabling systems. For the most part, new pathway will be constructed, and new cabling will be installed in the pathway.

### B- OVERBUILD CONSTRUCTION

Overbuild construction is defined as construction which may include demolition and/or abandonment of existing pathway and cabling, reuse of existing pathway for installation of new cabling and/or the addition of new pathway and/or cabling to existing pathway and/or cabling. Common terms referring to this type of construction include expansion, renovation, remodel, addition and retrofit, among others.

### C- BASIC CONSTRUCTION

Basic construction is defined as construction that includes reuse of existing distribution pathway for the installation of new cabling. Demolition of existing cabling may be involved as well. Basic construction is focused on the installation of new cabling with no (minor) modifications to the existing pathway system.

## CITY OF TORONTO AGREEMENT WITH BELL CANADA FOR COMMERCIAL FACILITIES

Effective January 10, 2010, the City of Toronto (CoT) has entered into a multiyear Voice and Data cabling agreement with Bell Canada. Bell Canada is to be used for all Data and Voice cabling for all owned and leased buildings of the City of Toronto.

A pricing table of services regarding this agreement having unit cost is available to share from CoT-IT with the permission to only authorized recipients.

Based on the agreement, current cabling vendor of record (VOR) shall be used. The cabling VOR shall be verified by CoT-IT Network Services at the time of proposed work or RFP.

Analog devices such as fax, POS (dialup), modems and other specialized monitoring lines are using Centrex. The voice cabling system for Centrex will be supplied and installed by Bell as part of an agreement between Bell and the City of Toronto. Bell will have ownership of the voice cabling system.

Please contact CoT-IT-Telecommunications Services, voice infrastructure group for more details.

## CITY OF TORONTO TENDER DRAWINGS

This standard guide should be read in conjunction with the City of Toronto (CoT) standard drawings. The drawings shall typically be produced by the consulting engineers / designers and shall consist of (if applicable to the project) the followings but not be limited to:

1. Title Page and Drawing Index
2. Symbols (legends) and Notes General
3. Campus / Building Layout – Fibreoptics Backbone Network Layout (if applicable)
4. Fibreoptics Patch Panel Port Assignment (if applicable)
5. Campus / Building Layout – Voice (copper) Backbone Network Layout (if applicable)

#### SERVICES NOT PROVIDED BY THE CITY OF TORONTO

- The voice system technology (Bell Centrex etc.) shall be supplied and installed by Bell Canada.
- Entrance Facility and demarcation point shall be outlined in the specific design drawings. Service providers shall terminate the incoming copper cables on BIX and BIX cross-connect between the ISP and the OSP cabling at the Entrance Facility.
- Service providers shall terminate the incoming fibre cables in either wall mount or rack mount fibre enclosures between the ISP and the OSP cabling at the Entrance Facility.
- Witnessing field cable testing at site is NOT CoT's responsibility. The Contractor shall submit the test results to Consultant for their review, validation, witnessing and comment. Consultant shall forward the test results to CoT-IT/Network Services for further review (only if approved by the Consultant after their review). If there is no Consultant on the project, the contractor/cabling installer shall submit the test results to CoT's IT/Network Services for their review.
- BOQs/BOMs, layouts, elevations, drawings and schematics shall be prepared/reviewed by the Consultant.

## MANDATORY DESIGNERS' QUALIFICATION REQUIREMENTS

- The standard is to be observed by the City of Toronto - IT Network Services Staff and Consultants involved with the design and implementation of structured cabling systems for data networks which include data networks, security networks, VoIP networks and any other networks that require a structured cabling system that is unified and connected to the City of Toronto network.
- The preparation and review of any network cabling system design, drawings and specification documents shall be conducted by a **Registered Communications Distribution Designer (RCDD)**. The credential holder shall be in good standing who have demonstrated knowledge in the design, integration and implementation of telecommunications and data communications transport systems and related infrastructure.
- All consultant design drawings and specification document shall be sealed / stamped by RCDD.
- All cabling is to be provided from the manufacturers noted with the following sections. Cabling provided by alternate manufacturers is not acceptable.

In addition, the RCDD shall have the following qualifications:

- The RCDD shall demonstrate a minimum of 5 years of experience in the design of commercial buildings communications distribution systems. Experience not directly related to the design and installation of commercial buildings communications distribution systems, such as sales and/or marketing, is not acceptable.
- The RCDD shall demonstrate that he/she has designed or has had personal design oversight of a minimum of five projects similar in size and construction cost to the current CoT project.
- The RCDD consultant must have verifiable design experience with products and solutions from **Belden**.

Before commencing any work for or on behalf of the City of Toronto, the RCDD shall provide a copy of their RCDD certificate showing up to date registration in accordance with the **Building Industry Consultant Services International (BICSI)** policies and guidelines.

## MANUFACTURERS

In addition to the standards listed below, the City of Toronto has selected **Belden** as a manufacturer of communications cabling infrastructure products for commercial buildings. The manufacturer is identified in the Product Section. The commercial building communications distribution designer is required to incorporate only this manufacturer into the design and to design a communications distribution structured cabling system that will be suitable for the use of products from the manufacturer.

## ANSI/TIA RELATIONSHIP DIAGRAM

*Relationships between ANSI/TIA Standard Documents*

## DESIGN AND REFERENCE STANDARDS

It is required that the designer be thoroughly familiar with the content and intent of these references, standards, and codes and that the designer be capable of applying the content and intent of these references, standards, and codes to all commercial communications system designs executed on behalf of the City of Toronto.

Listed in the table below are references, standards, and codes applicable to commercial communications systems design. If questions arise as to which reference, standard, or code should apply in a given situation, the more stringent shall prevail. As each of these documents is modified over time, the latest edition and addenda to each of these documents is considered to be definitive.

Standard	Title	Date

## CITY OF TORONTO - STRUCTURED CABLING SYSTEM - DESIGN CONSIDERATIONS

This section highlights design considerations of particular importance to City of Toronto (CoT). It also discusses different CoT construction arrangements (new, overbuild, or basic) for a particular project.

## CITY OF TORONTO - COMMERCIAL BUILDING CABLING TOPOLOGY

The figure below is an illustration of the City of Toronto commercial building cabling topology. Some of the cabling system such as CAT3/5e backbone, may or may not be applicable to the project.

*Elements of the City of Toronto Standard Topology for Commercial Facilities*

## DESIGN SUMMARY

- The network shall be a distributed star topology network.
- All horizontal copper cables shall connect to the TE/TR from the WAO and fibre backbone cable shall connect to the ER (Server Room) from the TR/TE. The CAT3/5e backbone cabling from the TR/TE to the ER, may or may not be applicable to all the CoT projects.
- The specified copper network cables for all commercial buildings shall be Belden.
- The horizontal copper cable shall be U/UTP Category 6/6A and shall be in accordance to this specification.
- Length of the patch cables from WAO to the end device shall be in compliance to the Ethernet and structured cabling applicable standards.

- The backbone copper multi-pair (minimum 25 pairs) cable shall be U/UTP Category 3/5e and shall be in accordance to this specification. The multipair backbone, may or may not be applicable to all the CoT projects.
- The containment system for the voice and data network shall be as per the specified material mentioned in this document, unless specified otherwise on the design drawings/project scope. The approved conduit system is EMT type, appropriately sized as per TIA-569 standard. The cable tray shall be basket wire mesh type, corrosion resistant, standard sized as per TIA-569.
- The horizontal copper cables shall be permanently terminated at the patch panel in the Telecommunications Enclosure (TE) on one end, to a work-area outlet on the other end located on the walls of a commercial building.
- Horizontal cables in the commercial buildings shall always be collated of two (2) cables per work area outlet (WAO) located on the wall/furniture of the closed office or a cubicle.
- Office cubicles shall contain 1 WAO with 4 ports (1 Voice/VoIP, 1 Data and 2 Blank ports).

- Closed offices shall contain 1 WAO with 4 ports (1 Voice/VoIP, 1 Data and 2 Blank ports), shall be provided to every 10m<sup>2</sup> (100ft<sup>2</sup>) of office space (i.e. if the office is 10m<sup>2</sup> then it shall have 1 WAO). If the office is larger than 10m<sup>2</sup> (100ft<sup>2</sup>), then 2 WAOs shall be provided (with 2 Data and 2 Blank ports for the 2<sup>nd</sup> WAO).
- Each group of horizontal cables shall be associated with a single 4-port, work-area outlet on the wall/furniture and a 4-port, snap-in faceplate in the Telecommunication Enclosure patch panel.
- Approval for additional ports per cubicle or office must be granted by CoT IT/Network Services Technical Representative before proceeding with this work.
- Containment pathways shall be designed and sized for a minimum of four (4) horizontal cables, unless otherwise mentioned differently in the design drawings.
- The Fibre Optic Backbone is defined as the fibre optic segments radiating out from the Network Core Closet to the Telecommunications Enclosure/Room.
- The fibre allocation within the fibre optic backbone cable is as follows:
  - 12 Core fibre backbone: Multimode (OM4) and/or Singlemode (OS2)
  - City of Toronto LAN — 4 fibre strands active (2 primary, 2 redundant and 8 reserved)
  - All fibre cables shall be terminated and tested bi-directionally to the appropriate wavelengths (850/1300nm | 1310/1550nm) using calibrated certified testing equipment
- All passive network components shall be from a single manufacturer (Belden).
- The term "free-issue" refers to equipment supplied by the City. All the Network Switching and Routing Equipment will be freely issued by the City. The network equipment will be configured, tested and installed by City of Toronto IT/Network Services group.

## DESIGN DETAILS OF HORIZONTAL CABLING SYSTEM (CABLING SUBSYSTEM – 1)

Horizontal cabling includes installation cable, telecommunications connector/jack/module at the work area outlet (WAO), and mechanical terminations at both ends. Patch cords are required at WAO and TR/TE. Horizontal cabling length limitation requirements as specified in the ANSI/TIA-568.0-E and ANSI/TIA-568.1-E standards apply unless otherwise specified in this Standard.

### TOPOLOGY

The horizontal cabling shall meet the star topology requirements of ANSI/TIA-568.0 and ANSI/TIA-568.1. Each telecommunication work area outlet (WAO)/connector/module shall be connected to the

horizontal cross-connect (HC) located at the TE/TR as shown in figure below. The horizontal installation cable shall be terminated on a jack/module (balanced twisted pair) at one or both ends.

*Horizontal Cabling Topology*

## LENGTH

The horizontal cable length extends from the termination of the media on a patch panel at the TE/TR to the telecommunications connector/jack/module at the work area outlet (WAO). For balanced twisted-pair cabling the max permanent link length in the office/administration areas shall be 90m (295ft).

The length of the cross-connect/inter-connect jumper or patch cord at the cross-connect facility, including TE/TR, shall not exceed 5m (16ft) in the office/admin work area and 5m (16ft) in the TE/TR.

## RECOGNIZED MEDIA

The recognized media, which shall be used individually or in combination, are:

- Minimum 4-pair 100 ohm balanced twisted-pair cabling, category 6 or higher
- 4-pair 100 ohm balanced twisted-pair cabling, category 6A (as per ANSI/TIA-568.2-D, preferred)

The Recognized media and associated connecting hardware, jumper, patch cord, equipment cord, and work area cord shall meet the requirements specified in this document.

## CHOOSING MEDIA

Cabling specified by this Standard is applicable to different requirements within the commercial premises. Depending upon the characteristics of the individual application, choices with respect to transmission media should be made. In making this choice, factors to be considered include:

- Environmental classifications;
- Mitigation such as separation, protection or isolation;

- Cabling performance enhancements in accordance with performance test requirements;
- Applications to be supported by the cabling system;
- Equipment vendor recommendations or specifications;
- Configuration of cabling components;

The recognized cable has individual characteristics that make it suitable for a myriad of applications such as voice, data, video, automation and building controls, security, fire alarm, HVAC and audio visual (AV).

### DESIGN DETAILS OF BACKBONE CABLING SYSTEM (CABLING SUBSYSTEM – 2 AND 3)

Backbone cabling is the portion of the commercial building telecommunications cabling system that provides interconnections between Entrance Facility (EF), Equipment Room/Server Room (ER) and Telecommunications Room/Enclosure (TR/TE). Primary and redundant, 12 strands in each cable shall run between the equipment room and the telecom room. Total of 2 x 12 strands shall run with diverse pathways between the equipment and telecom rooms. As such, the backbone cabling shall meet the requirements of ANSI/TIA-568.0, ANSI/TIA-568.2 and ANSI/TIA-568.3 for Cabling Subsystem 2 and Cabling Subsystem 3.

Backbone cabling consists of the multipair copper/fibre cable(s), intermediate and main cross-connect mechanical terminations and patch cords or jumpers used for backbone-to-backbone inter-connection. The cabling should be planned to accommodate future equipment needs, diverse user applications, ongoing maintenance, service changes and relocation.

#### TOPOLOGY

The backbone cabling shall meet the hierarchical star topology requirements of ANSI/TIA-568.0, unless otherwise specified by this Standard.

There shall be no more than two hierarchical levels of cross-connect in the backbone cabling. From the Horizontal Cross-Connect (HC) or Telecommunications Enclosure/Room (TE/TR), no more than one cross-connect shall be passed through to reach the Main Cross-Connect (MC) or Equipment Room (ER) depending on configuration. Therefore, connections between any two HCs shall pass through three or fewer cross-connect facilities.

NOTE – The topology required by this specification has been selected because of its acceptance and flexibility in meeting a variety of application requirements. The limitation to two levels of cross-connects is imposed to limit signal degradation for passive systems and to simplify moves, adds and changes. This limitation may not be suitable for facilities that have a large number of buildings or those that cover a large geographical area.

*Backbone Cabling Topology*

### COMMERCIAL FACILITIES

The incoming fibre cable from the service provider enters the building Entrance Facility (EF) and spliced to ISP fibre at EF if the distance from the EF to the ER exceeds 15m (50ft). The ISP service provider cable runs from EF and terminates at Equipment Room (ER).

The multipair copper cable (if applicable to the project) for centrex voice runs from the ER/TR/TE to EF.

### SMALL COMMERCIAL SITES

In small commercial buildings of City of Toronto, there is no ER. The TE/TR acts as an ER. The incoming fibre cable from the service providers enters the facility and spliced to ISP fibre if the distance from the facility entrance to the TE/TR exceeds 15m (50ft). The ISP service provider cable runs from entrance point and terminates at Telecom Enclosure (TE)/Telecom Room (TR)/Equipment Room (ER).

### LENGTH

The backbone cable length extends from the termination of the media at the EF (Entrance Facility) to an IC (Equipment Room) or HC (Telecommunications Enclosure/Room). To minimize cabling distances, it is often advantageous to locate the EF near the center of the premises. Cabling installations may be divided into areas, which can be supported by backbone cabling within the scope of this Standard.

Cabling length is dependent upon the application and upon the specific media chosen (see ANSI/TIA-568.0 and the specific application standard). The backbone length includes the backbone cable, patch cords and cross-connect/inter-connect jumpers.

The length of the cross-connect/interconnect jumpers and patch cords in the EF or IC should not exceed 20m (66ft). The length of the cord used to connect telecommunications equipment directly to the EF or IC should not exceed 30m (98ft). For backbone link length less than 150m (492ft), OM4 multimode fibreoptics cable shall be used. More than 150m (492ft), OS2 singlemode fibreoptics cable shall be used.

### BACKBONE RECOGNIZED MEDIA

Recognized cables with associated connecting hardware, jumpers, patch cords, and equipment cords shall meet the requirements specified in this document. The recognized media of backbone shall be:

- For Data, the fibre allocation within the fibre optic backbone cable is as follows:
  - 12 Core fibre backbone: Multimode (OM4) and/or Singlemode (OS2) as per backbone cable link length requirements mentioned above
- For Centrex Voice:
  - CAT3/5e multipair U/UTP cabling (if applicable), 25 pair (or higher pair count)

### CHOOSING MEDIA

Backbone cabling specified by this Standard is applicable to a wide range of different user requirements. Depending upon the characteristics of the individual application, choices with respect to transmission media have to be made. In making this choice, factors to be considered include:

- Link length [ $\leq 150\text{m}$  (492ft) is OM4 multimode,  $> 150\text{m}$  (492ft) is OS2 singlemode]
- Useful life of backbone cabling
- Site size, user population and environmental conditions

Each recognized cable has individual characteristics that make it useful in a variety of situations. A single cable type may not satisfy all user requirements. It is then necessary to use more than one media in the backbone cabling. In those instances, the different media shall support the same facility architecture.

## **CABLING DIRECTLY BETWEEN TELECOMMUNICATIONS ROOMS / TELECOMMUNICATIONS ENCLOSURES**

Cabling directly between HCs (Telecommunication Enclosures/Rooms) is not permitted. All backbone cabling must follow the star topology specified in ANSI/TIA-568.0 by connecting back to the IC (Equipment Room/Server Room).

## **DESIGN CONSIDERATIONS FOR SPACES, ENCLOSURES AND ROOMS**

### SPACES

- Spaces in commercial premises shall meet the requirements of ANSI/TIA-569-E.
- Spaces shall comply with local codes and regulations.

- Spaces should be designed to be compatible with the worst-case environment to which they will be exposed (see ANSI/TIA-568.0 and TIA/TSB-185 for information on environmental classifications).
- Temperature and humidity shall meet the requirements for Class 4 as per ANSI/TIA-569-E, unless stated otherwise.
- Perform additions and modifications to the existing Local Area Network as shown on the Contract Drawings.

#### DESIGN GUIDE OF EQUIPMENT ROOM / NETWORK / SERVER ROOM (ER)

- If designing ER, consult this standard as a reference guide for Equipment Room (ER). Follow architectural/engineering drawings and project specifications as a design guide.
- The ER shall be strategically located to minimize the size and length of the backbone, especially in multiple-backbone situations.
- The ER shall accommodate the delivery of large equipment.
- The doors and hallways shall be sized appropriately for the movement of large equipment.
- Elevator or hoist and loading docks shall be available for large equipment movement.
- The weight capacity of the floors must be rated for large equipment.
- Any potential difficulties in scheduling and use of access routes and facilities for moving large equipment during installation and future changes shall be considered.
- Present and future needs shall be considered in properly locating and designing the ER.
- The ER telecommunications infrastructure shall be sized as required and capable of supporting a broad range of telecommunications applications required by the building or campus.
- Infrastructure shall be present for a large volume of cable between main distribution equipment and server racks.
- The ER telecommunications infrastructure shall be capable of supporting existing telecommunications equipment and/or cabling.
- The length of electrical power feeds from the electrical service entrance to the ER shall be minimized to aid in an optimal bonding and grounding arrangement.
- Access Card Reader should be added to access ER. Refer to CoT CORP SEC Standard for ACR/Sys.

- The distance (no closer than 3m [10ft]) to potential EMI and RFI sources shall be considered. These include transformers, motors, generators, radio transmitters, induction heating devices, photocopier, arc welding equipment, etc.
- The ER shall not be located in any place that may be subject to:
  - Water infiltration
  - Steam infiltration
  - Humidity from nearby water or steam
  - Heat (e.g. direct sunlight)
  - Corrosive atmospheric or adverse environmental conditions
  - Locations below water level unless infiltration preventive measures are employed.
- The ER shall not be located in any space in or adjacent to:
  - Mechanical rooms
  - Washrooms
  - Custodial closets
  - Storage rooms
  - Loading docks
  - Any area that contains sources of excessive EMI, hydraulic equipment, heavy vibration, steam pipes, plumbing, and cleanouts
- The ER must provide space for all planned equipment and access to all equipment for maintenance, administration and growth.
- The ER must meet the space requirements specified by equipment providers. Space and layout requirements for different telecommunications applications (e.g. voice, data) must be taken into account.
- For voice and data, provide 0.07m<sup>2</sup> (0.75ft<sup>2</sup>) of ER space for every 10m<sup>2</sup> (100ft<sup>2</sup>) of usable work area space.
- The minimum ER size shall be based on the known number of work areas as shown on the table below and not on usable floor area:

Equipment outlets served	Minimum floor space m <sup>2</sup> (ft <sup>2</sup> )	Typical dimensions m (ft)
Up to 100	9 (100)	3 X 3 (10 X 10)
101 to 200	13.5 (150)	3 X 4.5 (10 X 15)
201 to 800	36 (400)	6 X 6 (20 X 20)
801 to 1600	72 (800)	6 X 12 (20 X 40)
1601 to 2400	108 (1200)	9 X 12 (30 X 40)

- The guidelines for other support equipment, such as power distribution, conditioner systems, and UPS up to 100kVA shall be permitted in the ER. UPS larger than 100kVA should be located in a separate room.
- The ER layout and floor plan shall comply with TIA-568, TIA-569 and BICSI TDMM latest edition.
- A minimum ER space of 3m (10ft) by 4.5m (15ft) shall be allocated.
- The ER shall include adequate space to support equipment changes with minimal disruption. Sizing shall include projected future as well as present requirements.
- Equipment not related to the support of the ER (e.g. piping, ductwork, pneumatic tubing, etc.) shall not be installed within, pass through, or enter the ER.

Typical equipment room layout

- The ER shall include space for environmental control equipment, power distribution/conditioners, and uninterruptible power supply (UPS) systems that may be installed.
- The ER shall be designed and comply with the City of Toronto (CoT) Security requirements.

- The ER shall include barriers to protect sensitive network equipment from dust including door seals and air filtration.
- The ER shall include equipment and systems (grounding straps) to protect sensitive network equipment from static electricity.
- The ER shall be designed to comply with local zoning requirements for earthquakes and other natural disasters.
- The ER shall be designed to comply with NFPA-75 and include a pre-action fire protection system and hand-held fire extinguishers.
- The ER shall be designed for flood prevention and include a minimum of one floor drain for every 100m<sup>2</sup> (1075.84ft<sup>2</sup>).
- The ER shall attenuate ambient room noise to acceptable Acoustic Noise level limits in accordance with applicable standards.
- There shall be no attachment of pull boxes or any type of panel/enclosure onto the surface of the Telecom Enclosure/Cabinet/Rack. It is strictly prohibited and shall not be allowed in any circumstances to have a box or enclosure attached/fixed on the surface of a Telecom Enclosure/Cabinet/Rack.

## DESIGN GUIDE OF TELECOMMUNICATIONS ROOM (TR)

- If designing TR, consult this standard as a reference guide for Telecommunications Room (TR). Follow architectural/engineering drawings and project specifications as a design guide.
- A properly designed TR includes an HC (FD) that provides a floor-serving distribution facility for horizontal cabling. This cross-connect is capable of providing horizontal cabling connections to floor-serving telecommunications equipment and backbone cables from other TRs|TEs|ERs|EFs.
- Access Card Reader should be added to access ER. Refer to CoT CORP SEC Standard for ACR/Sys.
- The TR should be provisioned to house telecommunications equipment. In some cases, it may be necessary to combine the building and floor-serving functions of the ER and TR in one room. Instances where the two may be combined include smaller buildings (i.e., less than 500 m<sup>2</sup> [5400 ft<sup>2</sup>]) and those with limited space for distribution facilities.
- There must be at least one TR per floor. Multiple rooms are required if the cable length between the HC (FD) and the telecommunications outlet location, including slack, exceeds 90m (295ft) or if the usable floor space to be served exceeds 929m<sup>2</sup> (10,000ft<sup>2</sup>). For TRs that serve areas with an office density of less than one work area per 9.3m<sup>2</sup> (100ft<sup>2</sup>) of usable floor space, a TR may serve larger areas, provided the horizontal cable length requirements are met.
- Figure below shows a typical layout of a full-size TR, suitable for a maximum of 480, 4 twisted-pair cable terminations. The drawing illustrates architectural, mechanical, electrical, and telecommunications requirements on a single plan view perspective for purposes of showing coordination issues. Actual design documents will typically separate requirements by discipline.

Typical telecommunications room layout

## ENTRANCE FACILITY REQUIREMENTS (EF) | SHARED LAN/NETWORK ROOMS

- If designing EF, follow architectural/engineering drawings and project specifications as a design guide.
- Where functions of an entrance facility (EF) are combined with functions of the ER in the same space, the ER may house equipment dedicated to the Access Provider (AP). Requirements specified by the AP must be considered.

- As per ANSI/TIA-569-E, in shared LAN/Network Rooms between CoT-IT and other Agency/Third Party, individual spaces should be segregated by means of partitions using full size lockable cabinets or collocate cabinets. In extreme conditions, partitions may be comprised of cages, architectural assemblies or wire mesh walls.
- Where access providers and service providers share space (shared LAN/Network Rooms), individual spaces should be segregated by means of partitions. Partitions may be comprised of wire mesh walls or architectural assemblies.
- If separate AP space is required, it shall be adjacent to the EF. The design may require a mesh partition or locked cabinet. Space size at least 1.2m x 1.83m (4ft x 6ft) should be allocated for each AP.

## WORK AREA OUTLET (WAO)

- The work area outlet (WAO) components extend from the telecommunications outlet/connector end of the horizontal cabling system to the work area equipment. The telecommunications outlet/connector shall meet the requirements of this Standard. To simplify relocations, consider a single style of outlet/connector for all work area outlets of the same media type.

## WORK AREA OUTLET (WAO) FOR OFFICE AREAS

- Provide one 4-ports, single-gang, work area outlet in each work area for termination of the horizontal CAT6/6A cables. Faceplate or decora module frame shall be from Belden.
- One 4-port, work-area outlet shall be associated with as many ports necessary (in groups of 2 or 4) on the snap-in faceplate installed in the patch panel of the Telecommunication Enclosure.
- In the majority of cases the 4-port, work-area outlet shall be installed within the cubical partitions. In some situations, the work-area outlet shall be installed directly on the wall in office areas.
- All UTP connectors in the office area shall be unshielded modular jacks and wired for a T586A wire-map.

## U/UTP PATCH CORD FOR WAO IN OFFICE AREAS

- Patch cords used in the WAO shall meet the requirements of ANSI/TIA-568.2. WAO cabling may vary in form depending on the application. When application-specific adaptations are needed at the WAO, it shall be external to the telecommunications outlet/connector.
- Supply two (2) 5-metres or less, CAT6/6A U/UTP patch cords for each work area outlet.
- The contractor is responsible for certifying that the supplied patch cords shall meet or exceed the requirements for U/UTP patch cords as described in the ANSI/TIA-568.0 standard.

## WORK AREA OUTLET (WAO) FOR WIRELESS ACCESS POINT (WAP)

- Provide one (1) 4-port, single-gang, work-area outlet, connectors and accessories for termination of the horizontal UTP cables (2 for each WAP) dedicated for Wireless Access Point (WAP). Where ever, it is possible to connect to the closest TR, additional and separate WAO may not be required.
- CAT6/6A modular jacks shall populate two (2) modules/jacks in a 4-port WAO for each WAP.
- Each 4-port, work-area outlet shall be associated with a 4-port, snap-in faceplate installed in the Telecommunication Enclosure patch panel.

- WAP Heatmaps are required for accurate location of WAOs. Sample heatmaps are in Appx-C.

### UTP PATCH CORD FOR TE/TR/ER

- Supply minimum of 0.5 metre (2ft) CAT6/6A U/UTP patch cord for each data/VoIP drop (jack/module) to patch at TE/TR/ER.

### DESIGN CONSIDERATION OF PATHWAYS AND CONTAINMENT SYSTEM

- Pathways in commercial premises shall meet the requirements of latest ANSI/TIA-569 standard.
- Pathways should be designed to be compatible with the worst-case environment to which they will be exposed (see ANSI/TIA-568.0 for information on environmental classifications).
- Pathways in commercial premises shall comply with local codes and regulations.

### DESIGN GUIDE OF CABLE TRAY SYSTEM

- All cable trays shall be either a ventilated trough, wire-mesh or ladder-rack type, pre-fabricated structure 300mm (12 inches) in width or greater.
- Ventilating trays shall be equipped with two side rails with a maximum height of 150mm (6 inches) and consisting of a light, rugged and tubular steel or aluminum construction.
- Should aluminum trays be specified (CoT approval is mandatory), the engineer is to ensure that, during the grounding or bonding aspects of the installation, the contractor uses tin plated or zinc coated ground connectors.

- Install the ventilated cable tray in the horizontal cable distribution system such as hallways and under floor.
- A cable ladder rack system is to be installed within the Equipment/Server Room (ER) and Telecom Rooms (TR). Refer to the project specifications/drawings or reference in this document for the type of ladder rack to be used in the horizontal cable distribution system and within the applicable ER/TR's. Spine type and improperly centre hung cable trays will not be accepted.
- All metal cable trays shall be bonded together to the TMGB/PBB or a TGB/SBB.
- All metal cable trays shall be coated to prevent rust or galvanic action.
- Accessories and fittings such as elbows and reducers shall be manufactured by the cable tray manufacturer.
- Install cable trays at least 300mm (12in) away from fluorescent luminaries and cross power cables at right angles.
- The minimum clearances for cable trays shall be in accordance with Canadian Electrical Code C22.1-09.
- Allow 300mm (12in) vertical clearance excluding the depth of cable trays, between cable trays installed in tiers.
- 300mm (12in) vertical clearance from the top of cable trays to all ceilings, heating ducts and heating equipment.
- 600mm (24in) horizontal clearance on one side of cable tray mounted adjacent to one another or to walls or other obstructions.
- All cable trays/ladders shall be labeled at regular intervals. The distance separating labels shall not exceed 15 metres (50ft).
- The design fill ratio of a cable tray is 25% to a maximum fill ratio of 50% as per ANSI/TIA-569 standard.

## DESIGN GUIDE OF CONDUIT SYSTEM

- All telecommunications cables shall be installed in home run EMT conduits originating from the outlet to the cable tray system, Telecommunications Enclosure, or Telecommunications Room. The use of J-hooks, brackets and other attachments are not preferred but acceptable. Only Velcro ties are allowed. Plastic cable ties are not allowed in any condition.

- The inside radius of a bend in a conduit shall be not less than six times the internal diameter when the conduit is less than 50mm (2in) in diameter and ten times the internal diameter when conduit is 50mm (2in) in diameter or larger.
- All zone conduits shall be identified and labeled at both ends and at regular intervals not to exceed 10 metres (32.8ft). Tags shall identify start and finish of conduit runs. Pull boxes shall be labeled on the exposed exterior.
- All conduits shall originate and be physically connected to the telecom backboards in the Equipment Room, Telecommunications Room, cable tray and pull box.
- All metallic parts of the cable distribution supporting system shall be bonded together mechanically inclusive of all transition points (i.e. cable tray and distribution conduit not mechanically connected) using a 6 AWG green jacketed stranded copper ground wire. The metallic components of the cable distribution system shall be bonded together at the ER and TRs and then bonded to their respective telecom ground busbars.
- All fittings, connectors and couplings shall be of the same material as the conduit used on site.
- All conduits/sleeves that enter the ER or any TR shall be fitted with an approved ground bushing with ground lug and bonded together mechanically (one continuous piece preferred). This shall be connected to the approved building ground by means of a No. 6 AWG to the grounding busbar.

- Cable fill capacities of conduit shall not be greater than 40%.
- All conduits entering or existing through the ceiling or walls of the ER or TR shall protrude into the room 25-50mm (1-2in).
- Riser sleeves in the Equipment Room/Server Room and Telecommunication Rooms shall protrude through the floor 50-75mm (2-3in) above finished floor (AFF).
- All conduit runs shall follow building grid lines and shall be concealed where possible.
- All conduits shall be EMT, reamed and bushed at both ends and bonded to the distribution system unless installed in areas deemed chemically hazardous in which cases PVC coated or Aluminum conduit shall be used. Approval from the City of Toronto is required in such instances.
- All conduit runs shall be a maximum of 30 meters (100ft) in length with a maximum of two 90 degree bends between pull points, unless otherwise specified.
- Conduits ending in the vicinity of a cable tray shall be terminated at a height of no less than 100mm (4in) and no more than 150mm (6in) from the top of the cable tray. Conduit runs shall not be punched through the side of the tray. Conduit ends shall be bonded to the cable tray.
- The use of LB, LL, LR, C and T type fittings are not permitted. Only LBs designed and manufactured for communications systems are allowed where applicable.
- Conduit fittings shall not be used in place of pull boxes or bends.

#### DESIGN GUIDE OF PULL BOX

- A pull box shall be placed in conduit runs where the sum of the bends exceeds 180 degrees, where the overall length of the conduit run is more than 30m (100ft), or if there is a reverse bend in the run.
- Pull boxes shall be constructed and sized in accordance with Canadian Electrical Code, TIA and BICSI standards of code gauge steel and shall have a rust resistant finish.
- In all instances pull boxes shall be placed in straight sections of conduit run and shall not be used in lieu of a bend. Corresponding ends of the conduit are to be aligned with each other. Conduit fittings shall not be used in place of pull boxes or bends.
- Conduit must enter the outlet boxes from the top or bottom.
- Pull boxes shall be installed at a reasonable height, in an exposed location and such that access for installation of cables is not prohibited. Pull boxes shall not be placed in a fixed false ceiling

space, unless immediately above a suitably marked and hinged access panel. Provide indicator decals on ceiling T-bar rail or ceiling tiles showing location of pull box or splice box.

- All conduits shall be installed in accordance with Canadian Electrical Code, Part 1 Section 12, applicable building codes and ANSI/TIA 569.
- The minimum size (inside diameter) for conduit running between the Equipment Room or a Telecommunications Room and the Telecommunications outlet at an outlet location is 25mm (1in).
- The maximum horizontal cable run distance shall not exceed 90 metres (295ft).
- The cable length from the mechanical termination in the TR and ER to the telecommunications outlet, where the horizontal distance exceeds 90m (295') provided additional rooms as required.
- Future requirements for additional cables to each outlet shall be considered.
- A pull cord shall be installed in all conduits.
- The telecommunications outlet conduit system shall be labeled green.
- Place pull boxes in readily accessible locations only.
- The use of LB, LL, LR, C and T type fittings are not permitted. Only LBs designed and manufactured for communications systems are allowed where applicable.
- There shall be no attachment of pull boxes or any type of panel/enclosure onto the surface of the Telecom Enclosure/Cabinet/Rack. It is strictly prohibited and shall not be allowed in any circumstances to have a box or enclosure attached/fixed on the surface of a Telecom Enclosure/Cabinet/Rack.

## DESIGN GUIDE OF TELECOMMUNICATIONS BONDING AND GROUNDING SYSTEM

In general, a telecommunications grounding system contains the following components:

- Primary Bonding Busbar (PBB) or Telecommunications Main Grounding Busbar (TMGB)
- Telecommunications Bonding Backbone (TBB)
- Secondary Bonding Busbar (SBB) or Telecommunications Grounding Busbar (TGB)
- Telecommunications Bonding Conductor (TBC)

- The Telecommunications Bonding Backbone (TBB) consists of green jacketed stranded copper conductors and insulated copper busbars. The system extends from the Building Grounding Electrode Conductor through the ER to the TR's, within the building. The construction of the TBB is a requirement of the latest version of the ANSI/TIA-607. This standard shall be used in the design, installation, management and administration of the TBB systems in CoT facilities.

TIA--607-Terminologies

- All metallic parts shall be bonded together mechanically and attached to the approved building ground in accordance with applicable CEC, TIA and CSA standards. In all cases, the CEC shall be met or exceeded.

- Bonding conductors shall be continuous and routed in the shortest possible straight-line path. Any bends placed in the conductor shall be sweeping bends.
- Aluminium wires, clamps or terminal connectors are not acceptable for grounding and bonding.
- The following general requirements shall apply when constructing the TBB system:
  - An insulated pre-drilled, electro tin plated copper busbar, minimum dimensions of 6mm thick x 100mm wide and variable in length, shall be installed on the wall of the ER/EF adjacent to the cable entrance conduits, 150mm from the corner of the ER/EF and 150mm AFF. This busbar is known as the Primary Bonding Busbar (PBB) or Telecommunications Main Grounding Busbar (TMGB) and shall be insulated from its support by a minimum of 50mm.
  - An insulated pre-drilled, electro tin plated copper busbar, minimum dimensions of 6mm thick x 50mm wide and variable in length shall be installed on the wall of each TR (formally known as a Telecom Closet - TC), adjacent to the cable entrance sleeves, 150mm from the corner of the TR and 300mm AFF. These busbars are known as the Secondary Bonding Busbar (SBB) or Telecommunications Grounding Busbars (TGBs) and shall be insulated from its support by a minimum of 50mm.
  - A green jacketed stranded copper ground wire sized to maintain a voltage drop of less than 40 Volts under maximum short time rating. This wire shall be sized no smaller than No. 6 AWG nor larger than a 3/0 and shall be installed from the service equipment ground (main building ground) to the PBB/TMGB in the ER/EF. This ground wire is known as the Telecommunications Bonding Conductor (TBC). The Telecommunications Bonding Conductor (TBC) may be secured to the surface of the building if not subject to physical and mechanical damage, or installed in non-ferrous conduit. If ferrous conduit, such as EMT is used, the conductors shall be bonded to each end of the conduit with a conductor minimum sized as a No. 6 AWG green jacketed stranded copper ground wire.
  - The TBC shall be connected to the Primary Bonding Busbar (PBB)/Telecommunications Main Grounding Busbar (TMGB). The connection to the PBB/TMGB shall be done using a 2-hole electro tin plated compression lug. All joints to the TBC shall be done using irreversible compression-type connectors, exothermic welding, or equivalent.
  - The Telecommunications Bonding Conductor (TBC) shall be connected to the service equipment ground (main building ground) by qualified personnel and in accordance with the CEC and ANSI/TIA-607.
  - A green jacketed stranded copper ground wire sized the same as the Bonding Conductor for Telecommunications, shall be installed from the farthest TR, through each TR to the

Bonding Conductor for Telecommunications located in the ER/EF. This ground wire is known as the Telecommunications Bonding Backbone (TBB). The TBB may be fastened to the underside of open cable tray or installed in non-ferrous conduit. If ferrous conduit, such as EMT is used, the conductors shall be bonded to each end of the conduit with a conductor sized as a No. 6 AWG minimum.

- The TBB in each TR shall be connected to the SBB/TGB. All joints to the grounding wires shall be done using irreversible compression-type connectors, exothermic welding, or equivalent. The connection to the SBB/TGB shall be done using 2-hole compression connectors.
- The PBB/TMGB in the ER/EF and the SBB/TGB in the TR/TE(s) shall be bonded to the closest electrical panel using a No. 6 AWG green jacketed stranded copper ground wire.
- The metallic components of the horizontal distribution supporting infrastructure (conduits, cable trays and ducts) shall be bonded to the telecommunications busbars of the ER/EF or TR/TE in which they originate using a No. 6 AWG green jacketed stranded copper ground wire.
- A No. 6 AWG green-jacketed stranded copper ground wire shall be installed from each telecommunications busbar to the metal frame (structural steel) of buildings that are effectively grounded and whose structural steel is accessible.

## SEPARATIONS FROM EMI

- Copper cables shall not be installed at a distance less than 300mm from lighting ballasts, less than 1 meter from electric motors or at a separation distance from source of 480V or less.
- Where electric power cable is not installed in EMT conduit, telecommunications cable shall not be run in parallel with it for more than 10 meters if the separation is less than 300mm.
- Electrical protection must be provided for copper cables entering the building. Protection shall be in accordance with the Canadian Electrical Code CSA C22.1-2006 and BICSI practices.

## DESIGN GUIDE OF TAGGING CONVENTION (IDENTIFICATION AND LABELING)

- The requirements of this section shall take precedence over other sections.
- The labeling of the City of Toronto network components, structured cabling and cable routing/containment shall comply with the ANSI/TIA-606 standard

- The codification of network components, cables and cable routing shall follow the identification standards detailed in this standard.

- For example:

- Building Location: YDE – 30 Dee Ave

- Floor and Room Location: ER – Equipment Room / Server Room / Main Communications Room

TRA – Telecom Room - A

TRB – Telecom Room – B

EF - Entrance Facility

- Service Provider / Network Cabinet Label in ER: COT-IT-YDE-0100

Network Closet

- Network Cabinet Label in ER: COT-IT-YDE-0200

Network Closet

- Server Cabinet Label in ER: COT-IT-YDE-0300

Server Closet

- Patch Panel: A – Data Patch Panel A (A,B,C, etc ...)

FP01 – Fibre Optic Patch Panel

TP01 – Telephone/Voice Patch Panel

- Patch Panel Port: 01 – Patch Panel Port (01, 02, 03, ..., 24)

- Work Area Number: 125 – Work Area number associated in the admin/office areas of the facility

- Work Area Outlet: WA01 – Work area outlet (01, 02, 03, etc...)

1 – Port number (1, 2, 3, 4)

## EQUIPMENT / NETWORK / SERVER ROOM CABINETS IDENTIFICATION AND LABELING

- Equipment Room/Server Room network enclosure contains active network components, including: Network Core Closet, Server Closet and Telecommunications Enclosure.
- All Network Closets/Cabinets related to the Equipment Room (ER) shall be tagged as follows.

- COT-IT-XYZ-XX00, where:
  - XYZ = Site three-character code name
  - XX00 = First two numbers (XX) identify the closet
- For all closets/enclosures/cabinets in the Equipment Room, the last two numbers are always zero (00).
- For Closets/Cabinets in the Equipment Room, they are numbered from (0100) to (1000).
- Network Core Closet and Server Closet nameplate shall conform as follows:
  - Provide nameplate for each enclosure on the bottom-center of the door, front and back.
  - Use engraved gravoply laminate nameplates using black letters on a white background.
  - The laminate nameplates shall have a dimension of 210mm W x 50mm H.
  - Minimum character height shall be 12mm. Character lettering shall be centered on each line.
  - Mount nameplates with two stainless steel machine screws.
  - Include device identification (tag) number as well as a descriptive name.
  - For example: the tag name: COT-IT-XYZ-0100 followed by the description: Sample nameplate diagram is as below:

COT-IT-YDE-0100  
NETWORK CLOSET  
(Lamacoid label on  
the cabinet shall be  
at the bottom. IT  
will provide lamacoid  
spec standard )

**COPPER PATCH PANEL (CP) & WORK AREA OUTLET (WA) IDENTIFICATION AND LABELING**

- The copper data patch panels in a Telecommunications Enclosure/Closet shall employ one character A, B, C, ..., Z. The rack shall be populated with patch panel(s) as necessary and labeled in sequential order from top to bottom.
- For example, the first copper data patch panel from the top of the rack shall be labeled A, the second shall be B, and so on.
- Each 24-port patch panel shall have six (6) snap-in faceplates that group four terminations. For office areas, the minimum number of ports associated with a work area outlet shall be a group of two (2) ports.
- Labels shall be applied to patch panels in such a manner as to be readily visible and not obscured by structured cabling or patch cords.

- Labels for each 4-port or 2-port, snap-in faceplate shall be laser printed, self-laminating, adhesive, polyester or polyolefin. Hand-written labels shall not be accepted.
- Lettering shall be black on a white background. Characters are a minimum of 4mm high.
- Apply a label on the top of each group of 4-ports or 2-ports on the snap-in faceplate to indicate the destination of the cables terminated on the data ports (RJ).
- For office areas, the label 125-WA01 would be applied on the patch panel for a group of 2 ports with destination cables to work area outlet 125-WA01. Whereas, 125 represents the room number of the facility and WA01 represents the work area 01.

- Apply a two-digit label immediately above each data port (RJ) indicating its destination port number on the work area outlet. For example, a group of four consecutive ports on a 24-port patch panel whose destination is port numbers 1 to 4 on a WAO would have the ports labeled 1, 2, 3, 4. Provide color-coded, snap-in icons for each data port (RJ).

## FIBREOPTICS PATCH PANEL (FPP) IDENTIFICATION AND LABELING

- Lettering shall be black on a white background. Characters are a minimum of 4mm high.
- Terminate all 12 fibres of each fibre optic cable in Fibre Enclosures (Telecommunications Enclosure or Network Core Closet).
- The fibre cable for all even-numbered Telecommunications Enclosures shall terminate at Network Core Closet 02 (XYZ-0200) while odd-numbered shall terminate at Network Core Closet 01 (XYZ-0100).
  - For cases where Network Core Closet 01 and Network Core Closet 02 are located in different Equipment Rooms, Telecommunications Rooms / Telecommunications Enclosures shall have fibre terminating in both Network Core Closets.
- The ordering and color of individual fibres shall be the same for each fibre cable and compliant with the latest ANSI/TIA-568.3 and ANSI/TIA-598 standards.
- Labels for patch panels shall be laser printed, self-laminating, adhesive, polyester or polyolefin. Hand-written labels shall not be accepted.
- Labels shall be applied to patch panels in such a manner as to be readily visible and not obscured by structured cabling or patch cords.
- A label shall be applied to the top of the LC duplex adapter modules associated with a single fibre cable indicating the destination of the cable.
- For example, the adapter modules that terminate the fibre cable whose destination is Telecommunications Enclosure 1400 would be labeled as XYZ-1400.
- The fibre patch panel label shall be labeled as follows FPXX where XX is the fibre patch panel sequence i.e. 01, 02, 03...etc. The rack shall be populated with patch panels as necessary and labeled in sequential order from top to bottom.
- For example, the first patch panel from the top of the rack would be labeled as FP01, the second is FP02 and so on.

## WORK AREA OUTLET (WAO) IDENTIFICATION AND LABELING

- Labels for each 4-port, work area outlet shall be laser printed, self-laminating, adhesive, polyester or polyolefin. Hand-written labels shall not be accepted.
- Lettering shall be black on a white background. Characters shall be a minimum of 4mm high.
- A label shall be applied to the top of each 4-port, work-area outlet indicating the source of the Horizontal cables.
- For example, WAO port 1 connected to patch panel A port 1 would be labelled as A01. WAO port 2 to patch panel A port 2 is labelled A02 and so on.

## CABLE IDENTIFICATION AND LABELING

- Use durable non-fading sleeve type wire markers to identify all network cables.
- Labels for cabling shall be laser printed, self-laminating, adhesive, polyester (indoor/outdoor). Hand-written labels will not be accepted.
- Lettering shall be black on a white background. Characters shall be a minimum of 4mm in height.

## FIBREOPTICS BACKBONE CABLE IDENTIFICATION AND LABELING

- As a minimum, all fibre optic backbone cables shall be labeled at both ends of the cable, within every pull box and every 15 metres.
- In addition, the fibre backbone cables shall be labeled at each transition. A transition is defined as: a change in ducting (e.g. cable tray to conduit), a change in direction of more than 45 degrees, or an entrance and exit of ducting through a wall or floor.
- If the fibre cable is run in conduit then the transition labels shall be applied to the conduit.
- The tagging convention for identification of fibre optic backbone cables shall indicate the source and destination of the cable separated by a colon.
- For example, a fibre optic backbone cable whose source is Network Core Closet 2 (XYZ-0200), Fibre Patch Panel 01, adapter panel A and terminates in Telecommunications Enclosure 1400 (XYZ-1400) on the fibre patch panel 01 adapter panel A would have the following tag: 0200-FP01-A.01: 1400-FP01-A.01. The last "01" digits represent fibre strands.
- The Telecommunications Enclosure fibre optic patch panel must be labeled. For example: Telecommunication Enclosure 1400 with two fibre optic patch panels would be labeled "FP01" and "FP02", where "FP01" is the first patch panel from the top.

## HORIZONTAL COPPER CABLE IDENTIFICATION AND LABELING

- As a minimum, all horizontal CAT6/CAT6A cables shall be labeled at both ends of the cable, within every pull box and every 15 metres.
- In addition, the cables shall be labeled at each transition. A transition is defined as: a change in ducting (e.g. cable tray to conduit), a change in direction of more than 45 degrees, or an entrance and exit of ducting through a wall or floor.
- If the cable is run in conduit then the transition labels shall be applied to the conduit.
- The tagging convention for identification of Horizontal cables shall indicate the source and destination of the cable separated by a colon.
- Example 1: a horizontal cable whose source is Telecommunications Enclosure TRB-4, Patch Panel A, port 01 and whose destination is port 1, Work-Area Outlet 01, in room number 125 would have the following tag: YDE-TRB-4-A01:125-WA01-1.

## VOICE BACKBONE COPPER CABLE IDENTIFICATION AND LABELING

- As a minimum, all voice backbone cables shall be labeled at both ends of the cable, within every pull box and every 15 metres.
- In addition, the voice backbone cables shall be labeled at each transition. A transition is defined as - a change in ducting (e.g. cable tray to conduit), a change in direction of more than 45 degrees, or an entrance and exit of ducting through a wall or floor.
- If the voice cable is run in conduit then the transition labels shall be applied to the conduit.
- The tagging convention for identification of voice cables between the voice block and the Telecom Closet/Enclosure patch panel in the building shall be VFFA-CC : XYZ-A-TP01 (indicate the source and destination of the cable separated by a colon), where V indicates voice, FF indicates the floor number, EF indicates telecommunications entrance facility ID, CC indicates 2-digit voice cable ID, CC indicates 2-digit voice cable number, and XYZ-A is telecommunications closet/enclosure ID.
  - For example, voice cable 01 whose source is entrance room EF and terminates in Telecommunications Room B (YDE-TRB) on patch panel TP01 would have the following tag: V01EF-01 : YDE-TRB-TP01.

## PATCH CORD IDENTIFICATION AND LABELING

- As a minimum, all Contractor installed CAT6/CAT6A or fibre optic patch cords shall be labeled at both ends of the cable.
- The tagging convention for identification of patch cords shall indicate the source and destination of the cable separated by a colon. The source is the switch port and the destination is the patch panel, termination point.

## CABLE PATHWAYS IDENTIFICATION AND LABELING

- All ducting (cable tray or conduit) carrying fibre optic and multi-pair voice backbone cables shall be tagged as "LAN BACKBONE".
- All ducting (cable tray or conduit) carrying Horizontal cables shall be tagged as "LAN HORIZONTAL" with the source and destination network panels.
- All ducting shall be labeled at each transition. A transition is defined as - a change in ducting (e.g. cable tray to conduit), a change in direction of more than 45 degrees, or an entrance and exit of ducting through a wall or floor.
- Use engraved gravoply laminate nameplates using black letters on white background.
- The laminate nameplates shall have a dimension of 210mm W x 50mm H.
- Minimum character height shall be 12mm. Character lettering shall be centered on each line.

## FIRE STOPPING

- Fire stop systems in commercial premises shall meet the requirements of latest ANSI/TIA-569.
- Fire stop systems should be designed to be compatible with the worst-case environment to which they will be exposed (refer to ANSI/TIA-568.0 for information on environmental classifications).
- Provide EZ PATH solution where conduit penetrates fire rated walls, floors, partitions and ceilings to ensure that the fire rating is maintained. Abandoned penetrations shall be properly fire stopped. Provide EZ PATH system.
- The required fire rating is minimum 2 hours.

## SUBMITTALS

- Comply with the requirements of Section 01300 - Submittals.
- Shop Drawings shall be submitted to the City of Toronto IT staff for final review before proceeding with any works.

- The shop drawings and all submissions shall be reviewed and sealed by the RCDD Contractor's PM and re-reviewed and sealed by the Consultant's RCDD before reaching the City for final review.
- Final design drawings/construction drawings shall be submitted to the City of Toronto IT staff for final review and before proceeding with any works. These drawings shall be reviewed by PM RCDD Contractor and re-reviewed and approved by RCDD Consultant before reaching to the City for final review.
- The CADD drawings shall meet the City's CADD standards. Any non-compliance shall be at the Consultants own expense.
- Submit proposed cable and enclosure tag labels to the Contract Administrator and the City of Toronto IT Technical Representative for approval before proceeding with this work.
- Submit red-lined Site Drawings identifying the proposed location of all enclosures including Telecommunication Enclosures, Termination Panels and Work Area Outlets prior to installation and as part of shop drawing submittals.
- Submit site drawings identify the fibre optic backbone cable routes and horizontal cabling routes to be used prior to installation and as part of the shop drawing submittals.
- Prior to x-raying and coring access holes submit red-lined Site Drawings showing the proposed location of the holes.
- Submit red-lined annotated working Drawings to the Contract Administrator, to clearly document the as-built network including details related to: location (closets, work area outlets), cabling (size, length, type, routing), tagging (cable ducting, cabling, closets and work area outlets).
- Submit all submissions in both a hardcopy and electronic native format. Handwritten submissions are not acceptable. Also, submit electronic files in a PDF digital format that is indexed and searchable.
- Submit the following documentation prior to starting the site acceptance test:
  - City of Toronto IT/Network Services — Cable Test Results
  - Operations and Maintenance Manual of any and all electronic equipment to or is installed.
  - Revise and annotate Contract Drawings, to clearly document the as-built network including details related to: location (closets, terminations panels) cabling (size, length,

type, routing), tagging (cable ducting, cabling, closets and termination panels) final as built drawings, cabling schematics, pathways and conduits drawings (containment system), any other documents, reports and drawings needed by the City of Toronto during or after work is completed.

- Consultants shall review and approve all submissions prior to final review by the City.
- Consultant is responsible to submit the final as-built drawings of the project / facility to the City.

END OF SECTION

## SECTION -2: PRODUCTS

Products and part numbers often change without notice. The Consultant shall verify all parts specified and used are current and available.

Consultant shall practice the procedure of shop drawings / products approval as stated in this section. Shop drawings shall be submitted by the Contractor to the Consultant. The Consultant / Designer shall review and approve the shop drawings submittal before sending it to the City of Toronto IT for final review. After receiving the submittal from the City IT, the Consultant / Designer shall send the final approval or approval with comments / notes to the Contractor.

### APPROVED MANUFACTURERS

- All backbone fibreoptic cables, connectors, patch cords, patch panels, cassettes and adaptors shall be from Belden.
- All CAT6/CAT6A modular jacks, faceplates, U/UTP patch cords and Category 6/6A cables shall be from Belden.
- Where cross connect punch down is required at Entrance Facility for termination of all voice backbone cables, it shall be from Belden.
  - [www.belden.com](http://www.belden.com)
- All wall mount Telecommunication Enclosures shall be from Hammond Manufacturing.
  - [www.hammondmfg.com](http://www.hammondmfg.com)
- All free standing Paramount Telecommunication Enclosures in the Equipment Room / Telecom Room shall be from Chatsworth Products.
  - [www.chatsworth.com](http://www.chatsworth.com)
- All fire-stopping EZ-PATH components shall be from Specified Technologies Inc.
  - [www.stifirestop.com](http://www.stifirestop.com)
- For UPS and Power Distribution Unit, Liebert - Emerson and APC shall be the manufacturers.
  - [www.emersonnetworkpower.com](http://www.emersonnetworkpower.com) ; [www.apc.com](http://www.apc.com)
- Manufacturer Substitution of any part other than those specified in this standard is strictly prohibited without the written consent of the City of Toronto Information Technology (IT) Network Services Division.

## ENTRANCE FACILITY PROTECTION

- Indoor voltage protector to protect entrance terminal to provide voltage and current protection and a disconnect facility at building entry points.
- Integral, 28 AWG (0.32 mm), non-replaceable fuse link wire between the incoming pairs and the protector modules.
- 25-pair connector for single-pair terminations (one pair "IN", one pair "OUT"), compatible with 22 to 26 AWG.
- The protected entrance terminal shall comply with CSA specification C22.2, No. 226-92, "Protectors in Telecommunication Networks," including the high-voltage fault test.
- Protectors to be included with supplied assembly.
- Consultant to use Belden data sheet to specify correct part number for the application.

## FIRE RATED BACKBOARD PLYWOOD

- In the Entrance Facility, Equipment Room and Telecom Room Fire Rated plywood shall be provided on the walls or struts such that there is proper cable penetration from behind.
- Plywood shall be void-free and either fire-rated or treated on all sides with at least two coats of fire-retardant light-colored paint.
- Have at least two walls lined with A/C grade or better, 2.4 m (8 ft) high with a minimum thickness of 19 mm (3/4 in). To reduce warping, plywood should be kiln-dried to maximum moisture content of 15 percent. Mount plywood 200 mm (8 in) AFF to avoid damaging the plywood. Have the plywood with the grade A surface exposed. The plywood should be securely fastened to wall-framing members to ensure that it can support attached equipment.
- All joints screw and nail holes are to be caulked and / or covered.
- The plywood is to be provided for cross-connect fields, security panels, power supplies etc. as may be required and is not intended for cabinet installation.

## NETWORK CABINETS (CORE AND SERVER CLOSETS)

- 44U Floor Standing Cabinets
  - Cabinets shall be supplied and installed complete with all accessories to provide a complete cabinet as indicated below.

- Cabinets shall be floor mounted, freestanding and have the ability to be ganged together.
- Cabinets shall have a capacity of 44U with mounting holes as per EIA-310-E.
- Each server cabinet shall be black with square hole rails.
- Each network / service provider cabinet shall be black with round hole rails.
- Specified Product:
  - W762mm X D1067mm X H2133mm Cabinet
  - Front Door
  - Rear Split Door
  - Solid Side Panels
  - Rackmount rails (square for server and round for network cabinets)
  - Top Panel
  - 483 mm (19") Mounts with cage nuts
  - 10-32 Cage nuts and screws (square for server and round for network cabinets)
- Electrical
  - Contractor is to provide the electrical distribution for each IT Network and Server cabinet as per the related Electrical Distribution drawings and relevant City standards.
  - Bond each 19" cabinet to ground.
  - Provide each Core and Server cabinet with two (2) 20A, 120 VAC, receptacles for UPS circuits. Terminate each UPS circuit at a 3-wire, duplex receptacle mounted to the rail of the 19" cabinet.
  - The duplex receptacles shall be mounted in such a manner as not to interfere with access to or removal of other equipment within the enclosures.
  - Power distribution within the enclosure shall be via vertically mounted metered power bars.
  - Redundant power supplies, within the same device, shall not be connected to the same UPS circuit.

- Power Distribution Unit (PDU – Power Bar)
  - The Liebert MPH rack PDU shall be managed three-phase power distribution unit that shall be monitoring along with receptacle control.
  - Liebert MPH units shall be available for mounting in either vertical, zero-U configuration and rack-mounting in standard, network enclosures.
  - The output receptacles support equipment requiring connection with NEMA 5-20R and IEC60320-C13 plugs.
  - Remote monitoring shall be enabled by the included communication card, the Liebert RPC™, which permits managing the Liebert MPH over a secure Web page and SNMP-based network management system.
  - The Liebert RPC shall permit interconnecting multiple Liebert MPH and / or Liebert MPX units for monitoring and management.
  - A Liebert MPH shall be monitored locally with an RPC BDM™, an optional display module that connects directly to the communication card. The display module can be handheld, mounted in or on the rack or mounted on a nearby wall.
  - Multiple Liebert MPHs can be centrally managed with Liebert Nform™, which adds group-based receptacle management.

## TELECOMMUNICATIONS ENCLOSURE (TE)

- Unless otherwise specified all indoor enclosures containing network components are to be NEMA 12.
- A lockable double hinged door allows front and rear access to rack-mounted components.
- All screws, bolts, fasteners etc. shall be corrosion resistant stainless steel.
- All wall-mounted panels shall be separated from the wall by stainless steel spacers or galvanized steel struts.
- Doors shall have continuous hinges with removable pin and oil resistance cellular neoprene gasket secured by gasket retainers. Front door handles shall be recessed type (freestanding enclosures) or 3-point external latch (wall mount), complete with key locks.
- Provide locking mechanism for rear door. All key locks shall be identically keyed.
- Key number shall be provided.

- Cable bundles shall be neatly laced, run in ducting or approved cable managers and secured to 19" cabinet or mounting back-panel.
- All enclosure doors shall open through 180 degrees without restriction from front and the back.
- Enclosure layout and equipment spacing shall be constructed to allow for device removal, calibration and maintenance without disassembly of adjacent devices.
- All enclosures shall have sufficient structural reinforcements to ensure a limited plane surface vibration and to provide rigidity during shipment, installation and operation without distortion or damage to the enclosure, mounting panel or mounted instruments.
- All enclosure seams shall be continuously welded and ground smooth to be undetectable after painting.
- Devices shall be installed on the enclosure back-panel or 19" cabinet only.
- There shall be no devices installed on the side plates of the enclosure.
- Conduit accessibility shall be per manufacturer's guidelines with conduit egress through the bottom and sides but not the top of the enclosure.
- There are three sizes of TE, 12U, 19U and 26U. All provided by Hammond Manufacturing.
- Minimum items in the TE shall include but are not limited to one fibre termination panel (1U), three 24 port (1U) patch panels (1 x Telephone and 2 x Data), two (2) 24 ports or one (1) 48 ports Cisco switch, two (2) 2U Horizontal Cable Manager, one (1) 1U monitored PDU and other optional equipment as may be requested by CoT-IT such as UPS or other equipment.
- All TEs shall be bonded to the Telecommunications Bonding System as per the standard.
- The bonding cable shall be sized according to distance and terminated at the nearest Telecommunications Grounding Busbar and run within conduit.
- The TE shall be CSA approved and sealed.
- Provide the enclosure electrical distribution as per the Telecommunication Enclosure (Typical) - Electrical Distribution drawing.
  - The Telecommunication Enclosure shall be powered by two separate 15 A, 120 VAC supplies (Utility and Network). The Utility Supply is to power non-critical components (enclosure lighting and power bar). The Network Supply (UPS) is to power the critical network components (Ethernet Switch) and environmental controls (ventilating fans).

Contractor shall provide the Utility Supply from the nearest lighting panel as per the TE Installation drawings. The Network Supply is to be provided by others. Where applicable, the Contractor shall provide a 15A Supplementary DIN rail mounted breaker for termination of the Network Supply. In addition, the Contractor shall provide a knockout for the Network Supply conduit as per the Access Closet Installation drawings. All power distribution installation shall be mounted to the top rear side of the TE.

- Provide 120 VAC, 3-wire, duplex receptacles, circuit breakers, surge suppressor, wire duct and grounding bar per the Telecommunication Enclosure Layout drawing and associated Component Schedule. The Contractor shall provide rigid-steel conduit and wiring to provide the 15 A, 120 VAC Utility Supply as per the Access Closet Installation drawings. The Utility Supply shall be terminated at a 15 A, DIN rail mounted, circuit breaker and surge suppressor. Distribution of the Utility Supply is as documented in the Telecommunications Enclosure – Electrical Distribution drawing.
- All power distribution installation shall be mounted to the top rear side of the TE.
- A rack mount UPS shall be supplied that will power the Telecommunication Enclosure Network Supply. The Contractor shall be responsible for the distribution of the Network Supply within the TE and for providing a 15 A supplemental breaker for termination of the supply by others.
- Power Distribution Unit (PDU - APC)
  - The APC rack mount PDU/transfer switch shall be managed three-phase power distribution unit that monitoring along with receptacle control.
  - The APC units shall be available for rack-mounting in standard, network enclosures.
  - The output receptacles support equipment requiring connections (10) with NEMA 5-15R.
  - Remote monitoring shall be enabled with a secure Web page and SNMP-based network management system.
  - The APC PDU shall permit interconnecting multiple units for monitoring and management.

#### WORK AREA OUTLETS FOR OFFICE AREA

- All modular jacks, faceplates and furniture inserts shall be Belden and performance rated to Category 6/6A.

- Provide one 4-port, single-gang, work area outlet in each work area for termination of the horizontal CAT6/6A cables with faceplates or decora module frames.
- For new construction, it is recommended that the outlet boxes be 100mm X 100mm X 54mm deep, complete with a mud ring cover specifically designed for single gang faceplates intended for flush mounting to the wall. This single gang outlet box aids in the maintaining of Category 6/6A and higher bend radius requirements.
- Where walls are not suitable or have insufficient depth, standard electrical size outlet boxes shall be used.
- Each manager's office shall have two (2) work area outlets on separate walls.
- One (1) 4-port, work-area outlet shall be associated with as many ports necessary (in groups of 4 or 2) on the snap-in faceplate installed in the patch panel of the TE or TR as is provided.
- Within each office outlet, only two of the ports shall be terminated at the work area faceplate and patch panel unless otherwise specified.
- Space shall be left in each conduit and faceplate for a third and fourth cable to be added at a later time.
- In the majority of cases one (1) 4-port, work-area outlet shall be installed within each systems furniture cubical work area partition.
- In some special situations where the systems furniture is configured fully the work-area outlet shall be installed directly on the wall in the office areas.
- Within systems furniture, only two of the four positions shall be terminated with work area jacks and on the patch panels unless otherwise specified.
- Space shall be left in conduits and faceplates for the inclusion of a third and fourth cable at a later time.
- In boardrooms and large general office areas, one single gang work area outlet shall be provided every 3.0 metres and within 1.0 metres of an electrical outlet if provided.
- Only two of the four positions shall be terminated with work area jacks and on the patch panels unless otherwise specified.

## FACEPLATES

- Faceplates shall be modular Belden white format opening to allow the possibility of changing connector types in the future without replacing the entire unit.
- Faceplates shall be equipped with small form factor terminating connectors to fit the individual outlet's requirements
- Faceplates shall be equipped with a minimum of four (4) openings for modules. Contractors are to equip the faceplate with the required number of blank inserts as required.

## WORKSTATION FACEPLATES AND ADAPTERS - CUBICLES

- Workstation outlets shall be supplied and installed for all terminations at the workstation end and as further specified below to suit the application.
- Each workstation shall be equipped with minimum two (2) RJ45 Cat6/6A green color jacks.
- The Communications Consultant shall confirm the color of outlets prior to placing order.
- Modular Furniture Faceplates
  - Modular furniture faceplates shall be installed in all furniture outlets that have a modular furniture knockout shall consist of 4 ports.
  - Each outlet shall be installed with the specified termination modules or a blank insert. No openings shall remain exposed.
  - Communications Consultant shall verify furniture modular faceplate requirement.
  - Belden MDVO modular furniture adapter, 4 port, white
  - Belden MDVO modular furniture adapter, 4 port, black
- Surface Mount Boxes
  - Surface mount boxes shall be installed for all furniture outlets that do not have a modular furniture knockout, exposed ceiling outlets or any location not provided with an electrical back box.
  - The surface mounted box shall consist of a minimum of two (2) ports.
  - Each outlet shall be installed with the specified termination modules or a blank insert. No openings are to remain exposed.

- Belden MDVO side entry box, white
- Belden MDVO side entry box, black

#### RJ45 CAT6/6A JACKS

- Belden Eight-position modular jack (RJ45), type Category 6/6A to TIA-568 shall be green color and shall have the following minimum performance characteristics:
  - Modular jack current rating: 1.5 Amperes maximum
  - Modular jack durability 1,000 mating cycles
  - Modular jack contact Pressure: 100 grams minimum per contact
  - Dielectric voltage strength: 1,000 V RMS at 60Hz for 1 minute
  - Insulation resistance: 200 milli-ohms minimum
  - Contact resistance 1 milli-ohms per contact
- The contact material of the jack in a modular jack connector shall be phosphor bronze with 50 micro-inches of gold over nickel.
- UTP termination modules shall be of the same category as the UTP cabling to ensure that manufacturer end to end warranties can be attained.
- UTP cables used for IP voice shall be terminated with the same specified jacks.
- All UTP termination modules shall be Belden MDVO type.
- Belden CAT6/6A modular jack, MDVO style, green color.
- Belden ID data tab, MDVO style, green color.

#### COPPER PATCH PANEL (CPP)

- All horizontal CAT6/6A U/UTP cabling shall be terminated on 1U, 24 ports, Belden CAT6/6A modular patch panel.
- All copper patch panels shall be black.
- All modular patch panels shall be populated with CAT6/6A UTP modules/jacks as required.
- The modular copper patch panel shall mount to standard TIA 482.6 mm (19") rack.

- Contractor to refer to installation instructions provided with the patch panel for proper installation.

#### COPPER CAT6/6A HORIZONTAL CABLE (U/UTP)

- Belden, four-pair, 100 ohm balanced unshielded-twisted-pair (U/UTP) cable, appropriate flame test classification, Category 6/6A (CAT 6/6A) shall be in compliance to TIA-568 standard.
- All cables fully contained within conduit or areas that are not plenum rated shall use CMR/FT4 rated cable.
- Any cable, regardless of length passing through a return air plenum ceiling and not in conduit shall be rated CMP/FT6.
- All UTP cables shall meet requirements identified below:
  - Color: Blue
  - Rating: CMR/FT4 (riser rated or in conduit) or CMP/FT6 (plenum areas or in J-hooks)
  - Category: 6/6A
  - 23 AWG, spool-in-a-box
- All CAT6/6A horizontal cables shall be eligible for the Belden 25 years Certification Warranty.
- Cabling shall be installed and terminated as per the BICSI Installation Methods Manual, Belden Certification training and the manufacturers' installation instructions.

#### COPPER CAT6/6A PATCH CORD (U/UTP)

- Patch cord shall be manufactured of stranded conductor cable with 8-position, 4-pair terminations at both ends.
- All patch cords shall be manufactured by Belden and performance rated to CAT 6/6A.
- All patch cords shall be of the same or higher performance category and manufacturer of the U/UTP horizontal cabling system that shall be warranted as part of the end-to-end solution.
- All patch cords shall be standard compliant and minimum of FT4 or LSZH rated.
- All patch cords shall be manufactured and certified, 4-pair stranded conductors copper cables, field assembled patch cords are not allowed.

- All patch cords shall be gray in color.
- The Contractor shall supply patch cords in the following length:
  - At patch panel location, provide 0.5 metres long patch cords for all terminated horizontal cables unless otherwise advised by Consultant or CoT-IT.
  - At workstation or work area outlet location, provide patch cords of suitable length and not longer than 5 metres (typically 2.1 metres but Project Consultant to finalize) for every terminated horizontal cable unless otherwise advised by Consultant or CoT-IT.
- Patch cords shall be installed and terminated into the final device by the Contractor as per the BICSI Installation Methods Manual, Belden Certification training and the manufacturer's installation instructions.

#### BACKBONE CABLE FOR VOICE CENTREX ONLY - ISP (CAT3/5E)

- Category 3/5e rated wire and cable placed in the inside environment shall be solid, 24 AWG, twisted pair and multi-conductor.
- All cables fully contained within conduit or areas that are not plenum rated shall use CMR rated cable.
- Any cable, regardless of length passing through a return air plenum ceiling and not in conduit shall be rated CMP.
  - Belden: CMR: min 25 pairs | CMP: min 25 pairs

#### TELEPHONE PATCH PANEL FOR VOICE (TPP)

- Minimum 1U 24 RJ45 UTP ports.
- Accommodates 180, 110, or 90 degree patch cord connectors on back of patch panel.
- Does or doesn't require the use of a punch-down tool and mounts to standard EIA 19" rack.
- Belden for voice unloaded patch panel - black
- Belden jacks for voice unloaded patch panel, white – CAT3/5e
- Belden ID voice tab for unloaded patch panel, white

**VOICE CROSS CONNECT AT ENTRANCE FACILITY (EF)**

- Voice cross-connect is a system that consists of various sizes of BIX blocks, cable distribution accessories (such as moulded rings and strips) and a BIX tool to terminate wires at the BIX block. The voice cross-connect system is primarily composed of two parts: the mount and the connectors.
- Cross-connect mount is a wall-mounted frame, generally built from 16-gauge steel. The frame features a rectangular plastic backplate and two plastic brackets that extend from either side of the backplate to fit between two and ten connectors. The connectors shall be oriented horizontally on the mount.
- The connectors are rectangular punch-down blocks used to terminate up to 25 pairs. The connectors shall have a slip-in fitting which automatically strips the wire as it is punched down, eliminating the need for pre-stripping. The connectors shall also have a pair-splitter to facilitate fast arranging of wires on the punch-down block.
- Backbone cables shall be terminated on the backboard (as shown on drawings) unless otherwise specified in this document.
- All cables shall be terminated on IDC connectors complete with associated hardware such as mounts, cable / cross-connect wire managers, etc.
- The IDC connectors shall accept 24 to 26 AWG solid copper conductors.
- The IDC mounts shall accept cables from behind the connector.
- Cross-connect shall be a 5-pair block and include appropriate mounting and number of designation strips and labels.
- Cable management in the form of distribution rings or approved similar shall be provided between columns and rows of IDC mounts to support cross connect management in a manner recommended by the manufacturer.
- Instruction sheets for products are available from Belden.
- Belden 50 pair BIX mount
- Belden BIX distribution connector – 5 pair marking
- Belden accessories such as jumper wires, labels etc. to complete the system.

## FIBROPTIC CABLES

### INDOOR BACKBONE MULTIMODE OM4 FIBROPTIC CABLE

- The cable is performance rated to OM4 and shall be used only if the backbone link length is less than or equal to 150 meters.
- Primary and redundant, 12 strands in each cable shall run between the equipment room and the telecom room. Total of 2 x 12 strands shall run with diverse pathways between the equipment and telecom rooms.
- All cables shall be fully contained within conduit or areas that are not plenum rated shall use OFNR/FT4 rated cable.
- Any cable, regardless of length passing through a return air plenum ceiling and not in conduit or using cable tray / J-hook shall be rated OFNP/FT6.
- Fiber cables shall be protected when entering the patch panel with a black color flexible conduit.
- Core-locked, tight-buffered, black, indoor/outdoor fiber-express distribution cables.
- 50/125-micron core/cladding, laser optimized.
- 4700 MHz-km bandwidth at 850nm wavelength (EMB).
- 3500 MHz-km bandwidth at 1300nm wavelength.
- Only cables from Belden shall be accepted.
- All fibreoptics cables shall be installed and terminated into fibre optic adapters contained in fibre optic patch panels by the Contractor as per the BICSI Installation Methods Manual, Belden certification training and installation instructions.
- Belden:
  - OFNR/FT4
  - OFNP/FT6

### FIBROPTICS PATCH PANEL (FPP)

- Fibreoptics cabling shall be terminated in patch panels intended for fibre optic cable management.

- Belden Fiberoptics Rack Mount Enclosure for Telecommunication Enclosures shall be:
  - 3U - 19" Rack Mount Enclosure
  - Durable black powder coat finish
  - Be equipped with cable strain relief and slack storage
- Belden Blank Fibre Adapter Panel shall be:
  - Blank Fibre Adapter Panel to fit Fibre Adapter Patch Panel
  - Durable black powder coat finish
- Belden Fiberoptics LC Fibre Adapter Strip shall be:
  - Loaded with TIA-604 FOCIS-10 compatible adapters, TIA-568.3 standard compliant
  - Split sleeve: Zirconia Ceramic
  - Adapter housing colors follow TIA-568.3 suggested color identification scheme.
  - Belden part number for 6 LC duplex adapter strip
- Belden 1U fibre cover, smoked plexiglas
- Belden Splice Case / Modules / Trays for OM4 Cable Terminations shall be:
  - Belden splice tray for 3U rack mount fibre enclosure

#### FIBEROPTICS LC CONNECTOR FOR FIELD TERMINATION OF OM4 CABLE

- Optical fibre terminations for OM4 cable shall be made for field termination with a pre-polished connector and shall be of the same manufacturer and LC style to suit the cabling installed.
- Fibre connectors shall match the performance of the fiberoptics cable (OM4).
- Fibre terminations shall be made with a ceramic ferrule and cable boot.
- Optical fibre cables shall be terminated with pre-polished connectors having the characteristics as below:
  - Return loss: >20dB (multimode)
  - Termination Style: Pre-Polished

- Connector Type: LC
  - Ferrule Type Zirconia Ceramic
- The connector shall include connector body / ferrule assemblies, crimp sleeves, dust caps, clip, and appropriate boot.
- All Fiberoptics connector terminations and adapters shall be contained in fibre optic patch panels from Belden by the Contractor as per the BICSI Installation Methods Manual, Belden certification training and installation instructions

#### FIBEROPTICS LC PIGTAIL FOR FIELD TERMINATION OF OM4 CABLE

- Optical fibre OM4 cable shall be fusion spliced to pig-tails for field termination and shall be of the same manufacturer and LC style to suit the cabling installed.
- Pigtail shall be OFNR (FT4) or LSZH rated and stamped/printed accordingly.
- The pigtail shall be 100% factory terminated and inspected end face geometry in compliance with Telcordia GR-326-CORE, issue 3.
- Typical insertion loss per pigtail connection: 0.25dB.
- Field assembled pigtails are not allowed.
- The Contractor shall supply and fusion splice every strand of the fibre backbone cable with a pigtail. The pigtail length shall be 1m.
- Belden OM4 pigtail
- Belden fusion splice heat shrink protector sleeves

#### FIBEROPTICS MULTIMODE LC-LC DUPLEX PATCH CORDS – OM4

- All patch cords shall be CSA/TIA/UL approved, CMR (FT4) or LSZH rated and printed accordingly.
- All optical fibre patch cords shall be OM4.
- All optical fibre patch cords shall be manufactured and certified, 1-pair (duplex, 2 strands). Field assembled patch cord is not allowed.
- The Contractor shall supply a minimum two (2) patch cords for every OM4 backbone cable:

- At patch panel in the telecom room (TE), provide one (1) 2-meter-long patch cord unless otherwise specified by CoT IT.
- At patch panel location in the equipment room (ER), entrance facility (EF), or any other space provide one (1) 2-meter-long patch cord unless otherwise specified by CoT IT.
- All optical fibre patch cords shall be LC to LC duplex.

### PATHWAY SYSTEM – CONDUIT AND CABLE TRAY

- Cable tray shall be used above ceilings in commercial facilities and below raised floor systems as may be found in equipment rooms or data centers.
- All pathway (conduit and cable tray) systems shall be designed in accordance with the latest version of the ANSI/TIA-569-E Standard which exceeds the minimum requirements of Canadian Electrical Code. Pathway systems that are designed only to the Canadian Electrical Code and do not include all requirements of the ANSI/TIA-569-E standard will be considered substandard and removed until such time as they are in compliance.
- Consultant to confirm with both the facility and CoT-IT regarding the areas that are suitable for Electrical Metallic Tubing (EMT).

### ELECTRICAL METALLIC TUBING CONDUIT - EMT

- To be used within the office areas only (if applicable).
- Electrical Metallic Tubing shall be electro-galvanized steel.

### FITTINGS

- Fittings for electrical metallic tubing shall be single screw indenter fittings for conduits up to 2" and double screw indenter fittings for conduits 2" and larger.
- Die-cast or pressure cast fittings are not permitted.
- Connectors shall have insulated throat up to and including 1" size. For sizes 1-1/4" and larger, provide plastic insulating bushing.
- Provide conduit body types, shapes and sizes as required to suit application and NEC requirements. Provide matching gasket covers secured with corrosion-resistant screws.

## EXPANSION FITTINGS

- Provide expansion fittings with external grounding straps at building expansion joints.
- Minimum 4" movement in either direction.
- At expansion joints in concrete pours, provide deflection/expansion fittings capable of movement of  $\frac{3}{4}$ " in all directions from the normal.

## WATER PROOFING SEALS

- Provide watertight expanding link-type seals for installation between the conduit and the sleeve or core drilled hole.

## WIRE BASKET TRAY

- The wire basket tray shall be 12 – 13 gauge, straight sections shall be powder coated black with an average paint thickness of 1.2 mils (30 microns) to 3.0 mils (75 microns).
- Tray shall be designed in such a way as to be secured to the following, but not limited to: wall, ceiling every 1.2 metres.
- Splicing trays shall be accomplished by using a single manufacturer supplied UL classified connector bolt or splice plate.
- Depth: Tray depth shall be (unless otherwise shown on the drawings) 100mm (4 inches).
- Width: Tray width shall be (unless otherwise shown on the drawings) 300mm (12 inches).
- Turning Fences shall maintain approved bend radius and be constructed from sheet steel and plated in accordance with applicable standards.
- Intersections shall be made from high strength steel, welded and plated in accordance with applicable standards.
- Proper manufactured accessories and fittings such as elbows, reduces, crossovers, tees and riser shall be used for any change in direction, height or size of the cable basket tray.
- Support cable tray to suit loading and recommended support requirements in the Canadian Electrical Code Part II.
- Materials bolted or riveted to the cable tray shall be free of burrs and or sharp edges.

## VENTILATED CABLE TRAYS

- All cable tray systems shall be designed in accordance with the latest version of the ANSI/TIA-569-E Standard and BICSI TDMM which exceed the minimum requirements of Canadian Electrical Code. Cable tray systems that are designed only to the Canadian Electrical Code and do not include all requirements of the ANSI/TIA-569-E Standard and BICSI TDMM shall be considered substandard and removed until such time as they are in compliance.
- Consultant to confirm with both the facility and CoT-IT regarding the areas that are suitable for cable tray, if suitable, what material type given the impact of certain airborne chemicals (aka Chlorine) that corrode metals.
- The ventilated cable tray is preferred to be used for horizontal cable distribution.
- The ventilated cable tray shall include but not be limited to the following characteristics:
  - A prefabricated structure consisting of a ventilated bottom with integral longitudinal side rails with no openings exceeding 50mm or 2" in a longitudinal direction.
  - Shall be prefabricated from a pre-punched sheet to produce a one-piece ventilated tray.
  - Shall be available in Aluminum, pre-galvanized Steel, hot dip Galvanized Steel and Stainless Steel 316.
  - Shall be a minimum of 103mm or 4" in depth or as appropriately designed and approved by Project Consultant and CoT-IT.
  - Proper manufactured accessories and fittings such as elbows, reduces, crossovers, tees and riser shall be used for any change in direction, height or size of the cable tray.
  - Spine type cable tray is not acceptable.
  - Support cable tray to suit loading and recommended support requirements in the Canadian Electrical Code Part II.
  - The support shall be placed within a maximum of 610mm on either side of any connection to a fitting.
  - Materials bolted or riveted to the cable tray shall be free of burrs and or sharp edges.

## JUNCTION BOX

- All junction box applications shall be designed in accordance with the latest version of the ANSI/TIA-569-E Standard and BICSI TDMM which exceed the minimum requirements of Canadian Electrical Code. Application of junction boxes that are only designed to the Canadian Electrical Code and do not include all requirements of the ANSI/TIA-569-E Standard and BICSI TDMM shall be considered substandard and removed until such time as they are in compliance.
- Consultant to confirm with both the facility and CoT-IT regarding the areas that are suitable for junction box construction type given the impact of certain airborne chemicals (aka Chlorine) that corrode metals.
- For standard non chemically hazardous environments junction boxes shall be constructed of not less than 14-gauge galvanized steel with trim for flush or surface mounting in accordance with the location to be installed.
- Provide screw-on type cover boxes installed in damp or wet locations shall be of rain-tight construction with gasketed cover and threaded conduit hubs.
- Boxes shall be NEMA approved for the environmental condition of the location where they will be installed.

## POKE THROUGH FLOOR BOX

- Where office facilities exist but access for cable distribution from above is not possible it may be practical to serve the floor from the ceiling space below with a Poke Through.
- Aluminum modular fire rated poke-through floor boxes coverings.
- Installs in 4" (101.6mm) diameter core drilled hole through concrete.
- UL listed for use in 1-4 hour rated floors.
- Poke-through fitting and universal cover combination exceed UL514A scrub water exclusion requirements.
- Stationary fire barrier expands during fire conditions to provide upper fire seal with adjustable fire barrier that would accommodate concrete floor thickness from 2-1/4" to 7".
- Dual 1" E.M.T. conduit tubes feed from communications feed and one for the electrical (when needed).
- Furniture feed for both power and communication services to modular furniture systems.

- Poke-through to have dual panels, one to hold four (4) RJ45 CAT6/6A Data/Voice ports. The other panel will have a blank plate.
- One-piece dual style line Poke-Through aluminum finish.
- Aluminum modular fire rated poke-through floor boxes coverings.
- Installs in 4" (101.6mm) diameter core drilled hole through concrete.
- UL listed for use in 1-4 hour rated floors.
- Poke-through fitting and universal cover combination exceed UL514A scrub water exclusion requirements.
- Stationary fire barrier expands during fire conditions to provide upper fire seal with adjustable fire barrier that would accommodate concrete floor thickness from 2-1/4" to 7".

#### GROUNDING AND BONDING

- All bonding to ground systems shall be designed and installed in accordance with the latest version of the ANSI/TIA-607-D Standard and BICSI TDMM which exceed the minimum requirements of the Canadian Electrical Code. Grounding and Bonding for Communications that are designed only to the Canadian Electrical Code and do not include all requirements of the ANSI/TIA-607-D Standard and BICSI TDMM shall be considered substandard and removed until such time as they are in compliance.
- Consultant to confirm with both the facility and CoT-IT regarding the areas that are suitable bonding and grounding points given the impact of certain airborne chemicals (aka Chlorine) that corrode metals.

#### PRIMARY BONDING BUSBAR (PBB) / TELECOMMUNICATIONS MAIN GROUNDING BUSBAR (TMGB)

- An insulated predrilled copper busbar listed by NRTL, electro-tin plated with holes 8mm diameter for use with standard-sized lugs.
- Dimensions 6mm thick, 100mm wide, variable length as applicable.
- Shall be insulated from its support by a minimum of 50mm.

## SECONDARY BONDING BUSBAR (SBB) / TELECOMMUNICATIONS GROUNDING BUSBAR (TGB)

- Predrilled copper busbar listed by NRTL, electro tin plated with holes 8mm diameter for use with standard-sized lugs.
- Dimensions 6mm thick, 50mm wide, variable length as applicable.
- Shall be insulated from its support by a minimum of 50mm.

## TELECOMMUNICATIONS BONDING BACKBONE (TBB)

- Cable assemblies shall be UL Listed and CSA Certified and be a minimum of 6 AWG copper conductor, green insulated.
- Telecommunications Grounding and Bonding Conductor Label Kits shall be supplied and installed by the Electrical Contractor at every rack and cabinet as well as one for every Telecommunications Grounding Busbar.
- The bonding conductor size shall be as follows:

TBB Length in Linear metres Metres (feet)	TBB Size (AWG)
Less than 4 (13)	6
4-6 (14 – 20)	4
6-8 (21 – 26)	3
8 – 10 (34 – 41)	2
13 – 16 (42 – 52)	1/0
16 – 20 (53 – 66)	2/0
Greater than 20 (66)	3/0

**TELECOMMUNICATIONS BONDING CONDUCTOR (TBC)**

- Cable assemblies shall be UL Listed and CSA Certified and be a minimum, the same size as the largest TBB copper conductor.
- Shall be green insulated and marked in accordance with ANSI/TIA-607-D.

**WARNING LABELS**

- Non-metallic warning labels in English: TIA-607-D.
- Identify labels with wording "If this connector is loose, please call the building telecommunications manager or site / area supervisor".

**FIRE-STOPPING**

- A fire-stop system is comprised of the item or items penetrating the fire rated structure, the opening in the structure and the materials and assembly of the materials used to seal the penetrated structure. Firestop systems comprise an effective block for fire, smoke, heat, vapor and pressurized water stream.
- All penetrations through fire-rated building structures (walls and floors) shall be sealed with an appropriate fire-stop system (EZ-PATH). This requirement applies to through penetrations (complete penetration) and membrane penetrations (through one side of a hollow fire rated structure). Any penetrating item i.e., riser slots and sleeves, cables, conduit, cable tray, and raceways, etc. shall be properly fire-stopped with EZ-PATH.
- Firestop systems shall be UL Classified to ASTM E814 (UL 1479) and shall be approved by a qualified Professional Engineer (PE), licensed (actual or reciprocal) in the state where the work is to be performed. A drawing showing the proposed fire-stop system, stamped/embossed by the Professional Engineer of Ontario (P.Eng.), shall be provided to the Owner's Technical Representative prior to installing the fire-stop system(s).
- EZ-PATH Part Numbers:
  - EZ-PATH Series 22, 33 and 44 (size based on cable quantities).

**END OF SECTION**

## SECTION – 3: EXECUTION

It is Consultant / Designer responsibility to check the latest version of this document from CoT-IT.

### GENERAL

- RCDD certified engineer shall perform the design and consulting work.
- Contractors / Technicians shall be certified with Belden and Fluke Networks to perform installations and testing / commissioning.
- Contractors must have an RCDD installation Team Lead / Project Manager.
- Technicians who have not completed the appropriate certification or training shall not pull, terminate or otherwise be involved in the installation of the telecommunications physical infrastructure with the exception of bonding to ground.
- Installers performing the testing (SAT, Acceptance, Commissioning, etc.) shall be Certified Cabling Test Technician on Fluke DSX / Versiv and Optifibre OTDR equipment.
- Following are the procedures to follow for successful project handing over:
  - Cable Acceptance Testing (CAT) – See Appendix for correct Sample Test Results and Compliance Sheet
  - Site Acceptance Testing (SAT) - See Appendix for Sample SAT Documents
  - As-built Drawings and Documents (ADD)
  - Consultant Review and Comments (CRC)
  - CoT-IT Approval of Satisfaction (AoS) – Signing off

### HORIZONTAL CABLE INSTALLATION

- All cables and components shall be installed as per the Belden's instruction sheets, ANSI/TIA standards and the BICSI Installation Methods Manual to complete the project.
- All testing of the Category 6/6A cabling system shall be with Fluke DSX-5000 / 8000 Versiv Cable Analyzers.

## FIBREOPTIC CABLE INSTALLATION

- All cables and components shall be installed as per Belden's instruction sheets, ANSI/TIA standards and the BICSI Installation Methods Manual to complete the project.
- All testing of the fibre optic installation shall be with test equipment from Fluke DSX-5000 / 8000 Versiv and if required (upon CoT-IT request) Optifibre OTDR.

## CABLE ACCEPTANCE TESTING

- This section specifies the acceptance testing requirements for backbone fibre optic as well as horizontal UTP cabling.
- Supply all of the test equipment required to conduct acceptance tests.
- Submit acceptance documentation as defined in this section.
- All of the installed cabling must be tested and successfully pass all test criteria.
- Standards referenced in this section include:
  - ANSI/TIA-568: Telecommunications Cabling Standard. All standards referenced within the TIA-568, where applicable, constitute standard provisions of this specification.
  - ANSI/TIA-526-14: Optical Power Loss Measurement, Multimode
  - ANSI/TIA-526-7: Optical Power Loss Measurement, Single-mode
  - ANSI/TIA-1152: Requirements for field test instruments and measurements for balanced twisted-pair cabling
- Visually inspect all cables, cable reels and shipping cartons to detect possible cable damage incurred during shipping and transport. Visibly damaged goods shall be returned to the supplier and replaced at no additional cost to the City.
- All cables and termination hardware shall be 100% tested for defects in installation and to verify cabling system performance under installed conditions according to the requirements of ANSI/TIA-568 standard. All pairs of each installed cable shall be verified prior to system acceptance. Any defect in the cabling system installation including but not limited to cable, connectors, feed through couplers, patch panels and connector blocks shall be repaired or replaced in order to ensure 100% useable conductors in all cables installed without cost to the City.

## COPPER PERMANENT LINK TESTING – HORIZONTAL CABLING

- All unshielded twisted-pair copper cable links shall be tested for continuity, pair reversals, shorts, opens and performance to Category 6/6A. Horizontal cabling shall be tested using a minimum level IIIe test unit for Category 6/6A performance compliance.
- Continuity - Each pair of installed cable shall be tested using a test unit that shows opens, shorts, polarity and pair-reversals, crossed pairs and split pairs. The test shall be recorded as pass/fail as indicated by the test unit and referenced to the appropriate cable identification number and circuit or pair number. Any faults in the wiring shall be corrected and the cable re-tested prior to final acceptance.
- Length - Each installed cable link shall be tested for installed length using a TDR type device. The cables shall be tested from patch panel to patch panel, block to block, patch panel to outlet or block to outlet as appropriate. The cable length shall conform to the maximum distances set forth in the ANSI/TIA-568.2 standard. Cable length shall be recorded, referencing the cable identification number and circuit or pair number. For multi-pair cable, the shortest pair length shall be recorded as the length for the cable.
- Horizontal twisted pair cable shall meet or exceed the permanent link, performance requirements specified in ANSI/TIA-568.2 for Category 6/6A, Unshielded Twisted Pair (U/UTP).
- All tests shall be conducted using permanent link configuration on the testing equipment.

## COPPER TEST EQUIPMENT

- Category 6/6A Test Equipment - Category 6/6A test equipment shall meet the following minimum criteria:
  - All test equipment of a given type shall be from the same manufacturer and have compatible electronic results output. Acceptable test equipment manufacturer is Fluke Networks. Unless the manufacturer specifies a more frequent calibration cycle, calibration date shall be not more than a year from cable test date. Recommended test equipment is a Fluke Networks DSX 5000 / 8000 Versiv Cable Analyzer.
  - Test adapters must be approved by the manufacturer of the test equipment. Adapters from other sources are not acceptable. For horizontal cabling, permanent link adapters shall be used.
  - Baseline accuracy of the test equipment must meet or exceed TIA Level IIIe, as indicated by independent laboratory testing.

- Test equipment must be capable of certifying Category 6/6A to TIA-568.2 standard.
- Test equipment must have a dynamic range of at least 100 dB to minimize measurement uncertainty.
- Test equipment must be capable of storing full frequency sweep data for all tests.
- Test equipment must include S-Band time domain diagnostics for NEXT and return loss (TDNXT and TDRL) for accurate and efficient troubleshooting.
- Test equipment must be capable of running individual NEXT, return loss, etc., measurements in addition to auto tests. Individual tests increase productivity when diagnosing faults.
- Test equipment must make swept frequency measurements in compliance with ANSI/TIA-568.2 standard.
- The measurement reference plane of the test equipment shall start immediately at the output of the test equipment interface connector. There shall not be a time domain dead zone of any distance that excludes any part of the link from the measurement.
- The calibration of equipment shall be valid within one (1) year of the test date.

#### ■ Permanent Link in LAN

## ■ Permanent Link Test in DC

Data center two connector permanent link definition:

### HORIZONTAL CABLE TESTING DOCUMENTATION - COPPER

- Category 6/6A (UTP) Documentation - As a minimum, test reports shall include the following information for each U/UTP CAT6/6A cabling element tested:
  - Wiremap results that indicate the cabling has no shorts, opens, split, reversed, or crossed pairs and end-to-end connectivity is achieved.
  - Attenuation, NEXT, PSNEXT, Return Loss, ELFEXT and PSELFEXT data that indicate the worst-case result, the frequency at which it occurs, the limit at that point and the margin. These tests shall be performed in a swept frequency manner from 1 MHz to highest relevant frequency, using a swept frequency interval that is consistent with TIA and ISO requirements. Information shall be provided for all pairs or pair combinations and in both directions when required by the appropriate standards.
  - Length (in meters), propagation delay and delay skew relative to the limit.
  - Any individual test that fails the relevant performance specification shall be marked as a FAIL.

- Cable manufacturer, cable model number/type and NVP.
- Tester, manufacturer, model, serial number, hardware version and software version.
- Circuit ID number (Cable Tag Id) and Facility name.
- Test criteria used.
- Overall pass/fail indication.
- Date and time of test.

## BACKBONE FIBREOPTIC TESTING

- Backbone fibre optic cable shall meet or exceed the permanent link, performance requirements specified in ANSI/TIA-568.3 for multimode and singlemode fibre.
- Test link attenuation with an OLTS:
  - For multimode fibre, make reference measurements in accordance with TIA-526-14, Annex A – One cord reference method. Measure optical loss on each fibre at 850nm and 1300nm. It is required to measure loss on each fibre from each direction (bi-directional).
  - For singlemode fibre, make reference measurements in accordance with TIA-526-7, one cord reference method. Measure optical loss on each fibre at 1310nm and 1550nm. It is required to measure loss on each fibre from each direction (bi-directional).
- Measure link length optically or calculate using cable sheath length markings.
- Multimode backbone fibre optic cabling shall meet the following loss and length criteria:
  - Attenuation @ 850nm shall be less than or equal to: fibre length (km) x 3.0 dB/km + number connector pairs x 0.5 dB + number of splices x 0.3 dB.
  - Attenuation @ 1300nm shall be less than or equal to: fibre length (km) x 1.5 dB/km + number connector pairs x 0.5 dB + number of splices x 0.3 dB.
  - Length shall be less than or equal to 150 meters.
- VCSEL driver is preferred to be used for testing as the SFP active modules on the switch runs with VCSEL drivers up to 10Gbps.
- Singlemode backbone fibre optic cabling shall meet the following loss and length criteria:

- Attenuation @ 1310nm shall be less than or equal to: fibre length (km) x 0.4 dB/km + number connector pairs x 0.75 dB + number of splices x 0.3 dB.
- Attenuation @ 1550nm shall be less than or equal to: fibre length (km) x 0.4 dB/km + number connector pairs x 0.75 dB + number of splices x 0.3 dB.
- Length more than 150 metres and shall be less than or equal to 10000 meters.

## BACKBONE FIBREOPTICS TESTING DOCUMENTATION

- Fibreoptics Documentation: As a minimum, test reports shall include the following information for each fibreoptics cabling element (fibre) tested:
  - Actual measured attenuation, maximum allowable attenuation (loss) and the attenuation margin at the specified wavelengths. An individual test that fails the link criteria shall be marked as FAIL.
  - Reference method.
  - Number of mated connectors.
  - Actual length and maximum allowable length. Any individual test that fails the link length criteria shall be marked as FAIL.
  - Group refractive index (GRI) for the type of fibre tested, if length was optically measured.
  - Tester manufacturer, model, serial number and software version.
  - Circuit ID number (Cable Tag ID) and facility name.
  - Link criteria used.
  - Overall pass/fail indication.
  - Date and time of test.

## FIBREOPTIC TEST EQUIPMENT

- All test equipment of a given type shall be from the same manufacturer and have compatible electronic results output. Acceptable test equipment manufacturer is Fluke Networks. Unless the manufacturer specifies a more frequent calibration cycle, calibration date shall not be more than a year from cable test date. Recommended test equipment is a Fluke Networks DSX-5000 /

8000 Versiv Cable Analyzers using VCSEL fibre modules (preferred) for multimode testing and/or OptiFiber OTDR (if advised by CoT-IT).

- The calibration of equipment shall be valid within one (1) year of the test date.
- Fiberoptics test equipment shall meet the following minimum criteria:
  - Test equipment shall be capable of measuring relative or absolute optical power in accordance with TIA-526-14, "Optical Power Loss Measurement of Installed Multimode Fiber Cable Plant."
  - Test equipment shall be capable of measuring relative or absolute optical power in accordance with TIA-526-7, "Optical Power Loss Measurement of Installed Single-mode Fibre Cable Plant."
  - Test equipment shall not include the loss or length of the test jumpers in the cable plant measurements.
  - Multimode test equipment shall incorporate both 850nm and 1300nm VCSEL/LED sources.
  - Single-mode test equipment shall incorporate both 1310nm and 1550nm laser sources.
  - Sources and meters shall automatically synchronize wavelengths to prevent calibration-related errors.
  - Test equipment shall employ a communications port to facilitate uploading of saved information from tester to PC.
  - Test equipment capable of measuring a Tx/Rx fibre pair simultaneously is recommended to enhance productivity. It is recommended that test equipment utilizing dual function main and remote units be used for bi-directional testing, eliminating the need to swap optical source and power meter.

#### CABLE TEST RESULTS MANUAL

- Consulting Engineer shall first review and comment on the test report. CoT-IT shall only receive the report after the review and approved comments of the Consulting Engineer. CoT-IT will finally provide their final review comment.
- Submit test reports in both a hardcopy and electronic format (native file). Hand-written test reports are not acceptable. If test results cannot be converted to a PDF format then provide any necessary proprietary/native software to view the results at no cost to the City.

- Fibre optic backbone cable test results shall be incorporated in the City of Toronto, Network - Cable Test Results manual. Submit two (2) copies of the Cable Test Results manual for each facility. The manual consists of hardcopy test result reports placed into lockable 'D' ring binders with a cover and spine that clearly indicates the title of the manual. Put a CD with the electronic copies of test reports in a pocket in the Cable Test Results manual.
- The Contractor (RCDD) PM must sign hardcopy reports before submitting it to the Consultant.

### TEST COMPLIANCE SHEET

- A compliance sheet shall be prepared for every project of City of Toronto - IT. The criteria is summarized as below:

1	Test equipment with latest software version	8	Test results limits - TIA
2	Test equipment with latest test limit version	9	Test results based on VCSEL/LED Encircled Flux for OM4
3	Calibration of test equipment	10	Test results based on Laser for OS2
4	Test results submitted in native format and PDF format	11	MM testing at 850nm and 1300nm wavelength
5	Test result cable ID in compliance	12	SM testing at 1310nm and 1550nm wavelength
6	Permanent Link testing performed on copper (CAT6/6A)	13	Bi-directional testing
7	Test result cable type (copper and fibre) in compliance	14	Accurate quantity of adapters and splices

### SITE ACCEPTANCE TEST (SAT)

- A Site Acceptance Test (SAT) will NOT test functionality of the system or its components. Site Acceptance Tests will evaluate the workmanship and verify installation against the *Installation* and *Layout* drawings.
- The SAT plan shall be submitted to CoT-IT, two (2) weeks in advance of commencement.

- The SAT plan shall have a checklist and identify tests with a schedule for CoT-IT to review and coordinate staff. Submit to the Contract Administrator/Project Manager and Consultant, three weeks prior to the commencement of the test, for review. The Contractor shall conduct the test when directed by the Contract Administrator. As a minimum, the Contract Administrator/Project Manager, Consultant and CoT-IT shall witness the test.
- The plan shall be sealed by the Installation Project Manager RCDD, followed by the RCDD Consultant.
- Prior to SAT, the Consultant shall review and approve all copper and fibre cabling testing, bonding and grounding inspections and any other criteria as may be described in the project tender.
- The SAT shall evaluate workmanship and verify construction and components against the Layout Drawings and associated Component Schedules submitted to and reviewed by the Consultant.
- The SAT shall be completed only when all items in the checklist have been witnessed and installed by the Contract Administrator/Project Manager, Consultant and CoT-IT as being in conformance with the design as specified.
- SAT of Equipment Room / Telecom Room
  - Each facility shall have one or more equipment room / telecom room, which house the server and network core closets. Each equipment / telecom room shall undergo a witnessed SAT.
  - The Consultant is responsible for the equipment / telecom room UPS, lighting panel and any ER/TR modifications noted in the tender drawings and specifications. The extent of ER/TR modifications varies for each facility.
  - In addition to the above, the ER/TR SAT shall include the evaluation of the server and core closet installation, power supplies to each closet and external cable management (e.g. cable tray). For the purpose of the ER/TR SAT the server and core closets shall be empty except for the installation of duplex receptacles to receive the UPS.
- SAT of Telecom Enclosure
  - As a minimum, the complete Telecom Enclosure for the SAT shall include the installation of copper patch panels, fibre patch panel, power supplies, horizontal cable terminations, cable management and patch cords.
  - At each facility, the Contractor shall provide one complete telecom enclosure, associated accessories and horizontal cable for the SAT. Following acceptance, the Contractor will be directed to proceed with the installation of the remaining TEs and horizontal cabling. The Contractor is to note that the fibre optic backbone cable installation will be included in the core closet SAT.

- The City reserves the right to do a random inspection of the telecom enclosure and those that do not comply with the above shall be made compliant at no expense to the City.

## FIELD SUPPORT

- Provide 160 hours of on-site support for each facility beginning immediately after successful site acceptance test at that facility for a period of 24 months following Substantial Performance.
- Respond within 24 hours to a request for on-site support.
- The minimum site time per support call will be four (4) hours.
- The cost for the on-site field support shall be paid based on the rates quoted in the Schedule of Prices.

## MAINTENANCE

- For a period of twelve (12) months following Final Acceptance, the Contractor shall provide a qualified technician/electrician to assist in the resolution of network related problems. The Contractor shall be given twenty-four (24) hours notice as to their requirement on-site.
- The Contractor will be compensated at the per diem rate quoted by the Contractor in the Form of Tender. However, if the source of the problem is discovered to be a result of work or components supplied by the Contractor, the Contractor shall not be compensated.

## WARRANTY

- Testing and certification of the Building Network Distribution Cabling System shall be by the installer and shall include the provision of a Belden Warranty covering performance, products and installation.
- The Warranty shall cover the full repair and/or replacement of any component failing or failure to meet the design requirements within one (1) year.
- Warranty shall be delivered by the Contractor in coordination with Belden to the Client's Project Manager with the Testing and Certification documents. The project site shall receive manufacturer's plaque. All coordination regarding warranty and handing over of the manufacturer's plaque is the responsibility of the Contractor.

- The manufacturer shall warrant the project for twenty-five (25) years against application assurance and extended product manufacturing defects.
- The Contractor shall warrant installation against all product installation defects and that all approved cabling components meet or exceed the specified requirements for a period of twenty-five (25) years following acceptance.
- The Contractor shall warrant that all permanent fibre optic links meet or exceed the performance requirements of TIA-568.3 for multimode and singlemode fibre.
- The Contractor shall warrant that all permanent twisted pair links meet or exceed the performance requirement of TIA-568.2 for category 6/6A, unshielded twisted pair.
- Contractor must provide complete end to end mapping of all connectivity at the end in both hard and softcopy formats. This includes but not limited to horizontal data / voice cable number, copper and fibre backbone cable and active equipment ports.
- Within ten (10) days after testing, the cable installer shall provide the Project Manager with documentation, which shall include cable test results, a marked-up copy of the as-built cable network drawing and an electronic copy of the completed installation in Bentley Microstation Ver. 8 and AutoCAD or as per City's CAD guidelines.
- Contractor shall provide a manufacturer written certificate, plaque and warranty that the structured cabling platform is installed and fully operating in accordance with this standard and manufacturers specification.
- The warranty must guarantee that the design or installation negligence on the part of the Cabling Contractor shall not negate or void any portion of the certified system. The manufacturer must guarantee that all material, components and labour are covered in this circumstance for the full certification period of twenty-five (25) years. It must also guarantee that in the event a Cabling Contractor is no longer able to service the warranty, the full certification remains valid and is responsibility of the manufacturer.
- If a warranty issue arises for the cabling, the Warrantor must make arrangements to undertake the repair or replacement of warranty issues within 24 hours of notification. This may require the repair/replace of cabling components outside regular working hours at no additional cost.
- The warranty for the cabling must be such that the cable meets or exceeds the requirements of TIA-568 'Transmission Performance Specifications for 100 Ohm 4-pair Category 6/6A Cabling' including all Standards stated in this Contract.
- The Cabling Contractor shall forward the Structured Cabling Platform certification request form(s) to the proper authority and ensure that a Plaque and Certificate is issued to the Customer / Project Site along with the Structured Cabling Platform user manual. The successful bidder shall provide a certification number within two weeks of award of this project. Please

note that the Plaque/Certificate must have the Customer name/Project name on the Plaque/Certificate.

- The Cabling Contractor shall provide letter(s) of Certification within two weeks of substantial completion of the project to the Customer. This document will include the following: verification of the performance of the installed system, identification of the installation by location and project number and a copy of the warranty.
- Upon request and at no additional cost to the Customer the Cabling Contractor must provide a manufacturer's technical representative to conduct an on-site visit to ensure complete technical compliance.
- The Cabling Contractor must supply a copy of an unexecuted warranty statement (at the time of bidding) including all related terms and conditions. This copy shall be the Standard to which the warranty will be held. No changes shall be accepted unless it is deemed to benefit the Customer. Any proposed changes to the warranty must be submitted in writing to the Customer/their representative for review. The changes will then be accepted or declined by the Customer at their discretion. This is to remain valid for the entire warranty period.
- All cable Cabling Contractor technicians on site must be trained by the manufacturer of the Structured Cabling Platform being installed.
- Any defective or improperly installed products shall be replaced, or correctly reinstalled at no cost to the Customer.

## QUALIFICATIONS AND TRAINING

- An on-site training may be required for the Client to understand the system and installation.
- Contractors shall be certified with Belden and Fluke Networks to perform installations and testing.
- Contractors must have an RCDD installation Project Manager.
- Technicians who have not completed any certification program shall not pull, terminate or otherwise be involved in the installation of the telecommunications physical infrastructure with the exception of bonding to ground.
- Installers performing the testing (SAT, Acceptance, Commissioning, etc.) shall be certified CCTT on Fluke DSX and/or Optifibre OTDR.
- All Fluke credentials shall be submitted to the City during project award process for validation.
- The testing equipment shall be valid and calibrated within one (1) year as per manufacturer specifications.

- The cable installer shall have full working knowledge of cabling low voltage applications such as, but not limited to, Non-Secure Data/Voice communications cabling systems.
- Provide references of the type of installation provided for in this specification.
- Have knowledge of all applicable Telecommunication Standards such as but not limited to: CSA, TIA, IEEE and ANSI.
- Have experience in the installation of pathways and support for horizontal and backbone cabling.
- Be experienced in the installation and testing of telecommunication network cabling system, including the use of a light meter and OTDR.
- Provide proof of being a manufacturer certified installer for all cable network components being installed such as but not limited to cables, connectors and end termination equipment. The use of a non-manufacturer certified installer is not permitted.

#### AS-BUILT DRAWINGS

- The drawings shall include cable routes and outlet locations.
- Outlet locations shall be identified by their sequential number as defined elsewhere in this document.
- Numbering, icons and drawing conventions used shall be consistent throughout all documentation provided.
- For new infrastructure project, the Consultant shall provide the design drawings / tender drawings / floor plans in paper and electronic (Microstation) formats on which as-built construction information can be added.
- For an existing infrastructure upgrade, the Owner may provide floor plans in paper and electronic (Microstation) formats on which as-built construction information can be added.
- These documents shall be modified accordingly by the Telecommunications Contractor to denote as-built information as defined above and returned to the Owner.
- The Contractors shall annotate the base drawings and return a hard copy (same plot size as originals) and electronic (Microstation) form.

## FINAL ACCEPTANCE

- Once all work has been completed including all documentation submissions, the City will notify the satisfaction to the Consultant in writing of formal acceptance of the system.
- Consultant must warrant in writing that 100% of the installation meets the design requirements as specified.
- Contractor must warrant in writing that 100% of the installation meets the requirements specified in the tender documents.
- The CoT-IT reserves the right to conduct, using Contractor equipment and labour, a random re-test of up to five (5) percent of the cable plant to confirm documented results. Any failing cabling shall be re-tested and restored to a passing condition. In the event more than two (2) percent of the cable plant fails during re-test, the entire cable plant shall be re-tested and restored to a passing condition at no additional cost to the Owner.
- Acceptance shall be subject to completion of all work, successful post-installation testing which yields 100% PASS rating and receipt of full documentation as specified.
- The City may agree to allow certain cable runs to exceed acceptable standardized performance criteria. If required these cable runs will be exempt from meeting the specified standards. However, the Contractor will still be required to test these cable runs to validate component and installation performance.
- Documentation: The Contractor shall submit the following documentation for final acceptance:
  - City of Toronto - IT Network — Cable Test Results Manual.
  - Cable Acceptance Test (CAT) – Compliance Sheet
  - Site Acceptance Test (SAT)
  - As-built Drawings and Documents (ADD)
  - Consultant Review and Comments (CRC)
  - CoT-IT Approval of Satisfaction (AoS) – Signing off

## APPENDIX-B: SAMPLE OF SITE ACCEPTANCE TEST (SAT) DOCUMENTS

## Checklist of Telecom Enclosure (TE) / Network / Core Closet Site Acceptance Test (SAT)

<b>Facility:</b>	<b>Project Name:</b>
<b>Contract No.:</b>	<b>Telecom Enclosure / Network / Core Closet Tag:</b>
<b>Building:</b>	<b>Sub-Location:</b>
<b>Consultant:</b>	<b>Contractor:</b>
<b>Date:</b>	<b>CoT-IT Staff:</b>

**TELECOM ENCLOSURE (TE) / NETWORK / CORE CLOSET LAYOUT AND AS-BUILT DRAWINGS****Procedure:**

- Verify that the as-built drawings are present.
- Verify the Telecom Enclosure components match the bill of materials.
- Verify equipment layout is as shown in the as-built drawings.
- Verify all components are tagged and wiring is labeled as per the drawings. (Enclosure, Patch Panels, Copper Patch Panel(s) Work Area Outlets, Cables, Power Distribution Components, etc.)
- Verify the horizontal and backbone fibre cable terminations and labeling.

If any comments are necessary, enter a note number in the test form column and record the comment in the comments form at the end of this document.

**Acceptance Criteria:**

Telecom Enclosure construction and labeling shall match the as-built drawings.

As Built Drawings Verification			
Item No.	Description	Pass/Fail	Notes
1	As built drawings present		
2	Bill of materials in compliance		
3	Layout / arrangement of components in compliance		
4	All components tagged as per as-built drawings. (Enclosure, Patch Panels, Copper Patch Panel(s) Work Area Outlets, Power Distribution Components, etc.)		
5	All wiring labeled as per as-built drawings		

**Power and Fusing Verification****Procedure:**

Verify that the indicated circuit breakers or fuses are installed and labeled with the indicated rating and source and destination distribution panel, breaker position ID. Refer to as built Telecom Enclosure wiring diagrams for the required circuit protection and rating. Record the installed protection device rating.

If the indicated installed circuit protection device matches the required rating enter PASS in the test form column.

If any comments are necessary, enter a note number in the test form column and record the comment in the comments form at the end of this document.

**Acceptance Criteria:**

Installed fuses and circuit breakers shall match the required specifications and labeled accordingly. The correct equipment is powered by the fuse and/or circuit breaker as shown on the as-built electrical drawings.

TE AC Power, Fusing and Tagging/Labeling Verification						
Circuit Breaker / Fuse ID	Description	Required Rating	Installed Rating	Pass / Fail	Source / Destination ID	Notes
120V AC UPS Power Supplementary Protectors						
SP02	UPS Receptacle and UPS Pilot Light (if applicable)	15A				
120V AC Hydro Power Supplementary Protectors						
SP01	Surge Suppressor and Utility Pilot Light (if applicable)	15A				
SP03	Panel Light	5A				
SP04	Utility Receptacle	15A				

**Grounding & Bonding Verification****Procedure:**

Verify that the indicated component is properly connected to the ground.

- Switch off system power.
- Verify the installation of the ground connection between the grounding bus or common ground terminal and the indicated component.
- Measure the DC resistance between the grounding bus or common ground terminal and the indicated component.
- Record the measured DC resistance between the ground connection and the component.

If the indicated grounding connection is installed and meets the maximum DC resistance specification enter a PASS in the test form column. If any comments are necessary, enter a note number in the test form column and record the comment in the comments form at the end of this document.

**Acceptance Criteria:**

The grounding or bonding conductor is installed and the DC resistance measurement must be less than or equal to 0.2  $\Omega$  between termination points.

Telecom Enclosure (TE) Grounding & Bonding Verification				
Grounding / Termination Point	Ground Conductor Visual Inspection	Resistance $\Omega$ Measured	Pass / Fail	Notes
Surge Suppressor		$\Omega$		
UPS Receptacle / Isolated Ground		$\Omega$		
Utility Receptacle		$\Omega$		
Enclosure Door		$\Omega$		
APC Power Bar		$\Omega$		
Rack Mount Ground Bus		$\Omega$		

**Spare Parts, Loose Shipped Components, TE - Bill of Material Verification****Procedure:**

Verify all spare parts and loose shipped components as required in the as-built drawings and bill of material are present. Typical items may be Fiber Optic Patch Cables, Copper Patch Cables, etc.

Enter PASS in the test form column if parts are present. If any comments are necessary, enter a note number in the test form column and record the comment in the comments form at the end of this document.

**Acceptance Criteria:**

Spare parts and loose shipped components are present as required.

Spare Parts and Loose Shipped Items			
Item No.	Description	Pass / Fail	Notes
1	Drawings		
2	Fiber Optic Patch Cords		
3	Copper Patch Cords
