SB-3 TABLE 2 NOTES - FIRE & SOUND RESISTANCE OF FLR.'S, CEILINGS & ROOFS

NOTE 5: Sound absorptive material includes
(i) fibre processed from rock, slag or glass, and
(ii) loose-fill or spray -applied cellulose fibre.

NOTE 6: The fire-resistance rating and sound transmission class values are based on the spacing of the ceiling supports as noted. [See also Table Note (10)]. A narrower spacing will be detrimental to the sound transmission class rating, but not to the fire-resistance rating.

NOTE 7: To obtain the listed rating, the type and spacing of fasteners are as described in and installed in accordance with Subsection 9.29.5. of Division B or CSA A82.31-M1980, "Gypsum Board Application".
(i) fastener distance to board edges and butt ends shall be no less than 38mm, except for fasteners on the butt ends of the base layer in ceilings with two layers (see Figure 2), and
(ii) fasteners are spaced not more than 305mm o.c.

NOTE 8: See Sentence 1.2.1.(2) in MMAH Supplementary Standard SB-2, "Fire Performance Ratings" for the significance of fire-resistance ratings.

NOTE 9: The sound transmission class values given in the Table are for the minimum depth of structural member noted in the description and applicable Table notes. To obtain sound transmission class values for structural members deeper than that minimum, add 1 to the sound transmission class value in the Table for each 170mm increase in structural member depth.

NOTE 10: The sound transmission class values given in the Table are for the minimum depth of structural member noted in the description and applicable Table notes. To obtain sound transmission class values for structural members deeper than that minimum, add 1 to the sound transmission class value in the Table for each 170mm increase in structural member depth.

NOTE 11: The impact insulation class values given are for floor assemblies tested with no finished flooring.

NOTE 12: Wood floor joists are:
(i) wood joists with a minimum member size of 38mm (widht) x 235mm (depth), except as otherwise noted [See Table Note (15)], or
(ii) wood I-joists with a minimum flange size of 38mm x 38mm, a minimum OSB or plywood web thickness of 9.5mm, and a minimum joist depth of 241mm.

NOTE 13: Except where assemblies with wood I-joists are tested according to CAN/ULC-S101-14, "Fire Endurance Tests of Building Construction and Materials", the fire-resistance rating values apply only to I-joists that have been fabricated with a phenolic-based structural wood adhesive complying with CSA O112.10-08, "Evaluation of Adhesives for Structural Wood Products (Limited Moisture Exposure)". For I-joists with flanges made of laminated veneer lumber (LVL), the fire-resistance rating values apply only where the adhesive used in the LVL fabrication is a phenolic-based structural wood adhesive complying with CSA O112.9-10, "Evaluation of Adhesives for Structrual Wood Products (Exterior Exposure)".

NOTE 15: The fire-resistance rating value within square brackets only applies to assemblies with solid wood joists and is achieved only where absorptive material includes:
(i) fibre processed from rock or slag with a minimum thickness of 90mm and a minimum surface area mass of 2.8kg/m², or
(ii) spray-applied cellulose fibre with a minimum density of 50 kg/m³ and a minimum depth of 90mm on the underside off the subfloor and of 90mm on the sides of the floor joists

NOTE 16: The fire-resistance rating, sound transmission class and impact insulation class values given are also appicable to assemblies with 38mm (width) x 184mm (depth) solid wood joists.

9.19.1.1. Required Venting
(1) Except where it can be shown to be unnecessary, where insulation is installed between a ceiling and the underside of the roof sheathing, a space shall be provided between the insulation and the sheathing, and vents shall be installed to permit the movement of air from the space to the exterior.

9.19.1.2. Vent Requirements
(1) Except as provided in Sentence (2), the unobstructed vent area shall be not less than 1/300 of the insulated ceiling area.
(2) Where the roof slope is less than 1 in 6 or in roofs that are constructed with roof joists, the unobstructed vent area shall be not less than 1/150 of the insulated ceiling area.
(3) Required vents are permitted to be roof type, eave type, gable-end type or any combination of them, and shall be distributed,
(a) uniformly on opposite sides of the *building*,
(b) with not less than 25% of the required openings located at the top of the space, and
(c) with not less than 25% of the required openings located at the bottom of the space.
(4) Except where each roof joist space referred to in Sentence (2) is separately vented, roof joist spaces shall be interconnected by installing purlins not less than 38 mm by 38 mm on the top of the roof joists.
(5) Vents shall comply with CAN3-A93-M, "Natural Airflow Ventilators for Buildings".

9.19.1.3. Clearances

(a) provide an unobstructed air space between the insulation and the underside of the roof sheathing, that is,
(i) not less than 25 mm in dimension, and
(ii) of sufficient cross area to meet the *attic or roof space* venting requirements of Article 9.19.1.2., and
(b) extend vertically not less than 50 mm above the top of the insulation.
(3) Ceiling insulation shall be installed in a manner that will not restrict a free flow of air through roof vents or through any portion of the *attic or roof space*.

(Updated January 1, 2025)
A-3.8.3.12.(1) & (3) Universal Washroom
Unobstructed areas in front of the lavatory, in front of the water closet and on one side of the water closet are necessary for manoeuverability of a wheelchair. The door swing may overlap the turning circle within the universal washroom as long as there is sufficient space for a wheelchair user to manoeuver to clear the door and close the door from a front approach position.

The space for an adult size change table may encroach upon the 1700mm turning circle only where the change table is movable and is not permanently fixed or stored within the washroom. In that case the table, such as a hospital gurney is brought into the washroom when needed and removed after use. A permanently fixed table may not be appropriate for certain building occupancies due to operational and maintenance considerations.

DOORWAY AND DOORS

3.8.3.3. Doorways and Doors

(1) Every doorway that is located in a barrier-free path of travel shall have a clear width of not less than 850 mm when the door is in the open position. (See Note A-3.8.3.3.(1))

Appendix A
A-3.8.3.3.(1) Doorway Width
Every doorway that is located in a barrier-free path of travel must have a clear width of not less than 860mm when the door is in the open position and therefore it is important that this dimension be measured correctly. The 860mm clear dimension has been developed from research which shows that this dimension provides access for 95% of wheeled mobility devices.

The clear width of not less than 860mm is measured from the face of the door to the outside edge of the stop on the door frame. It is not sufficient just to measure the inside width of the door frame or the width of the door panel. There should be no projections into the required clear opening width lower than 865mm above the finished floor or ground. Projections into the clear opening width between 865mm and 2030mm above the finished floor or ground should not exceed 100mm.

Other factors, including location of door stops other than on the door frame, and the installation of door closers and exit devices, should be taken into account. The intrusion of a door handle into the space is of lesser importance. It is recognized that there are many types of door frame and door mounts but the overall objective is to maintain a clear width of not less than 860mm.

UNDERLINED STATEMENT ABOVE IS HWY EXIT (PANIC) DEVICES ARE NOT INCORPORATED INTO THE CLEAR WIDTH CALCULATION. ALL EXIT (PANIC) DEVICES & PUSH BARS ARE TO BE 100mm MAX. IN DEPTH TYP. (COORD. W/ HARDWARE SCH. & SUPPLIERS)

ALL CRITICAL BARRIER FREE DIM.'S TO COMPLY W/ OBC & ANY APPLICABLE ACCESSIBILITY BY-LAWS OF THAT SPECIFIC REGION - AODA GOVERNS OBC. O.B.G. BARRIER FREE REQ.'S ARE TO BE REVIEWED & CONFIRMED BY THE GENERAL CONTRACTOR ON SITE THAT ALL DIM.'S & MIN. CLEARANCES ARE PROVIDED. INFORM THE ARCHITECT OF ANY CONFLICTS PRIOR TO INSTALLING WORK & OBTAIN SUPPLEMENTAL INSTRUCTIONS FROM THE ARCHITECT BEFORE PROCEEDING W/ ANY PART OF THE AFFECTED WORK.

BARRIER-FREE DOORS & DOORWAYS:
PROVIDE STD. DOOR LEAF OF NOT LESS THAN 965mm (IMPERIAL) / 950mm (METRIC) FOR EXIT / EXTERIOR & INTERIOR DOORS, SMALLER TO BE VERIFIED AT SHOP DWG. STAGE).

UNLESS EQUIPPED W/ A POWER DOOR OPERATOR, A DOOR IN A BARRIER-FREE PATH OF TRAVEL SHALL HAVE A CLEAR SPACE ON THE LATCH SIDE EXTENDING THE HEIGHT OF THE DOORWAY & NOT LESS THAN 650mm BEYOND THE EDGE OF THE DOOR OPENING IF THE DOOR SWINGS TOWARD THE APPROACH SIDE & 350mm BEYOND THE EDGE IF THE DOOR SWINGS AWAY FROM THE APPROACH SIDE.

POWER DOOR OPERATORS:
EVERY DOOR THAT PROVIDES A BARRIER-FREE PATH OF TRAVEL THROUGH AN ENTRANCE SHALL BE EQUIPPED W/ A POWER DOOR OPERATOR. WHERE AN ENTRANCE INCORPORATES A VESTIBULE, A DOOR LEADING FROM THE VESTIBULE INTO THE FLOOR AREA SHALL BE EQUIPPED W/ A POWER DOOR OPERATOR.

DOOR OPENING DEVICES THAT ARE THE ONLY MEANS OF OPERATION SHALL BE OF A DESIGN THAT DOES NOT REQUIRE TIGHT GRASPING & TWISTING OF THE WRIST.
